Toulouse has given birth to many distinguished individuals, among whom may be specified Cujas, the greatest civilian of modern times, born here in 1520; Raymond, count of Toulouse, so celebrated in the first crusade; M. de Villele, late minister of France, &c. (*Martinière, Grand Dictionnaire*, art. *Toulous*; *Hugo*, art. *Haute Garonne*; *Dict. Géog.*; *Guide du Voyageur*; *Inglet's Switzerland*.)

TOURNAY (Flem. *Doornik*), a town of Belgium, prov. Hainault, cap. arrond. and of two cantons, on the Scheldt, close to the French frontier, 43 m. W. S. W. Brussels; lat. 50° 36' 20" N., long. 2° 23' 17" E. Pop., in 1836, 28,919. Tournay covers nearly as much ground as Lisle, though so much less populous. Its former fortifications were demolished by the emperor Joseph II., but since 1814 it has been surrounded anew with military works, and has a good citadel. The Scheldt, crossed here by several flying bridges, divides Tournay into two parts, called the Old and New Towns: the latter is well built, and has a fine quay along the river, which forms a favourite promenade; but, excepting its historical recollections, the former has little to render it interesting.

The cathedral, a fine Gothic building, with five towers and spires, supposed to have been a bishop's see as early as the 5th century, was formerly richly adorned, but suffered greatly from the French revolutionary phrensy. The old abbey of St. Martin has been of late years levelled with the ground, to give place to the town-hall and public gardens. Few other buildings are worthy of notice; though there are several hospitals and asylums, including one for aged ecclesiastics, a court of primary jurisdiction, chamber of commerce, exchange, theatre, atheneum, academy of fine arts, episcopal seminary, many good private schools, a *mont-de-piété*, &c. Without the walls are several suburbs. Tournay is one of the most active manufacturing towns of the Netherlands, and must have been celebrated for its industry at a very early period, since it is mentioned in the *Notitia Imperii* of the 5th century as one of the fifteen towns in the empire having manufactures of woollen and linen yarn. At present, Vandermaelen states, that three-fourths of its pop. are employed in its various manufactures, and that from 12,000 to 16,000 looms are supposed to be employed in its commune. (*Dict. de Hainault*.) Hosiery, calicoes, and linen fabrics, camlets, yarn of various kinds, waistcoats, and all kinds of articles of dress, with carpets, for which Tournay is deservedly famous, are the principal articles of trade; but large quantities of earthenware, bronze goods and hardware, curacao, and other liqueurs, are made; and there are numerous breweries, salt-refineries, tanneries, dyeing-houses, &c. Full-aged cotton-spinners get about 1 fr. 35 c. a day, working about 12 or 14 hours; but one-fourth part of the hands employed are children. Weavers get from 1 fr. 25 c. to 14 fr. In the royal carpet factory, the workmen obtain from 2 to 24 fr. a day, though there also many children are employed, who enter at 5 years of age. (*Hand-loom Weavers' Report*.) Tournay has various charitable institutions for the benefit of sick workpeople, for pensioning the widows of weavers, &c., and children are not suffered to be too laboriously employed. (See *Vandermaelen's Dict.*) The Scheldt, which is navigable to the town or vessels of 150 tons, is the principal channel for the conveyance to the town of coals, spices, dyeing materials, tobacco, deals, brandy, wines, and for the export of the manufactured goods, chalk, building stone, oil, &c., produced in the town and its vicinity. Tournay has probably experienced as many vicissitudes as any town in Europe. It is the *Civitas Nerviorum*, taken by Julius Cæsar, and has since belonged to an infinite number of masters, and been taken and retaken over and over again. (*Vandermaelen Dict. de Hainault*; *Dict. Ocog.*; *De Cloet*; *Part. Rps.*)

TOURS (an. *Cæsaromagus*), a city of France, dep. Indre-et-Loire, of which it is the cap.; it is surrounded by extensive and fertile plains, and is itself placed on the narrow tongue of land between the rivers Loire and Cher, close to the point of their confluence, 127 m. S. W. Paris; lat. 47° 23' 49" N., long. 0° 41' 38" E. Pop., in 1836, 25,000. "Tours is well known as a favourite retreat of English absentees. Great part of the town is new; and the streets, several of which are spacious, and the houses clean, substantial, and many elegant, give it an air of ease, pleasure, and abundance, possessed by few other cities in France. The beauty of Tours has arisen since the Revolution, and has, indeed, sprung out of it, for great part of it has been rebuilt upon an improved plan." (*Inglet*, p. 352.) And, in fact, the older parts of the city still consist of narrow, crooked, and dirty streets, with mean and ill-built houses. It is surrounded by planted boulevards on the site of its ancient fortifications; it has 12 different entrances, and 5 suburbs. It communicates with the opposite bank of the Loire by one of the finest bridges in Europe, constructed chiefly between 1762 and 1771; it is of stone, level on the summit, 475 ft. in length by 16 in breadth, and has 15 arches, each 23 yards in span. Over the Cher are two bridges, one of 17 and the other of 8 arches. From the bridge over the Loire a noble street, the *Rue Royale*, straight, spacious, bordered with footways, and lined with uniform buildings of freestone, intersects the town in its entire breadth, terminating on the S. in the *avenue de Grammont*, leading to the smaller bridge over the Cher. At the commencement of this street, close to the Loire, is a handsome square; in which are the town-hall and the departmental museum, new and symmetrical buildings, the latter containing upwards of 200 paintings. The cathedral is said to have been founded in the 4th century, burnt down in the 6th, rebuilt by Gregory of Tours, but again burnt down in the 12th century, after which its reconstruction proceeded so slowly that it was not completed till 1550. It has a noble front, flanked by two towers, built by Henry V. of England. Its interior, though not beautiful, is richly ornamented, and contains much stained glass, together with the mausoleum of the children of Charles VIII. A curious collection of MSS. is kept in this cathedral. The other churches are mostly small and gloomy, and possess little worth notice. The so-called Tower of Charlemagne is the only remaining portion of the abbey of St. Martin, destroyed in 1797, of which the kings of France used to be the abbés. The archbishop's palace is one of the handsomest in the kingdom: the prefecture, court-house, college, general hospital, exchange, theatre, barracks, prison, and a highly ornamented fountain in the market-place, are the other most conspicuous objects. This city is the seat of courts of primary jurisdiction and commerce, a chamber of commerce, council of prud'hommes, societies of agriculture, sciences, arts, &c.; and has courses of practical geometry, a library said to comprise 40,000 volumes, a cabinet of natural history, and botanic garden. It was here that Louis XI. established the silk manufacturers he invited out of Italy; and it was for a considerable period famous for its silks; but it has long been far surpassed in this department by Lyons, which has peculiar advantages for the prosecution of the silk manufacture. Next to that of silk, which is carried on to a considerable extent, the manufactures of Tours consist principally of woollen cloths, carpets, and woollen yarn; but they are not extensive; and the trade of the city is chiefly in the retail supply of its inhabitants and visitors.

The promenades round Tours are charming: among these the elm-avenue is the most conspicuous; the quay is also pleasant. The environs of the city furnish the most agreeable walks; innumerable little paths lead in every direction through the fields, and among the knolls and copses. Tours, 30 years ago, was as cheap a residence as any place on the Loire; but a great advance in the prices of every thing, and particularly house-rent, has naturally followed the approbation of Tours by the English. Immediately after the war, a large house, with every convenience, and a garden of two or three acres, might have been had for 200. a year; but this sum may now be more than doubled. Provisions are still moderate in price, and wood is less expensive than in most other parts of France." Besides the English, Tours is much resorted to by French gentry, who, though in independent circumstances, are not rich enough to afford the expense of living in the metropolis. The castle of *Plaisir* at Tours, built by Louis XI., where he principally resided, is about 1 m. from the city. It is constructed of brick; is embosomed in wood; and has a venerable appearance. In its chapel is a portrait of Louis, dressed in armour, taking off his helmet to the Virgin and Infant. (*Inglet*, p. 354.)

Among the eminent men to whom Tours has given birth, may be specified Cardinal Amboise, prime minister of Louis XII., and Rapin, the author of the much admired Latin poem, *De cultu Hortorum*, and of several critical publications. Rapin has not forgotten to cele-

brate the praises of his native city, and the surrounding country,—

Adde omnem lætam rivis, et fontibus oram,  
Prætorum immenso tractus, et amœna secundum  
Flumina, videturque utroque ex litore colles:  
Quid miror non variis opulentum mercibus urbem,  
Et studia, et mores populi, quem serica textis  
Tractantem, fecit cœli clementia blandum?  
Adde umbra nemorum æternas, et mollis semper  
Gramine præta novo, et nunquam sine floribus hortus.  
Lib. I. line 489, ed. de Broter, Paris, 1780.

Gregourt, the poet, was also a native of Tours, and St. Gregory, hence called Gregory of Tours, was for a lengthened period bishop of the see.

Tours was anciently the cap. of the *Turonet*, conquered by Caesar, anno 55 B.C. In the 5th century, it became the cap. of the 3d Lyonnaise. After many vicissitudes it fell into the hands of the Plantagenets; and formed a part of the English dominions, till 1204, when it was annexed to the French crown. (*Dict. Geog.*; *Hugo* art. *Indre-et-Loire*; *Guide du Voyageur*.)

TOUMEN, a considerable town of Asiatic Russia, gov. Tobolsk, on the Toura, 120 m. S.W. Tobolsk. Pop., in 1835, 9,213. It is situated in a fertile tract, and its inhabs. are said by Cochrane to be both wealthy and hospitable; though, according to Dobell, little can be said in favour of their manners. (*Travels*, II. 115.) In almost every house the manufacture of a coarse kind of carpeting sold all over Siberia is carried on; and its tanneries, which are more extensive than any others in the government, employ nearly 300 workmen, and produce goods to the value of more than 1,000,000 roubles a year. (*Journ. de St. Petersburg*.) In the neighbourhood are extensive forests, and vast quantities of mats, with carriages, and various wooden articles, are made for exportation; besides which the town has a large trade in timber, tallow, hides, embroidery, vegetables grown in the vicinity, cattle, &c. It was the first town founded by the Russians in Siberia, having been built in 1586, on the site of a previous Tartar city called *Tchingis-Tora*, or "the town of Genghis." (*Cochrane*; *Dobell*; *Erman*, *Reise um die Erde*; *Journ. de St. Petersburg*.)

TOURNUS, a town of France, dep. Saône-et-Loire, cap. cant., on the Saône, here crossed by a bridge of 6 arches, between Macon and Chalons, 16 m. N.N.E. the former, and about the same distance S. the latter. Pop., in 1836, ex. comm., 4,480. It stands on a declivity crowned by the remains of a Benedictine abbey, which formerly possessed extensive privileges. It is clean, well-built, and has some good public edifices. Its trade is principally in corn, wine, and building stones, sent down the Saône to Lyons. (*Hugo*, &c.)

TOWCESTER, a market-town and par. of England, co. Northampton, hund. Towcester, on the Tow, here crossed by three bridges, 8 m. S.W. Northampton. Area of par. 2,790 acres. Pop., in 1831, 2,671. The town consists principally of three streets, at the union of the roads from Stony Stratford, Northampton, and Daventry. It stands on the ancient Watling Street, and was probably a Roman station. The church is a neat edifice, supposed to date from the 11th century. The living, a vicarage, worth 217*l.* a year, is in the gift of the bishop of Lichfield and Coventry. Here are chapels for various dissenting sects; a grammar-school, founded at the dissolution of the monasteries, and endowed with part of the revenues of a college dating from the reign of Henry VI.; several almshouses, &c. Markets on Tuesdays: fairs four times yearly.

TRAFALGAR (Cape), a promontory of the S.W. coast of Spain, prov. Andalusia, 25 m. N.W. Tariffa, in the strait of Gibraltar, of which, indeed, it forms the N.W. extremity, lat. 36° 10' 15" N., long. 6° 1' W. This cape, which in antiquity was called the promontory of Juno (*Junonis promontorium*), is low, and terminates in two points, the most easterly of which is surmounted by a round tower.

Cape Trafalgar is famous in naval history for the great battle fought in its vicinity on the 21st of October, 1805, between the combined French and Spanish fleet, under Admirals Villeneuve and Gravina, and the English fleet under Lord Nelson. The former had 33 sail of the line and 7 large frigates, while the fleet of the latter only amounted to 27 sail of the line and 3 frigates, but the superior skill and gallantry of the British admiral, and of his officers and men, far more than compensated for the nominal inferiority of the English fleet, and secured for the country the greatest naval victory recorded in her annals. No fewer than 19 French and Spanish line of battle ships were captured, and 4 that had escaped from the action were subsequently taken by Sir Richard Strachan; the other vessels that escaped into Cadiz being, at the same time, mostly rendered unserviceable. Unfortunately this great and decisive victory was not acquired without a very heavy loss. Nelson, who was mortally wounded early in the action, lived only to be made aware of the destruction of the enemy's fleet.

TRAJANOPOLI (called by the Turks *Orthohovo*), a town of European Turkey, prov. Roudolia, sanj.

Gallipoli, on the Maritza, 45 m. S.S.W. Adrianople, lat. 41° 7' 30" N., long. 26° 18' 15" E. It is said to have a population of 15,000 inhabitants; is the see of a Greek archbishop, and has a considerable commerce; but it lies so much out of the routes usually resorted to by travellers, that we have but little information respecting it.

TRALEE, a parl. bor. and marit. town of Ireland, prov. Munster, co. Kerry, of which it is the cap., within about 2 m. of the head of Tralee Bay, near the Ballymullen river, 55 m. N.W. Cork. Pop. of parl. bor., which includes an area of 534 acres, in 1831, 9,502, and now (1842) probably 13,000. Tralee is a rapidly-increasing, thriving town. At the close of the late war it was little else than a congregation of cabins; but now, to use the words of Mr. Inglis, "it has streets that would not disgrace the best quarters of any city; and these not streets of business, which it also has, but streets containing gentlemen's houses, or, at all events, houses which no gentleman might be ashamed to live in. I have no hesitation in pronouncing Tralee altogether the most thriving town I have seen since leaving Clonmel; and in some respects it leaves Clonmel behind it. Its retail trade is extensive and improving, and many of the dealers are wealthy. As good shops are to be found in Tralee as in Cork; and the stock in many of them is very extensive. I was at Tralee on a market day, and I do not recollect to have seen a busier place. Independently of an extensive supply of country produce, there was a very abundant exhibition of all kinds of manufactured goods and apparel, and every shop in the town was crowded to the door. House rent is high here; higher, in fact, than in any English co. town. There is a spa in the vicinity a good deal resorted to for its waters: its situation is pleasant, and a number of pretty country houses have been erected in the neighbourhood." (i. 252, 263.)

The public buildings and establishments comprise a handsome par. church, two large Rom. Cath. chapels, a nursery, to which an excellent school for girls is attached, several meeting-houses for dissenters, a new county court-house, "which is in every way a handsome and commodious structure" (*Inglis*), a fever hospital, a lunatic asylum, a county infirmary, infantry barracks for 600 men, two breweries, a distillery, &c. The town stands on the estate of Sir Edward Denny, who has thrown open the pleasure-grounds, attached to the castle in its immediate vicinity, to the inhabs. Sir E. Denny is also patron of the living of Tralee, worth above 400*l.* a year. Exclusive of the girls' school, Tralee has a Catholic free-school, and other schools, two of which are subordinate to the Board of Education in Dublin. It sent 2 mems. to the Irish H. of C., and since the union it has sent 1 mem. to the Imperial H. of C. Previously to the Reform Act the right of election was nominally vested in the old corporation, dissolved by the act 3 & 4 Victoria, cap. 108.; but it was, to all intents and purposes, a nomination bor.; and it is stated by the Boundary Commissioners, "that it has generally happened that the people of the town and their parliamentary representative were total strangers to each other; and it is a fact worth mentioning, that several intelligent and respectable persons, amongst whom was the provost himself, could not tell us the name of the present member!" Reg. electors, in 1839-40, 296.

The co. assizes are held here; and general sessions four times a year; and petty sessions on Tuesdays. It is, also, a constabulary and coastguard station. Markets on Tuesdays and Saturdays: fairs May 3, Aug. 4, Oct. 9, Nov. 7, and Dec. 13. Post-office revenue, in 1830, 1,237*l.*; in 1836, 1,511*l.* The Provincial Bank had a branch opened here in 1828, the Bank of Ireland and the National Bank in 1835, and the Agricultural in 1836.

The port is included in that of Limerick. Owing to the shallowness of the water in the river, barges of more than forty tons were, till lately, loaded and unloaded at Blennerville, about 2 m. S.W. from the town, while vessels of greater burden were compelled to load and unload by means of lighters, at the Sapphire Islands, in the bay about 6 m. W. from the town. In the view of obviating this inconvenience, a ship canal, 15 ft. deep, has been cut from the bay to a basin adjacent to the town, where vessels of 300 tons may now load and unload. If this canal have the success that has been anticipated, it will be of great service to the trade of Tralee. The value of the exports, which principally consist of corn and provisions, amounted, in 1836, to 42,315*l.*

It is a singular and not easily-explained fact, that, notwithstanding all the proofs of prosperity found in Tralee and its vicinity, wages are extremely low, employment scarce, and the condition of the lower classes very much depressed.

TRANI, a sea-port town of S. Italy, kingd. Naples, prov. Terra di Bari, cap. cant. on the Adriatic, 35 m. N.W. Bari, lat. 41° 17' 5" N., long. 16° 29' 35" E. Pop. 13,000. It is surrounded by a bastioned wall,

with a fosse on the land side, and has a citadel, but is not a place of any strength. The streets, which are narrow and dirty, are flanked with ill-built houses, except round the port, where there are some private dwellings that would not disgrace the best part of Rome. Its large cathedral, erected more than six centuries ago, is said by Swinburne to be in a very mean taste, with preposterous ornaments and clumsy pillars. Exclusive of the cathedral it has about 20 other churches, with 6 convents for monks (one of which, the monastery of St. Clare, is a magnificent structure), 2 nunneries, an orphan asylum, a large seminary, and a theatre, said to be inferior only to those of Naples. Trani is the seat of one of the great civil courts of the kingdom, of a superior criminal court, of a civil tribunal for the prov., and is the residence of many old families. It labours under a great deficiency of spring water, so that the inhabitants are obliged principally to depend on rain water collected in cisterns. It exports corn, oil, sweet wine of good quality, figs, almonds, and sweets of the vicinity. Some cotton stuffs are produced in the town, of cotton raised in the cant. The ramparts command a fine view both towards the interior and the sea.

The harbour, which is nearly enclosed by the town, has naturally deep water, but owing to the accumulation of sand thrown in by the sea, and of the filth from the surrounding houses, it is so much filled up as to be accessible only to the smallest boats, while in summer the stench is intolerable. Of course, were it in the hands of a vigorous enterprising people, it would be very soon cleaned out. The few vessels that carry on the languishing trade of the town are obliged to anchor about a 2 m. off shore, being laden by lighters.

In 1502 a contest took place under the walls of this town, between 11 French, and as many Spanish knights. The combatants fought till there remained only 6 Spanish and 4 French knights: the latter then alighted and defended themselves behind their horses, as behind a rampart, till night put an end to the contest. (*Swinburne's Two Sicilies*, l. 180; *Craven's Tour*, p. 92; *Rampoldi*, &c.)

**TRANQUEBAR**, a town and sea-port of Hindostan, belonging to Denmark, on the Coromandel coast, surrounded by the British district of Tanjore, between two arms of the Cavery, 140 m. S.S.W. Madras, lat.  $11^{\circ} 0' 15''$  N., long.  $81^{\circ} 54' 30''$  E. Pop. of the town and its small territory about 20,000. Tranquebar is surrounded by bastioned ramparts faced with masonry, and at its S.E. angle is the citadel of Dansburgh, in which is an old castellated building, serving for the government offices, and having a light-house on its highest point. The town is small but very neat and clean, there not being a native hut or other mean structure within its walls. The principal streets may be called handsome, the whitened houses being of two or three stories, with little Grecian porticoes of three or four pillars projecting into the street, and windowed generally with rattan lattices. The government house, two Protestant churches and a Portuguese Roman Catholic chapel are in the town, the religious missions at Tranquebar are said by Malcolm to have greatly declined of late. (*S.E. Asia*, l. 68.) There is no harbour in the Cavery for vessels of a larger class than boats, which have accordingly to anchor outside the surf in the bay. It has, however, some traffic by sea with Bengal, the Malabar coast, the Straits settlements, Ceylon, &c.; it has also manufactures of salt, and cotton goods. The revenues are derived from the government share of the rice cultivation, the sale of arrack, tobacco, fish, oil, &c., and the customs, but they are scanty. (*E. I. Gazetteer*, &c.)

**TRANSYLVANIA** (Germ. *Stebenbürgen*, Magy. and Slav. *Erdeli*, an. *Dacia Mediterranea*), the most E. prov. of the Austrian empire, comprised between the 45th and 48th degs. N. lat., and chiefly between the 22nd and 26th E. long., having Hungary on the N. and W., and on the E. and S. Moldavia and Wallachia, from which it is separated by the main chain of the Carpathians. It is of a square shape: greatest length and breadth about 140 m. each. Area estimated at 20,400 sq. m. Pop., in 1839, 2,066,900. (*Berghaus, Adg. Länder*, &c.) Most part of the surface is covered with ramifications of the Carpathian mountains, which rise in Mount Bukhest, near Kronstadt, to nearly 8,700 ft. in height; these, however, give place in the N. to the valley of the Szamos, in the centre to that of the Maros, and in the S. to that of the Aluta. All these rivers, of which the Maros is the principal, rise in Transylvania, and have, more or less, a W. course, the general slope of the country being towards the W. The first two are tributaries of the Theiss, the last joins the Danube in Wallachia: the banks of all, and particularly the Maros, are densely wooded (whence the modern name of the prov.), and possess considerable picturesque beauty. It is in general well watered, and in the S. are some extensive marshes. As the country at large is rather an elevated table land, the climate is cold, though in most parts healthy. The soil is of very various qualities; the

mountains are generally granitic or calcareous, but the plains and valleys are often very fertile, and, notwithstanding the backwardness of agriculture, a surplus of corn over the quantity required for home demand is generally produced. Wheat, barley, oats, rye, buck wheat, and maize, most kinds of pulse, potatoes, and garden vegetables, are cultivated; wine is one of the leading products of the country; in the orchards apples, pears, plums, apricots, almonds, mulberries, chestnuts, &c., are grown; and tobacco, hemp, flax, saffron, and clover, are ordinary crops. The lands are, in general, held under a feudal tenure, as in Hungary, except in the Saxon-land, which division of the province is by far the best and most industriously cultivated.

Transylvania is divided principally among three distinct nations; the Magyar, the Szekler, and the Saxon, each of which has a share in the government of the country. They inhabit different districts: the Magyars (with the Wallachs) occupy the whole W. and centre; the Szeklers the E. and S.E.; and the Saxons the greater part of the S., with a portion of the N.E. (*Page's*, li. 300, and Map.) The first occupy at least 3-5ths of the entire principality, of which Clujenburgh is the cap., and the Szeklers and Saxons about 1-5th each; Maros-Vasarehy being the chief town of the former, and Hermanstadt of the latter. With these races are intermixed a number of Poles, Gypsies, Jews, Armenians, &c. We subjoin a statement, which is probably not far from accurate, of the number of the different races of people inhabiting Transylvania, and of the numbers attached to the different religions:—

Races of People.		Religions.	
Magyars	500,000	Roman Catholics	450,000
Wallachs, &c.	1,000,000	United Greek	90,000
Szeklers	200,000	Catholic	90,000
Saxons	200,000	Calvinists	400,000
Poles	100,000	Lutherans	200,000
Gypsies	40,000	Unitarians	50,000
Jews, Greeks, Armenians, &c.	20,000	Jews and all other sects	60,000
Total	2,060,000	Total	2,060,000

The Magyars and Wallachs have been already described (*ante*, p. 4, 5, &c.). The Szeklers, termed by the Latin writers of the Lower Empire *Siculi*, are probably the descendants of a barbarian horde that had settled in the province during the decline of the Roman power. The Magyars, on entering the country in the 10th century, finding the Szeklers cognate with themselves in features, language, character, &c., left them in the undisturbed possession of the lands they had inherited, on condition of their guarding the Magyar frontier on that side. They were not even rendered tributary, and to this day the Szeklers hold themselves to be noble born, free, and equal. But in the lapse of centuries many changes have crept into their condition. The richer and more powerful have gradually introduced on their own estates the system in operation in other parts of Transylvania, and the peasant and the seigneur are now found in the Szekler-land as elsewhere. Titles, too, and patents of nobility have been freely scattered through the country; taxation, also, and the forcible introduction of the border system instead of the desultory service of former times, have made great changes. As almost all these changes, however, have been introduced without the consent of the people, and often by the employment of open force, they are still regarded as illegal by the Szeklers, who are consequently among the most discontented of any portion of the Transylvanians. (*Page's*, li. 390, 391.)

The Saxons appear to owe their origin to a colony transplanted thither from the Rhine by one of the sovereigns of Hungary in the 12th century. They live under a count, or chief, who, like their clergy, is elected by themselves; and they enjoy freedom from tolls within their district, and other important privileges. "One of the fundamental laws of the Saxons is the equality of every individual of the Saxon nation. They have no nobles; no peasants. Not but that many of the Saxons have received letters of nobility, and deck themselves out in all its plumes; yet, as every true Saxon will tell you, it is only as Hungarian nobles, not as Saxons. Their municipal government was entirely in their own hands; every village chose its own officers, and managed its own affairs, without the interference of any higher power. But a few years ago, a great and completely arbitrary change was made in this institution, the effects of which have been to deprive the Saxon communities of the free exercise of their privileges, and to deliver them into the power of a corrupt bureaucracy, over which they have little or no control. The Saxons, however, are a slow people, and, though they have long complained, they have scarcely ever ventured to demand a restitution of

\* The religions of the sects thus marked are tolerated only, whereas the others are established, by government.

their rights. Hitherto they have been among the most certain adherents of the crown: they have rarely joined the liberal party. They preserve, for the most part, the dress, language, habits, &c. their ancestors brought with them from Germany. For the rest, the Saxons are undoubtedly the most industrious, steady, and frugal of all the inhabs. of Transylvania; and they are consequently the best lodged, best clothed, and best instructed." (*Ibid.* ii. 428-433, &c.)

The peasants of Transylvania are in a more depressed condition, and much more ignorant, than those of Hungary. Among the greatest evils of which the Transylvanian peasant has to complain, is the want of any well-defined code of laws to which he may refer. The peasant land, too, has never been classed, as in Hungary, according to its powers of production; nor has the size of the peasant's portion, or sief, been accurately determined. The amount of labour, therefore, cannot be fairly and legally proportioned to the quantity and value of the land. Nor is the amount of labour itself better regulated. In some parts of the country it is common to require two days a week; in others, and more generally, three are demanded; and in some the landlord takes as much as he can possibly extract out of the half-starved serfs settled on his estates. It is rare that the peasant's cottage has more than two rooms, sometimes only one; his furniture is scanty and rude, his crockery coarse, and those little luxuries which in the Hungarian denote something beyond the indispensable are rarely seen in Transylvania. The ignorance of the Transylvanian peasant is often intense; and he is generally superstitious and deceitful; these qualities are most conspicuous in the Wallachs, but the Magyars are by no means free from them. Schools are extremely rare. The peasants belonging to the Greek church are undoubtedly the most ignorant; those of the Unitarian and Lutheran churches the best educated.

"We had remarked," says Mr. Paget, "throughout the Szekler-land generally, a better state of cultivation and greater signs of industry than in most other parts of Transylvania. But the Saxon-land, on the Aluta, appeared like a garden in comparison even with the former. The whole plain seemed alive with ploughs and harrows, and on every side teams were moving about, manure was spreading, and the seed was being scattered abroad with a busy hand. The most startling feature in the picture was the very active part taken by the women. Some were sowing corn, others using the fork and spade, others holding the plough, and others driving the team." (*Paget*, ii. 311-316, 425-428.)

Transylvania may hereafter rank high as a wine growing country: it abounds with declivities of a rugged or volcanic soil. No less than 1-9th part of its present pop. is dependent on the culture of the vine; all the gentlemen, and even superior tradesmen, grow their own wines. The mode of making them is very ill understood; but there are several superior kinds of wine produced, mostly in the valleys of the Maros and its tributaries. They are in general white, well flavoured, and full bodied. The highest price in an ordinary year of the better sorts is about 2s. the *rimner* (16 bottles).

The rearing of horses and other live stock is one of the most important branches of national industry. In the Szekler mountains a small wiry horse, similar to the Welsh pony, appears to be indigenous: but, for improved breeds, no less than 60 celebrated studs are said to exist in this small territory, 20 of which have probably a greater or less infusion of English blood, the English breed and modes of treatment of horses having been introduced of late years. Buffaloes, scarce in Hungary, are common here. The sheep, which are long-woolled and curly-horned, are sent into Wallachia to graze in the winter. The oak, beech, &c. forests, which are estimated to cover nearly 3,940,000 acres, feed large quantities of hogs.

Her mineral produce is a principal source of the wealth of Transylvania. There are numerous gold mines in the country, and almost every stream and river is auriferous; the annual produce of gold is estimated at from 2,000 to 2,500 marcs, and of silver 5,000 marcs. (*Austr. Nat. Encyc.*) The gold mines of Zalatna, in the basin of the Maros, are supposed to have been wrought ever since the time of the Romans; and those round Nagy Banyá are certainly of that æra. From the latter, and some other mines, the ore is sent off monthly to Kremnitz, to be smelted. Gold-washing in Transylvania is almost monopolised by the gypsies. Government grants a gypsy band the privilege of washing the sands of a certain brook, on condition of their paying a yearly rent, which is never less than 8 ducats of pure gold per head for every washer. A gypsy captain settles this matter with the government, and is answerable for the rest of the tribe, from whom he collects the whole of their earnings, which he re-divides among them, after paying the tribute. (*Paget*, ii. 384, 385.) Iron, lead, copper, antimony, arsenic, mercury in the form of cinnabar, &c., are also found in Transylvania; and the mines of Izerkerem are

the richest in tellurium of any in Europe, and those in which metal was first discovered. Marshal Marmont states that coal, of very good quality, is found in some parts; but it is not made use of. Salt is much more important: rock-salt abounds at Maros and Szamos-Ujvar, &c., about 600,000 centners being annually produced, which, excepting about 30,000 centners, consumed in the neighbourhood, is wholly exported to Hungary. The miners work from 3 to 11 A. M., and get about 10d. a day. The centner of salt is delivered at the pit's mouth for about the same sum, and sold in Transylvania at 34 flor. or 7s. the centner. The greater part, however, is sent by the Maros to Szegedin at an expense of 10d. more each centner, and sold there at 73 guilder or 15s. the centner. The E. of Transylvania is supplied from mines in the Szekler-land, where Paget (ii. 399.) says he saw an entire hill of salt. This hill, in consequence of the strict monopoly exercised by the government over the article, was surrounded by guards to prevent the peasants from stealing the salt! Alum, sulphur, saltpetre, sulphate of soda, and many crystals and inferior kind of gems, are found in the prov.

Except those of woollen, cotton, and some other fabrics in Cronstadt, Hermanstadt, and other parts of the Saxon-land, few manufactures are carried on to any great extent. Woollen and linen stuffs, cotton fabrics, &c., hats, leather, shagreen, potash, earthenware, paper, and gunpowder are made in different places; the clothing of the peasants being generally of domestic manufacture. Some forges, breweries, and vinegar factories are scattered over the country; but woollen, silk, and linen fabrics, jewellery, hats, glass wares, &c., are principally imported from abroad, in return for salt, corn, cattle, horses, hogs, hides, wax and honey, timber, metals, and other raw produce. The trade is mostly in the hands of the Greeks and Armenians; and, as yet, little facility is afforded for commerce with Hungary and Wallachia. Retail tradesmen, who sometimes have large dealings with Pesth and Vienna, will give money on bills, or transmit considerable sums for a per centage; but there is not one regular banker in the whole country! (*Paget*, ii. 477.) The Maros and Szamos are navigable, and are the chief routes for the conveyance of goods. The roads and bridges are every where in the most wretched state; and, except in a few towns, inns are unknown.

Transylvania sends deputies to the Hungarian diet; but has also a diet of her own, composed as follows:— "Every co. and free town sends its members: the Magyars about 46, and the Szeklers and Saxons 18 each. The Catholic church sends 2 mems., representatives of abbies; the Catholic and United Greek bishops claim each a seat also. Besides these are the *Regalists*. Some of these are nominated by the crown for life; others, as the lords-lieutenant, privy councillors, and secretaries, have seats in virtue of their office. The number of regalists is said to have been limited to 89 by Maria Theresa; but this regulation has been grossly infringed, the present number exceeding 200! A governor, aided by a privy council, secretaries, and others corresponding with the Transylvanian chancery at Vienna, &c. in other words, acting under the direction of an Austrian minister—constitute the executive body, whilst the legislative is formed by a diet to be held every year. The appointment of the executive is vested jointly in the diet and the crown, the former nominating for every office three individuals from each of the received religions, from among which twelve the crown appoints one. Besides the *candidation* of the executive, the duties of the diet may be said to consist in the making and altering of laws for the internal government of the country; the voting supplies of troops; the levying, but not voting, the contribution; and the conferring the *indignat*, or right of citizenship, upon strangers." (*Paget*, ii. 273.)

Magyar Transylvania is divided into 11 counties (3 of which, in the N., have been lately annexed to Hungary); the Szekler-land into 5, and the Saxon-land into 9, *stuhls*, besides some subordinate districts. The government of the Magyar counties and Szekler *stuhls*, and of the towns, is nearly the same as in Hungary: that of Saxon Transylvania has been already noticed. In the cap. of each co. and *stuhl* is a court of primary jurisdiction, subordinate to the Transylvanian chancery at Vienna.

A band or zone of country along the S. and E. frontier, with a pop. of about 140,000, forms the Transylvanian military frontier. Here are maintained two Wallach and two Szekler infantry border regiments, and one regiment of Szekler hussars. The inhabs. of this tract are subject to the Austrian military frontier laws. (See SLAVONIA, *and* p. 695, 696.)

The majority of the clergy, and particularly the Wallach priests of the Schismatic Greek church, are little superior to the peasantry in point of education. Those of the United Greek church are better educated, having a lyceum, gymnasium, and normal school at Balasfalva, and enjoy the same general privileges as the clergy of the Rom. Cath. faith, which is that most favoured by the

government, and entitled to the tithes in case of dispute. The great body of the Protestant clergy is also derived from the poorer classes of society; and its members, during the period of their education, are commonly maintained by the lord of the village to which they belong, till sent to college. Besides 6 gymnasia, the Calvinist church has 4 superior colleges; one of which, that of Enged, stands higher for general education than any other college in Transylvania, and has an annual revenue of 1,000, from funds deposited in the Bank of England. (Paget, ii. 386.) The Lutherans have a college at Cronstadt, and a gymnasium. The government of the Reformed churches in Transylvania is somewhat like that of the Presbyterian church of Scotland, and is described at length by Mr. Paget, ii. 487, 488.

The Unitarian is an established religion only in Transylvania; where it was introduced by the Polish queen of Zapolya I. in the 16th century, and for some time continued to be the religion of the court. The Unitarians include all the Poles, with some of the Magyars and Szeklers, and reside chiefly in the Szekler-land, where they have about 100 churches: they have a college at Klausenburg, and 2 gymnasia elsewhere.

"The habits of society in Transylvania, in many respects, differ little from those of England about the end of the last century. In some of the old-fashioned houses almost a patriarchal simplicity is kept up. The houses of the richer nobles are large and roomy, and their establishments are conducted on a scale of some splendour. It is true that they are deficient in many things which we should consider absolute necessities; but, on the other hand, they exhibit many luxuries which we should consider extravagant with twice their incomes. It is no uncommon thing, for instance, in a one-storied house, with a thatched roof and an uncarpeted floor, to be shown into a bedroom where all the washing apparatus and toilet is of solid silver. Bare whitewashed walls and rich Vienna furniture; a lady decked in jewels which might dazzle a court, and a handmaid without shoes and stockings; a carriage and four splendid horses, with a coachman whose skin peeps out between his waistcoat and inexpressibles,—are some of the anomalies still to be found in Transylvania." (*Ibid.* 318, &c.)

This principality had been connected with Hungary for many centuries previously to the conquest of that country by the Turks, after which it threw off its allegiance, and became a quasi indep. kingdom, alternately tributary to Turkey, or under the influence of Austria, to which latter empire it was annexed by Joseph II. in 1799. Since this period it has enjoyed comparative tranquillity. Of late years a vigorous opposition has grown up in the diet, and in 1834 government was obliged to recall the archduke Ferdinand, and to concede to the Transylvanians the election of the president of the diet, the free publication of debates, &c. (*Paget's Hungary and Transylvania*, 2 vols., the best work by far that has appeared on those countries; *Austrian Nat. Encyclop.*; *Berghaus*; *Marmont, Voy. en Hongrie*, &c., i. 105—132.)

TRAPANI (an. *Drepanum*, from *δρεπαινα*, a scythe, the tongue of land on which it is built being curved in the form of that instrument), a sea-port town of Sicily, cap. prov., dist. and cant. of same name, on a projecting point of land on the W. coast of the island, 46 m. W. Palermo, the light-house on Colombaria rock, at the mouth of the harbour, being in lat. 38° 2', N. long. 12° 30' 18" E. Pop., in 1831, 24,735. It is a military post of the second class, being surrounded by a wall and bastions, with ravines in good repair, and covered by a glacis. The harbour, on the S. side of the town, is protected by Sigia fort, at the extremity of the tongue of land on which the city is built, the fire of which is crossed by that of a battery on Colombaria rock. The castle, in the N. angle, though unworthy of the name, is the residence of the governor, and other military authorities. The streets are regular, and the town is commodious and pretty well built. The cathedral and senatorial palace are fine edifices. It has many convents and summeries, and nearly 40 churches, with 2 hospitals, a college, 2 seminaries, a well-conducted *monte-di-pieta*, and an oratorio. The church of San Lorenzo is said to be "a simple and majestic specimen of correct architecture." Despite the number of its priests and friars, its inhab. are said by Captain Smyth to be industrious and enterprising, and to afford the best artisans and sailors of the island. It has produced excellent scholars, painters, and architects, and the art of engraving on gems, which had been lost during the dark ages, was here recovered, and brought to perfection by Masarielli: indeed, the inhab. are now principally distinguished as sculptors and carvers of coral, amber, wood, shells, rings, and alabaster. To the W. of the town is a well-designed but still unfinished promenade. The marina forms a good walk under the line wall. The harbour is said to have been much damaged by the great earthquake of 1842; but though small it is secure, and might be easily enlarged. It has a tolerably good mole, on which is the

pratique office, accessible to vessels of 300 tons, vessels of larger burden anchoring near the Colombaria, in 8 or 9 fathoms water, muddy bottom. Water is conveyed to the town by an aqueduct from the foot of Mount San Giuliano (an. *Eryx*), a little to the N.E. of the town. See GIULIANO (SAN).

The trade of the town is very considerable. The *salinas*, a little to the S.E., are the most extensive of any in the island. The salt, which is of good quality, costs about 8s. a ton, and is largely exported. The Transylvanians carry on the coral fishery on the coast of Africa to a considerable extent; and the cutting and polishing of coral is one of the principal branches of industry carried on in the town. Besides salt and coral, the exports comprise soda, alabaster, rough or cut iron vases, statues, &c., and a variety of other articles. In 1839, the port was entered by 114 foreign vessels, of which 73 were Austrian, and only 2 English.

Excepting vestiges of the mole formed by Fabius to join Colombaria to the continent, 2 mutilated lions' heads, that grace a fountain, and some fragments of marble, there are no remains of antiquity here, though coins of Drepanum have been occasionally found. (*Smyth's Sicily*, p. 237, &c.; *Macgregor's Report on Sicily*, &c.)

Drepanum is very ancient. It is represented by Virgil as having been visited by Aeneas, and as the place where Anchises breathed his last. (*Æneid* iii. lin. 707.) It was early occupied by the Carthaginians, and from its advantageous position and excellent port, was considered by them as of the first importance. During their struggle with the Romans it was the scene of frequent contests. Of these the most celebrated was the great sea-fight, anno 237 B.C., between the Roman fleet under the consul Claudius Pulcher, and the Carthaginian fleet under Adherbal. The latter gained a complete and decisive victory, with comparatively little loss on their part. (*Polybius*, lib. i. cap. 4.)

TRAVANCORE, a state of Hindostan, subsidiary to the British, and forming the S. extremity of the Indian peninsula, between the 8th and 10th degs. of N. lat., and the 76th and 74th degs. of E. long., having E. the British districts, Tinnevely and Dindigul, N. Cochin, and on other sides the Indian Ocean. Length, N. to S., about 140 m.; breadth, 60 m. in the N., and gradually diminishing to 20 m. in the S. Area estimated at nearly 4,600 sq. m., and pop. at somewhat less than 1,000,000. The surface, which is varied with hill and dale, rises in the E. into a mountain chain, covered with forest trees and jungle. It is well watered, and highly adapted, by its climate, &c., to the wet cultivation, and rice is grown in large quantities: besides which, pepper, cardamoms, cassia, ginger, turmeric, betel nut and cocoa nuts, are among the chief vegetable products. Tobacco is principally imported from Ceylon, and is a government monopoly, from which the rajah is stated to derive a revenue of 13 lacs of rupees a year. (*Colebrooke in Revenue Rep.*) Elephants, buffaloes, and large tigers inhabit the more remote parts, and ivory, bees' wax, and some other valuable animal products are among the exports. Indications of coal are said to be met with.

According to Col. Munro (*Essays*, 1832), the whole of the land belongs to the government, or to individuals; village institutions being rare, or rather wholly wanting in Travancore. The land is assessed on the ryot-war system, a fresh survey having been made under the native government, every 10 or 12 years. Though the country is poor, the inhab. are said to be less impoverished than in many parts of the E. I. Company's territories, the land-tax being less heavy. Lands, the property of the government, are assessed according to the quantity of seed sown on them, and the rent, in general, amounts to less than half the produce: lands, the property of individuals, pay, in many cases, under 5 per cent. on the produce. The lowness of the land-tax was formerly compensated for, to the native government, by the monopolies of pepper, betel, cardamoms, and other valuable products, which the inhab. were obliged to supply to the state at very low prices. Most of these monopolies were destroyed, and replaced by a more equitable system of taxation, while the country was under the administration of the British. Except, however, as respects the lightness of the land-tax, the native government of Travancore was most oppressive. There was a chain of officers from the *devan* to the lowest inhab. exercising all the powers of government, military, judicial, civil, revenue, without any check or control whatever; and besides this, several of the subordinate classes, subject to a capitation-tax, were formed into companies of about 100 men each, under a separate officer, and obliged to perform all kinds of work for the benefit of the government at the pleasure of revenue servants. Under the British, this chain of revenue servants was abolished with the capitation-tax, and the various monopolies, except those of pepper and tobacco. At the same time, however, the land-tax was increased, a circumstance which in so far counterbalanced the other

improvements. In 1814, the country reverted to its former authorities, and since then, the old order of things is said to have been in a great measure revived.

Travancore, being an integral portion of the anc. Malabar, the prevailing usages and customs are generally similar to those which prevail along the adjacent parts of the W. coast of Hindostan. The sovereignty of the country, honorary dignities, and even property, descend in the female line, as in Canara, &c. The ruling family is Hindoo, and the principal part of the pop. consists of Brahmins and Nairs; but there are also many Moplas (Mohammedans), and it is estimated that, in Travancore and Cochín, there are 100,000 Syrian Christians. In some communities, Christian churches are considerably more numerous than pagodas or mosques. The Travancore rajah, about the middle of last century, subdued most of the smaller states in his neighbourhood, and extended his dom. to their present limits, but, in 1790, these would have fallen a prey to Tippono Salb but for our intervention. The final subsidiary treaty with the British was entered into in 1809. Travancore furnishes to the Anglo-Indian army a contingent of 3 battalions of infantry, and 8 lacs of rupees a year to the Indian treasury. Total revenue, in 1826-27, 40,42,645 rupees; expenditure, including subsidy, 37,68,392 rupees. Principal towns, Trivandrum, the cap., Anjengo and Quilon; Travancore, the former cap., is now in a state of decay. (*Parl. Reps.*, &c.)

TREBIZOND (an. *Trapczus*), a city and sea-port of Asia Minor, on the S.E. coast of the Black Sea, 120 m. N.W. Erzeroum; lat. 40° 1' N., long. 39° 44' 52" E. Pop. variously estimated at from 15,000 to 30,000. The town is built on the slope of a hill declining to the sea, and backed by steep eminences rising behind. Its central portion is surrounded by a castellated and lofty wall; on either side of the walled portion is a deep ravine, filled with trees and gardens, both ravines being crossed by bridges. Overlooking the town is a citadel; but it is dilapidated and neglected, and commanded by neighbouring heights. The walls of the city are, however, sufficiently strong to serve as a defence against troops without artillery. The space included within the walls is of great extent, but it is principally filled with gardens and plantations. The houses, which are mostly built of stone and lime, and roofed with red tiles, have in general only a ground-floor, and as each is environed by a garden, the town from the sea has the appearance of a forest, scarcely a house being visible. The walled city is solely inhabited by Mohammedans; the Christians live outside the walls (principally in the eastern suburb), where are also most of the bazars and khans. Besides nearly 20 churches and chapels, still retained for the service of the Greeks and Armenians, almost all the mosques have formerly been Christian churches. The handsomest mosque is that of St. Sophia, 1 m. W. of the city. "It is of small dimensions, built of hewn stone, in the form of a cross, and divided into a nave and 2 aisles, lighted from a cupola supported by 4 marble pillars. The principal entrance is adorned with 4 white marble Corinthian columns: the Roman eagle is conspicuous over the gate; below it are numbers of small reliefs, and a beautiful cornice runs round the exterior of the edifice." (*Kinnier's Asia Minor*, p. 337.) Several of the other mosques and churches are in the same style; but the most curious edifice in the city is the *deservin*, a huge square structure with two small windows in each front, probably erected by the Genoese as a powder-magazine. (*ib.* p. 341.) A high square tower and the massy remains of many other buildings crown the eminences near the mosque of St. Sophia; but none of these, nor any other remains at Trebizond, are of an age anterior to the Christian era, and Mr. Hamilton regards all the existing ruins, called Genoese by the Turks and Greeks, as clearly Byzantine. (*Geog. Journ.*, vii. 42.)

Trebizond has two ports; one on either side of a small peninsula projecting from the town into the sea. That on the E. is the best sheltered, and is the place of anchorage for the largest ships. It is exposed to all but S. gales; but it does not appear that with ordinary precaution any danger need be apprehended. The ground from  $\frac{1}{2}$  to  $\frac{1}{4}$  m. E. from the point is clean, and holds extremely well. Ships moor with open hawser to the N. and a good hawser and stream-anchor on shore as a stern-fast. At night the wind always comes off the land. After the autumnal equinox, the Turkish and European vessels resort to Platana, an open roadstead, about 7 m. to the W. of Trebizond. (*Com. Dict.*; *Brant*, in *Geog. Journ.*) In antiquity, and in more modern times previously to the conquest of Constantinople by the Turks and the exclusion of all foreign vessels from the Black Sea, Trebizond was the seat of an extensive trade. It is the natural emporium of all the countries to the S.E. of the Black Sea, from Kars on the E., round by Diarbekir to Amasia on the W. Previously to 1830, however, its trade had dwindled to the export of a few products of the country to Constantinople, the import of iron from Taganrog, and a traffic with Abassah, carried on in small craft, which

carried away salt, sulphur, lead, and Turkish manufactures; bringing in return the raw productions of the Caucasus, slaves, &c. But the treaty of Adrianople, by opening the Black Sea to European ships, restored the old channel of communication between Europe and India, Persia, &c. through Trebizond; and the Russian policy of 1831, by putting an end to the immunities enjoyed by the Russian ports S. of the Caucasus, has given Trebizond an importance it did not previously possess. Its principal articles of import are manufactured cottons, mostly from Great Britain, sugar, coffee, rum, salt, tin, wine, &c. More than half the articles imported are destined for Persia; and while, in 1830, only 5,000 bales of European merchandise passed through Trebizond on their way to that country, in 1835, nearly 20,000 proceeded by the same track to the same destination. (*Brant*.) The exports to Europe consist of silk, sheep's wool, tobacco, carpets, shawls, galls, and drugs of various sorts, box-wood, nuts, &c., with some wax, honey, and beans to Constantinople; but all in comparatively trifling quantities. Rich veins of copper and lead exist in the neighbouring mountains, but they are badly, if at all, wrought; but as the export of timber and corn is no longer prohibited by the Turks, it is not so difficult as formerly to obtain return cargoes.

This city was originally founded by a colony from Sinope, but subsequently outstripped its parent city, and all its sister ports along the coast, in wealth and importance. It was a flourishing emporium when it was reached by Xenophon, and the ten thousand at the close of their memorable retreat. It continued to be an important city of the Greek empire till the subjugation of the latter by the Crusaders; when its duke of the Comneni family assumed the dignity of emperor. His dominion extended from Sinope to the Phasis, and his family reigned for more than 260 years, till Trebizond came into the possession of the Turks in 1460. (*Smith and Dwight, Researches*, &c. 454-458; *Geog. Journal*, vi. vii.; *Kinnier's Asia Minor*; *Com. Dict.*, &c.)

TREGONY, a market town of England, co. Cornwall, hund. Powder, par. Cuby, on the Fal, 16 m. S.W. Bodmin. Area of the par. of Cuby, 2,410 acres. Pop. in 1831, 1,282. This insignificant place would not have been worth notice in a work of this kind, but for the circumstance of its having sent 2 mems. to the H. of C. from 1599 down to the passing of the Reform Act, when it was most properly disfranchised. The right of election was in potwallers residing within the bor. The pop. is almost exclusively agricultural.

TRENT (an. *Tridentum*), a town of the Tyrol, but within the natural limits of Italy, on the Adige, which is here crossed by a fine bridge, 14 m. N.N.E. Roveredo, lat. 46° 6' 26" N., long. 11° 3' 45" E. Pop. 13,000. It is seated in a small but beautiful valley; being, however, from its elevation, exceedingly cold in winter, and from the reflection of the surrounding mountains, equally hot in summer. It is surrounded by a pretty high wall, is well built with houses in the Italian style, has well-paved though irregular, narrow, and dirty streets, and a square ornamented with a handsome fountain. The palace belonging to the old prince-bishops of Trent, in a corrupt Gothic style, is of large dimensions, has some good apartments, fine fresco paintings, rare marbles, and extensive gardens. It has also a cathedral and several other churches; in one of which, Santa Maria Maggiore, the famous council held its meetings. In 1805, the roof of this church fell in, and we have not learned whether the original picture representing one of the sittings of the council, with portraits of its more distinguished members, that belonged to this church, escaped being destroyed. (*Rampoldi*, iii. 1245.) It has also three convents for monks, and a nunnery, a large hospital, an orphan asylum, a lyceum with several professors, a gymnasium, &c.; with manufactures of silk and other fabrics. It is one of the seats of the transit trade between Germany and Italy; and exports wine, corn, tobacco, and iron, produced in the surrounding country.

This town, which is very ancient, became, in the middle ages, the cap. of a lordship under its bishops, by whom, in 1363, it was united to the Tyrol, in which it has since been comprised. The bishopric was secularised in 1803; but the bishop is still in the enjoyment of a handsome revenue. Under the French it was the cap. of the dep. of the Upper Adige, and is now the seat of the government of the circle of the same name. (*Marcel de Serres, Voyage de Tyrol*, ii. 362; *Eustace*, i. 102, 8vo. ed., &c.)

But the celebrity of Trent is entirely owing to its having been selected as the place of meeting for the famous general council of the church, convoked by Pope Paul III., and which, after much procrastination, met for business on Dec. 13, 1545, and continued, though with several interruptions, through 25 sessions, till 1563, under three successive pontiffs. It consisted of dignitaries of the church, representatives of the different universities, and of ambassadors from the princes and states attached to the communion of Rome. It was intended to revise, fix, and declare the doctrines of the

church, to remove the abuses that had crept into its government, and the conduct of its functionaries, —

— successores lapsi  
Legibus, et versis revocare in pristina mores,

and, if possible, to restore peace and unity to the church. It may be said to have fully accomplished the first object, and, in some degree, also, the second; but, as might easily have been foreseen, it wholly failed in the third object, or in the attempt to smooth the differences and allay the violent struggles and animosities that then divided and agitated the Christian world. The constitution of the council, indeed, and the commanding influence which the papal legates early acquired over its deliberations, deprived it of all pretence to the character of an impartial tribunal, and fully justified the Protestants in repudiating its authority and rejecting its decrees. The latter were subscribed by 255 legates, cardinals, archbishops, bishops, and other dignitaries, and have been generally admitted to contain, along with the creed of Pope Pius IV., a complete, authoritative, and well-digested synopsis of the principles and doctrines of the R Catholic religion.

The intrigues of which this council was the theatre have been developed with singular talent by Sarpi, in his famous *History of the Council of Trent*. But as Sarpi was the implacable enemy of the court of Rome, and has dexterously endeavoured to show that its pretensions were almost always unfounded, and its advocates in the council almost always in the wrong, his conclusions, or, rather, the conclusions drawn by the reader from his statements, are not always to be depended on. The history of Sarpi, though an able and ingenious, cannot be said to be an honest or trustworthy work. Tiraboschi cautiously says of it, "Io son ben lungi di sostenere, che gli si debba credere ciò ch'ei racconta, solo perchè egli li racconta!" (Letteratura Italiana, viii. 131, ediz. Modena, 1793.)

TRENT, a river of England, being next to the Thames and Severn, by far the most important stream in that part of the U. Kingdom, not only on account of the length of its course, but of the fertile districts through which it passes, the immense number of canals with which it communicates, and the considerable rivers it receives in its progress.

It has its source near the Cheshire border, in the moorlands of Staffordshire, about 4 m. N. from Burslem. At first its course is nearly S.E., when it makes a sudden turn by the E. to the N. near Burton-on-Trent. It afterwards divides Leicestershire from Derbyshire; and pursuing a N.E. course, by Nottingham to Newark, it turns more and more to the N. After dividing Nottinghamshire and Lincolnshire, and passing Gainsborough, it enters Lincolnshire at West Stockwith; and flowing N., with a little inclination to the E., unites with the great estuary of the Humber, at a place called Trent-falls. It may be navigated by vessels of 200 tons as far as Gainsborough, and by barges as far as Burton-on-Trent, a distance of about 117 m., having in this lengthened course a fall to low-water mark of only 118 ft., or very near a foot per mile. From Burton-on-Trent to its source, the rise of the river is about 376 ft.; at least, the summit level of the Caldon Canal, which passes near the head of the Trent, is 494 ft. above the sea. (Priestley's *Map of Canada*, &c.)

Of the subsidiary streams that fall into the Trent, the most considerable are the Blythe, Tame, Dove, Derwent, and Soar; but of these it is only necessary to notice the last two. The Derwent rises in that part of Derbyshire called the High Peak; after passing Matlock, Cromford, and Derby, it has a circuitous course from the latter to Wilden Ferry, where it unites with the Trent. It is navigable as far as Derby about 13 m.; but it has been superseded, as a channel of communication, by the Derby canal. The Soar rises E. from Winckley, in Leicestershire, it flows through a rich grazing country, and more than half encompasses the ancient town of Leicester. After receiving the Wreke, its course is N., with a little inclination to the W.; passing Loughborough, it falls into the Trent near Cavendish Bridge. It is navigable to near Loughborough, a distance of about 7 m.

The canals that communicate with the Trent are of the greatest importance: assisted by them, it affords an easy means of export for the manufactures of a large district of Lancashire; the salt of Cheshire; the produce of the Potteries of Staffordshire; the coal of Derbyshire; and the agricultural products of Nottinghamshire, Leicestershire, and Lincolnshire. It also opens a communication with the sea by way of Lincoln and Boston; through which channels, as well as the Humber, the articles above enumerated are conveyed; and, in return, the interior of the country is supplied, either by Hull and Gainsborough, or Boston and Lincoln, with such commodities as are required by an immense population. (Priestley's *Treatise on Rivers, Canals*, &c. p. 681.)

TRENTON, a town or city of the U. States, state New Jersey, of which it is the cap., though not the

largest town, co. Hunterdon; on the Delaware, at the head of the sloop-navigable, 30 m. N.E. Philadelphia, lat. 40° 13' N., long. 75° 48' W. Pop., in 1840, 4,035. It is regularly laid out, and well built; the state house, prison, various churches, the bank, and several cotton factories, are among the most conspicuous buildings. The river is here crossed, immediately below the falls, by a covered wooden bridge, 1,000 ft. in length. The Delaware and Raritan canal passes through the town; and Trenton communicates with New Brunswick by a railway 27 m. in length. (*American Almanac*, 1841.) It is famous in the history of the American revolution for the victory gained over the British and Hessians, Dec. 26, 1776, by the troops under Washington, whose decision and intrepidity on the occasion materially promoted the progress of the Revolution. (*Encyc. Geog.*, Amer. edit.; *Stuart's America*, i. 382.)

TREVES (Ger. *Trier*), a city of the Prussian dom., prov. Rhine, cap. of a reg. of the same name, on the Moselle, near its confluence with the Saar, and near the frontier of Luxembourg, 60 m. S. W. Coblenz, lat. 49° 46' 37" N., long. 6° 38' 20" E. Pop. in 1838, 14,941. Streets broad and straight; and some of the public buildings are imposing. Among the latter may be specified the cathedral, remarkable for its altars and marble gallery; the church of St. Simeon, of great antiquity; the elector's palace, now turned into barracks; the bridge over the Moselle, 600 ft. in length, the piers of which are supposed to have been built in the 28th year of the Christian era; the gate of Mars (*Porta Martia*), of colossal dimensions and great antiquity, &c. Its ancient university was suppressed in 1794, but it has a college or seminary for the education of Catholic clergymen, a gymnasium, a collection of medals, and a public library, both of which belonged to the university; the latter comprises above 80,000 vols., many of which are scarce and valuable; it has also several hospitals, and a theatre. It is the seat of the government, has a prov. council, a tribunal of appeal for the prov., a tribunal of commerce, &c., with manufactures of linen, woollen, and cotton stuffs. Boats for the navigation of the Rhine are built here; and it has a considerable trade in Moselle wine, &c.

Treves is, perhaps, the most ancient, and was long the most celebrated, of the German cities. A Roman colony was planted in it during the reign of Augustus; and thence it was called *Augusta Treverorum*. From that period it became a place of great importance, and was reckoned one of the bulwarks of the empire on the side of Germany. Constantine the Great and several other emperors occasionally resided in Treves. Ammianus Marcellinus calls it *Domicilium principum clarum* (lib. 15. s. 27.) Ausonius, in his poem *De Claris Urbibus*, celebrates its praises, and notices the extensive commerce carried on by the Moselle. Besides the bridge, the *Porta Martia*, &c., other remains of buildings that still exist, and many coins and relics found in the town and its vicinity, attest the power and splendour of its Roman masters. Beyond its walls are the ruins of an amphitheatre, cut in the side of a hill, where Constantine is said to have exposed some thousand Gauls to be torn by wild beasts. Treves was successively laid waste by the Huns, Goths, Vandals, and Franks, and as often rebuilt. It was for a lengthened period the cap. of the archbishopric or electorate of Cleves. Latterly the pop. has increased considerably; though there is little probability that it will ever recover its ancient fame and importance. (*Cellarii, Notit. Orbis Antiqui*, i. 317.; *Schreiber*, &c.)

TREVISIO (an. *Trevistum*), a town of Austrian Italy, prov. Venice, cap. deleg. of its own name; on the Sile, 16 m. N. by W. Venice. Pop. in 1837, 11,558. It is irregularly built, and is surrounded by old walls. Most of the streets are wide and well paved, with colonnades in front of the houses; and there are numerous *palazzi* and religious structures. The old cathedral of St. Peter, a fine though unfinished structure, has in it a painting by Titian, and others by P. Bordone (a native of Trevisio), Domenichino, &c. The Gothic church of S. Nicolo, the town house, and theatre, are good buildings; and in the *monte di pietà* is a fine picture by Giorgione. Trevisio is a bishop's see, and has an episcopal seminary, gymnasium, public library, botanic garden, several hospitals, a castle, theatre, &c. The university, afterwards removed to Padua, was first established here. A large hardware factory, an extensive pottery, and manufactory of silk twist and stuffs, woollen cloths, paper, and cutlery, with some trade in corn, wine, cattle, fruit, &c., occupy most part of the inhabs. A large fair is held each year, from the 3d to the 18th of October. This town appears to have been a Roman *municipium*. Under the Lombards, it was the cap. of one of the two marches or margraviates which they established on the confines of their kingdom in Italy (Ancona having been the cap. of the other). Under the French, it was the cap. of the dep. Tagliamento. Napoleon conferred the title of Duke of Trevisio on Marshal Mortier. (*Ranpoldi; Austr. Nat. Encyc.*)

TREVOUX (an. *Trivula*, or *Trivium*), a town of

France, dep. Ain, cap. arrond. on the declivity of a hill, on the Saône, 13 m. N. Lyons. Pop. in 1836, 2,325. It was formerly surrounded by walls and towers; and, on the summit of the hill on which it is built, are the ruins of its old castle, commanding a most extensive view over the surrounding plain. It has an antiquated appearance, with narrow streets, and mean-looking houses. Having been formerly the cap. of the principality of Dombes, and the seat of a parliament, courts of justice, a mint, &c., it has still to boast of some considerable ancient edifices, including the hall in which the parliament meet, the hall of the courts of justice, an hospital founded by Anne Marie Louise D'Orleans, a quay on the Saône, &c. It has, also, a tribunal of original jurisdiction; a cloth manufactory; a royal establishment for the refining and assay of gold and silver; and some trade in the products of the surrounding country. It is very ancient. The emperor Severus defeated, anno 197, his competitor Albinus under its walls.

Trevoux has attained to considerable distinction in literary history. Louis Auguste de Bourbon, prince of Dombes, endeavoured to make it a sort of literary capital, and, in this view, he established, in 1695, a considerable printing-office in the town, in which he also intended to found a college. And not long after, or, in 1701, the well known and very learned monthly publication, entitled the *Journal de Trevoux*, conducted by the Jesuits, began to issue from this press; where it continued to be printed till 1771, when it was transferred to Paris. Here, also, appeared, in 1704, the first edition of the *Dictionnaire de Trevoux*, in 3 vols. folio. There were several subsequent editions of this valuable work, most of which, however, were printed and published in Paris. Of these the last and best edition, in 1771, was so much enlarged as to comprise 8 vols. folio. (*Hugo*, art. *Ain*; *Moreri*, art. *Trevoux*.)

TRICALA or TRIKHALI (an. *Tricea*), a town of European Turkey, cap. of the prov. of same name, identical with the an. Thessaly, on the E. side of a mountain ridge, 2 m. N. from the Selymbria (an. *Penens*), and 37 m. W. by S. Larissa. Pop. estimated at from 10,000 to 12,000, chiefly Turks. It is of considerable extent; and the houses being intermixed with gardens and trees, it appears to be built in a wood, and the lofty minarets of its mosques rising above the trees give it a picturesque appearance. It has several Greek churches and synagogues. At the height of 10 or 12 ft. above the pavement a wooden trellis-work interwoven with vines is carried over the streets, completely shading the passengers below. The shops are clean, and tolerably well furnished, and their possessors, who are chiefly Greeks or Jews, have a respectable appearance. (*Holland's Trav* p. 249.) According to Strabo, this city had a magnificent temple of Esculapius; but no traces of this edifice are now known to be extant. On a hill above the town are the ruins of a castle apparently dating from the time of the Greek emperors, and commanding a fine view over the plains of Thessaly. These are depastured by numerous flocks of sheep, and also produce a good deal of cotton, the manufacture of blankets, coarse woollens, and cotton stuffs, occupying many of the inhabitants of Tricala. Its trade is also pretty extensive, from its being on the principal road from Yanina to Constantinople, and commanding the only pass by which supplies of corn and other provisions are brought from Thessaly into Albania. The latter circumstance renders it important as a military post. (*Hughes, Trav. in Albania*, &c. i. 130; *Cramer's Anc. Greece*.)

TRICHINOPOLY, a distr. of British India, presid. Madras, chiefly between lat. 10° 30' and 11° 30' N., and long. 78° 10' and 79° 30' E., having N. Salem and S. Arcot, E. Tanjore, S. the latter and Madura, and W. Salem and Coimbatore. Area, 3,169 sq. m. Pop. in 1836-7, 854,730. The Cavery runs from W. to E. through the country, irrigating a considerable extent of rice land. In addition, to rice, sugar-cane, with tobacco and betel-leaf, are grown in the tracts watered by tanks and wells; in the dry lands the other usual products of the Carnatic are extensively cultivated, and there is good pasturage for sheep and cattle, which are numerous. The principal imports are gins, oil, tobacco, pepper, and areca nut; while the exports comprise cloth, indigo, saltpetre, and cotton. The principal manufactures are cloth, for domestic use, and indigo, with some subsidiary articles made in the town of Trichinopoly (which see). Total land revenue, in 1836-7, 1,428,855 rupees.

TRICHINOPOLY, a large fortified town of British India, presid. Madras, cap. of the above distr., on the Cavery, 180 m. S.W. Madras. Pop. exclusive of troops, estimated at 74,000. (*Madras Almanac*.) It is of an oblong form, nearly 1 m. in length, N. to S., by about  $\frac{1}{2}$  m. in breadth. Exclusive of some outworks, it is surrounded by a double wall and ditch, with a covert way and glacis. But its defences are now mostly in a ruinous state, except the citadel near its N. extremity, which, being situated on an elevated rock, commands any military operations carried on in any part of the vicinity. On

this rock also stands a large and massive pagoda, and a pillared square building, with a statue of Hanuman, occupies the highest peak, while in the S. face of the rock is a small sculptured excavation in the style of some of the cave temples at Ellora. The jewellery made at Trichinopoly had formerly much celebrity; and Trichinopoly chains are still in request. Cotton cloths, table linen, harness, &c., are made here; and the town is an emporium for a great variety of manufactures. It is well adapted for a military station, as, besides being well supplied with different kinds of merchandise and artisans, the roads about it are so good as to admit, at every season, of an easy communication with Madras, Vellore, and Mysore. Hence, also, diverge all the great roads leading to Tanjore, Madura, and Dindigul, the three chief stations in the S. part of India. (*Madras Almanac*, &c.)

TRIESTE (an. *Tergeste*), a town and principal seaport of the Austrian empire, cap. gov. and circ. of its own name, prov. Illyria, on the Adriatic, near its N.E. extremity, 73 m. E. by N. Venice. Lat. 45° 34' 37" N., long. 13° 46' 27" E. Pop. in 1836, of the city only, 51,346. The pop. of the town and its district, comprising about 40 sq. m., amounted, in 1839, to 75,551, having increased to that amount from 45,323 in 1821 (*Bouring's Rep*; *Berghaus*.) Trieste is divided into the old town, the new town, or Theresienstadt, the Josephstadt, and the Frauenzovenstadt (Francis's suburb); the old town stands at the foot and on the declivity of a steep hill crowned by the citadel; it has dark, narrow, winding, and frequently steep streets, with gloomy-looking houses, and is surrounded by the remains of ancient fortifications. The new town, immediately N.W. of the former, and built on level ground, partly taken from the sea, consists, on the contrary, of handsome streets, crossing each other at right angles, and lined with neat buildings. It is partially intersected by the canal cut by Maria Theresa, by means of which vessels drawing 9 or 10 ft. water may load and unload at the doors of the warehouses. Between the new and old towns runs the *Corso*, the principal thoroughfare, broad but winding, furnished with good shops and coffee-houses, and opening successively into spacious and handsome squares. The principal of these is the *Piazza-Grande*, with a large public fountain, the column, and statue of the Emperor Charles V., to whom Trieste is principally indebted for its importance in modern times. In this square the great vegetable and fruit market is held, and on one side of it is the *locanda-grande*, or principal hotel, commanding a fine view of the harbour. The exchange, the finest building in the city, stands in another square, in which is a statue of Leopold I. Continual improvements appear to be taking place in and around Trieste; many new streets and promenades have been laid out, and public walks planted with trees; new moles, and a gigantic hospital, the cost of erecting which has been estimated at 800,000 florins, have very recently been constructed.

The cathedral, in the old town, is supposed to occupy the site of a temple of Jupiter. It is in the Byzantine style; its interior, like St. Mark's at Venice, is ornamented with mosaics, and many Roman inscriptions, carvings, &c., are built up in the walls. It contains the monument of Winkelmann the antiquary, author of the famous work, *Histoire de l'Art chez l'Antiquité*, assassinated here in 1768. There are 5 other Rom. Catholic, 2 Protestant, and 2 Greek churches, a synagogue, and an English chapel. The finest of these edifices are the Greek churches, particularly that at the head of the great canal, with a magnificent marble altar, and an organ esteemed among the best in Italy. The church of the Jesuits merits attention by its architecture and fine paintings, and the palace of the governor is also an imposing structure: the handsomest residence is the house formerly belonging to a Greek merchant in the name of Caracciotti, who, having begun business in Trieste almost as a pedlar, said to have died worth 1,000,000 sterling! (*Spencer*.) The castle formerly constituted the main protection of the town and harbour, and is still maintained in a tolerable state of defence. The great theatre is spacious, and there are several minor theatres. Among other objects worthy of notice are the barracks, post-house, dockyard, lazaretto, one of which is among the most perfect establishments of its kind, and the terrace of the casino ornamented with several statues.

Trieste is in the S. what Hamburg is in the N., the great commercial entrepôt of Germany. A harbour, which, though rather limited in size, is easy of access and convenient, has been formed by the Theresian Mole, founded on a ledge of sunken rock, and projecting N.W. into the sea from the S. extremity of the old town. At its termination has been formed an irregular platform about 1,100 ft. in circ., on which have been erected a fortress and light-house, with an intermittent light 106 ft. above the sea. Another light-house, having the lantern 103 ft. above the sea, has been erected on the point of Salvore, about 18 m. W. by S. Trieste. The

port, with the Mole, forms a crescent 14 m. in length, being a continued quay, faced with hewn stones, and with stairs and jetties for the convenience of embarkation. On the N. side of the port is the dock or harbour, appropriated exclusively for vessels performing quarantine. It is walled round, and furnished with hotels, warehouses, and every sort of accommodation for passengers and goods. Ships under 300 tons burden lie close to the quays; those of greater size mooring in the roads in front of the city. The principal defects of the port are its limited size, and its being exposed to N.W. winds, which sometimes throw in a heavy sea. The gales, however, are seldom of long continuance; and the holding ground being good, when proper precautions are taken, no accident occurs.

Trieste being a free port, goods destined for its consumption, and that of the adjoining territory, pay no duties; but such as are taken into the interior for consumption pay, of course, the duties in the Austrian tariff. The transit duties and shipping charges are extremely reasonable.

The exports are very various, consisting partly of the raw and partly of the manufactured products of Austria Proper, Illyria, Dalmatia, Hungary, and Italy; with foreign articles imported and warehoused. Among the principal articles of raw produce may be specified, corn, chiefly wheat and maize, with rice, wine, oil, shumac, tobacco, wax, &c.; silk, silk rags and waste, hemp, wool, flax, linen rags, hides, furs, skins, &c.; the produce of the mines makes an important item, consisting of quicksilver, cinnabar, iron, lead, copper, brass, litharge, alum, vitriol, &c.; the forests of Carniola furnish timber, for ship-building and other purposes, of excellent quality, and in great abundance, with staves, cork wood, box, hoops, &c.; marble also ranks under this head. Of manufactured articles, the most important are, thrown silk, silk stuffs, printed cottons from Austria and Switzerland, coarse and fine linens, and all sorts of leather; under this head are also ranked soap, Venetian treacle, liqueurs, &c., with jewellery, tools and utensils of all sorts, glass ware and mirrors, Venetian beads, refined sugar, and a host of other articles. Trieste is also a considerable *dépôt* for all sorts of produce from the Black Sea, Turkey, and Egypt.

The principal articles of importation consist of sugar, coffee, dye-stuffs, cotton goods and cotton yarn, silks, oil, tin plates, salted fish, and a host of other articles. The value of the imports always exceeds that of the exports, occasioned in part by their being subsequently transhipped to other ports, and partly by there being an excess of exports as compared with imports from other parts of the empire. We subjoin

An Account of the Quantities of the principal Articles of Foreign Raw Produce imported into Trieste during each of the three years ending with 1840.

## TRINCOMALEE.

Trieste is the seat of the administration for its gov. and the Illyrian coast, of courts for the town and circle, a tribunal of commerce, the central board of health for the empire, and a board of police, &c., and is a bishop's see. It has an imperial academy, a school of navigation, normal, female, Jewish, Greek, and elementary schools, many charitable institutions and learned societies, and several periodical publications. There are no public banks, but several private establishments of undoubted solidity, and various insurance offices. Trieste has manufactures of rosoglio, wax, lights, leather, soap, playing cards, musical instruments, &c., with dyeing-houses, sugar refineries, potteries, and distilleries. It communicates by *digresse* three times a week with Vienna; and by steam packets once a month with Smyrna and Constantinople, and continually with Venice and other towns on the Adriatic. It is better supplied with provisions than might have been expected from the sterility of its environs; they are supplied chiefly from Dalmatia and the country round Venice. But notwithstanding the cheapness of most articles, owing to the absence of duties, Trieste is not a desirable residence for persons not engaged in business. Water is scarce and bad; the climate is in extremes; and the E. N.W. wind, known by the name of *Bora*, is very piercing. A mixture of all nations is met with here, and all the principal merchants and traders are foreigners. German is spoken by the authorities and in the public offices, but Italian is the prevailing language of the middle classes, while the lower speak a Slavonic dialect.

Traces of an amphitheatre and other Roman remains exist at Trieste. During the middle ages it was the cap. of a small republic; but its history presents little remarkable till 1719, when Charles VI. made it a free port. The French took it in 1797, and again under Massena in 1805. (*Austr. Nat. Encyc.*; *Berghaus*; *Bouring's Report on the Lombardo-Venet. States*; *Turnbull's Austria*, i. 361—382; *Spencer's Germany*; *Commercial Dict.* &c.)

TRIM, an inland town of Ireland, prov. Lonsater, co. Meath, of which it is the cap., on the Boyne, here crossed by a bridge, 25 m. N.W. by W. Dublin. Pop. in 1831, 3,282. This is a very old town, having been given by Henry II., as part of the palatinate of Meath, to Hugh De Lacy. The latter constructed the castle, which, from its extent, strength, and elevated situation on the banks of the river, was at once the largest and most important of the numerous fortifications erected by the English within the limits of the Pale. The ruins sufficiently attest its ancient grandeur. On the other side of the river are the ruins of St. Mary's Abbey, an ancient and extensive edifice; and there are some other ecclesiastical remains. The town had, also, been surrounded by walls, considerable portions of which are still entire. Indeed it was anciently the occasional seat of the lord-lieutenant; and several parliaments have been held within its walls. It was taken, without opposition, by Cromwell, in 1649.

At present, however, notwithstanding it is the co. town, Trim is of little importance. Its principal public building is the new co. gaol, an extensive structure on the radiating plan. It has also, an ancient par. church, a Rom. Cath. chapel, a dispensary, an infantry barracks, with a co. infirmary, schools, &c. It returned 2 mems. to the Irish H. of C. till the Union, when it was disfranchised, and since then it has continued to decline. The assizes for the co. are held here, and general sessions twice a year, and petty sessions on alternate Saturdays. It is a constabulary station, and has a flour-mill, a brewery, and a tannery. Markets on Saturdays; fairs March 27, May 8, Wednesday after Trinity Sunday, Oct. 1, and Nov. 16. Post-office revenue in 1830, 3844; in 1836, 5774.

About 3 m. S. from the town, on the road leading to Summerhill, is Dangan, formerly the property of the Earl of Mornington, and memorable as the birth-place of the Duke of Wellington. The house in which the great general first saw the light has, however, been wholly pulled down; but a handsome pillar, surmounted by a statue of his Grace, has been erected in the town, in commemoration of his achievements, and of his connection with the vicinity.

TRINCOMALEE, a marit. town of Ceylon, on its N.E. coast, near the entrance to one of the finest bays in the world, about 150 m. N.E. Colombo, lat. 8° 32' N., long. 81° 87' E. The town, which is but inconsiderable, is built at the foot of a rock, on which is the fort, on the outside of a narrow peninsula or tongue of land bounding the harbour on the E. It has but few European inhabs., and what is remarkable, few Singalese; the lower classes being principally Malabar M. Catholics. The fortifications form a sweep of above 1 m. in length along the shore. Fort Frederick is a station for four companies of a European regiment, a company of royal engineers and artillery, and detachments of the Ceylon ride corps. Fort Osterberg, on the termination of a ridge of hills, about 3 m. S.W. Trincomalee, commands

the entrance of the harbour, and the dockyard close beneath. It forms the head quarters of a detachment of artillery and a European company. The fortifications here were mostly constructed by the Portuguese: the Dutch did little or nothing for the improvement of the place while in their possession.

The harbour of Princemaele was styled by Nelson "the finest harbour in the world." It is almost land-locked, and the water is so deep that it is all but practicable in many places to step from the shore on board large vessels moored alongside. During the N.E. monsoon, when all the ships on the Coromandel coast and in the Bay of Bengal are obliged to put to sea, Trincomalee is their principal place of refuge, and a vessel from Madras can reach it in two days. The town, which may be considered as the military cap. of Ceylon, surrendered to the English in 1795. (*Hamilton; Modern Trav.*, &c.)

TRING, a market town and par. of England, co. Hertford, hund. Dacorum, on the London and Birmingham railway, and on the road from London to Aylesbury, 30 m. N.W. of London, and 7,300 acres. Pop. in 1891, 8,488. The town consists principally of two streets; it is tolerably well built, the houses being mostly modern. The church is an embattled structure, with a massive tower and low spire at the W. end. The living, a perpetuity, worth 157l. a year, is in the gift of the dean and chapter of Oxford. There are meeting-houses for Baptists and Independents, a Lancastrian school, &c. The inhabs. are principally employed in the manufacture of straw plait, canvas, and a few silk fabrics. Markets on Fridays; fairs, Easter Monday, and Oct. 11. The railway here attains a height of 420 feet above the level of the sea, being its highest or summit level. Tring park, in the vicinity, was built in the reign of Charles II.

TRINIDAD, an island of the W. Ind. arch. At Pailles, being the most southerly of the group called the Windward Islands, and next to Jamaica, the largest and most valuable of the islands belonging to Great Britain in this part of the world. It lies immediately off the N.E. coast of Colombia and the N. mouths of the Orinoco, between the 10th and 11th degs. of N. lat. and the 61st and 62d of W. long., its N.W. extremity being only about 13 m. from Punta de la Pena, the extremity of the peninsula of Paria; and its S.W. cape being but 7 m. from the Delta of the Orinoco. On the W. Trinidad bounds the Gulph of Paria, and on all other sides it is surrounded by the Atlantic. It is of a square or oblong form, with considerable projections at all its angles except the S.E. Length, N. to S., 50 m.; average breadth, (exclusive of its projections), about 33 m. Area estimated, by the best authorities, at 1,287,680 acres, or about 2,000 sq. m., though it has also been estimated at above 1,500,000 acres. Resident pop., in 1838, 39,328, of whom 3,601 were whites; but there are doubts as to the correctness of this return. The mountain chains run from W. to E., and may be regarded as continuations of the chains on the opposite coast of Venezuela, from which this island has most probably been detached by some convulsion of nature. Along the N. shore a bold range of mountains rises to the height of 3,000 ft., broken into the most rugged and abrupt forms, and clothed to the summit with forest trees. Towards the S. extends a chain of hills of less elevation, and of a more pastoral character, while the centre of the island is occupied by a group of flat or round-topped hills, dividing it, as it were, into two extensive valleys, which are occasionally intersected by a succession of hill and dale. The whole island is well watered by numerous streams in every direction. The principal are on the W. coast: the Caroni, navigable for 6 leagues from its mouth; and on the E. the Oropuche and Nariva, which last is said to be navigable for vessels of 250 tons to a league from its source. The N. and E. coasts are not well furnished with harbours; which is unfortunate, as the winds blow from those quarters for three fourths of the year. But the W. coast has numerous bays and inlets; and the Gulph of Paria is an extensive inland sea, in which ships of all sizes may ride securely, and anchor any where without the smallest risk, and in any convenient depth of water. (*Bust's American Coast Pilot*, p. 425.)

The greater part of the interior of this island is uncultivated, and, indeed, in a considerable degree unexplored. The low grounds are in parts marshy, while the more elevated portions are, for the most part, covered with a dense vegetation of forest and underwood. The accounts best entitled to credit represent the island as being naturally extremely fertile. The soil is, in general, deep, stiff, and tenacious; and it is said that, if properly cultivated, it could alone supply sugar adequate for the consumption of England. It might be supposed that, in an island so extensive, mountainous, and covered with forests, the atmosphere would be generally overloaded with moisture. It does not, however, appear that the fall of rain is as great as in Guiana, the average being about 65 in. a year; and this is said to diminish with the progress of cultivation. The dry season com-

mences in Dec., and ends in May; but it is a peculiar advantage of this island that it is exempted from those destructive droughts common to all the other W. India islands from Barbadoes to Cuba. During June and July showers are frequent; and in Aug., Sept., and Oct., the rain falls in torrents, often accompanied by violent storms. The weather generally moderates, and the rains become more slight towards the end of Oct., and there is seldom any fall after the beginning of Dec. The nights are generally cool and pleasant. The mortality during the twenty years ending with 1836, averaged about 10 per cent. of the white, and 4 per cent. of the black troops a year. Fevers and dysenteries cut off most of the whites. (*Papers relating to the W. Indies*, 1841-2, *Trinidad; Tullio's Rep. on the Health of the Troops in the W. Indies*, p. 17-19.)

It has been estimated that only about 1-30th part of the surface of this island is incapable of cultivation. The settled portions of Trinidad are mostly confined to the N.W. and a few places along the S.W. coast. It is stated in a Report by a sub-committee of the planters of Trinidad, that, in 1838, 208,379 acres of land had been appropriated, of which 43,265 were in cultivation, and that 1,079,301, were then unappropriated, and belonged to the crown. (*Papers relating to W. Indies, Trinidad*, p. 103.) Of the cultivated land, 21,710 acres were said to be under the sugar cane, being divided into 184 estates, the capital invested in which is estimated in the same document at 2,000,000l. sterling. The rest of the cultivated lands were occupied by cocoa plantations (6,910 acres), coffee do. (1,095), and provision and pasture grounds.

It is stated in the Report now referred to, and the same thing has since been repeated in a tract published by Mr. Burnley, that there is in Trinidad an extreme disproportion between the extent of granted land and fixed capital in the island, and the amount of the labouring population, and that the deficiency of the latter enables the labourers to dictate the terms of contract and the rate of wages, to the grievous injury not only of the capitalists but also of the labourers themselves. Some liberated Africans from Sierra Leone have been imported into Trinidad in the view of lessening the evil, but the supply has been too limited to have had much effect; and the committee propose, as the only effectual means by which it can be obviated, that leave should be given to import free labourers from Africa into the colony. We apprehend, however, that it would be extremely difficult, or rather, perhaps, we should say, impossible, to prevent this license from being abused; and considering the efforts we have made to prevent similar practices on the part of others, (*Benedicti on the Slave Trade*, p. 237,) it is not easy to see how we could sanction them in our own case. There is great reason to fear that the license in question would reproduce a considerable number, if not most of the evils connected with the slave-trade, and it is not, therefore, very likely that the power will be conceded.

The truth is, that the mischiefs complained of are not so much the effect of any positive scarcity in the supply of labour as of the circumstances under which the labourers are placed. They can provide for the comparatively few wants incident to such a climate with but little exertion, and having done this, it is to be expected they should do more? It is idle to suppose that blacks in the W. Indies, now that they are free, will make the same exertions they were compelled to make when they were slaves. The free inhabitants of all fertile tropical countries are, we believe without a single exception, uniformly indolent. And to suppose it should be otherwise is equivalent to supposing there may be an exertion without a motive, an effect without cause. If an hour's labour a day will fully supply a man's wants, it is absurd to suppose he should continue to labour three or four hours.

Cocoa is more extensively grown in Trinidad than in any of the other British Antilles, and is of superior quality. The cocoa-tree somewhat resembles the cherry-tree, and grows to about 15 ft. in height. It flourishes most in the new soil on the bank of a river, or in the shade, to procure which plantain or coral-bean trees (*quadrifid canero*) are planted between every other row. The cocoa seeds are placed in small mounds, two seeds being sown together; and the weakest plant of the two afterwards destroyed: the survivor is transplanted after attaining 15 or 18 inches in height. Until the age of 5 years, all the flowers are destroyed as they appear. The fruit grows in a pod, which, as it ripens, changes to a bluish red or lemon colour. The crop is gathered throughout the year, but principally in June and Dec. The ripe pods are broken or cut open, and the seeds extracted with a wooden spatula. They are afterwards spread out to dry in the sun on rush mats. When quite dry and hard, the nuts are lightly packed in boxes or bags, and kept dry for exportation. Coffee, indigo, tobacco, and cotton, come to perfection, though mostly grown only in small quantities. Here, also, are all the fruits and vegetables of the adjacent tro-

pleat climates, and the vines transplanted from France or Spain, are said to equal their parent stocks. The mountains, like those of the adjacent continent, consist chiefly of argillaceous and micaceous schist; milky quartz, ferruginous sand, pyrites, arsenic, alum, sulph. copper, plumbago, sulphur, &c. are found; but the most abundant mineral is asphaltum, which may be supplied in any quantity. It is found in the greatest profusion in the lake Brea, or pitch lake; an area of about 150 acres in the N.W. side of the island, about 30 m. S. from Port Spain, and about 80 ft. above the level of the sea. Though called a lake or lagoon, this depôt of pitch is for the most part quite solid, rent, however, by chasms, varying from 3 to 30 feet in width, but of no great depth, so that they are traversed without much difficulty. Here and there, wherever there is any soil, are clumps of stunted trees. The liquid part of the lake, on the side nearest the sea, is supposed to be about 3 acres in extent, and consists of fluid pitch of unknown depth, in a state of slow ebullition, and exhaling a strong bituminous and sulphurous odour. This vast pitchy cauldron must

be approached with extreme caution. It has been attempted to apply the asphaltum brought from this lagoon to the same purposes as pitch and tar, but it is found to require so large an admixture of oil that it becomes too expensive. If it could be economically applied, Trinidad might furnish abundant supplies for the whole world. (*Trinidad Almanac* for 1840, App. c. 4.)

Exclusive of the pitch lake, Trinidad has several extinct volcanic craters, active mud volcanoes, and other evidences of volcanic agency. Slight shocks of earthquakes have also been occasionally felt, but happily the island appears to be exempted from the scourge of hurricanes.

Trinidad was greatly neglected by the Spaniards, and previously to 1783, when emigration to it was first actively promoted by them, no more cocoa, indigo, and other products were exported than sufficed to freight a small schooner two or three times a year to St. Eustatius. Since then the progress of cultivation has been comparatively rapid. We subjoin an

ACCOUNT of the Quantity and Value of the principal Articles exported from Trinidad in 1829.

Trinidad, like St. Lucia and British Guiana, is governed by a governor and council, acting under the orders of the home government. The legislative council of the island consists of 12 members, 6 of whom are styled official, holding high offices, and 6 non-official, being selected from among the inhabs.; all are removable at the pleasure of the crown. The laws of the island are a mixture of those of Spain and England, and it is said that much mischief has been occasioned from the circumstance of the judges and other functionaries sent from England being ignorant of the former. The office of coroner does not exist here, nor trial by jury in the supreme criminal court. Every person about to leave the island, must first give public notice of his intention, and obtain a pass from the governor.

The settled part of Trinidad is divided into 11 districts. The cap. and seat of government, Port Spain, which in 1839 had 11,693 inhabs., is situated on the W. coast of the island, near the mouth of the river Caroni. It is one of the handsomest towns in the West Indies, being built wholly of stone or brick, with wide and well kept streets, some of which are shaded with rows of noble trees. It has Protestant and Roman Catholic churches, a Presbyterian secession church, and a Methodist chapel. The stores and magazines are crowded with valuable merchandise, which, however, is partly destined for the supply of Colombia. In the vicinity of the town are Fort George, now nearly dismantled, and St. James' barracks. The latter are said, in the *Trinidad Almanac*, "to be placed, on account of an infamous plot, in one of the most pestilential spots in the island." (p. 93.) The harbour is good, and, in fact, as already stated, the entire gulph of Paria may be regarded as a magnificent harbour. Numerous government and other schools are established in Trinidad, which in 1839 were attended by about 550 pupils. The regular military force amounts to about 3,400 men, including officers, but every freeman of the island is enrolled in the militia. Public revenue in 1835, 42,430*l.*; expenditure paid by the island, 38,757*l.*

Trinidad was discovered by Columbus in 1498, and was taken possession of by the Spaniards in 1584, an event followed by the almost total extermination of the Indians. Raleigh visited it in 1595. The French took it in 1696, but soon afterwards restored it to the Spaniards, who held it till taken by the English under Abercrombie in 1797. (*Trinidad Almanac* for 1840; *Parl. Papers*.)

TRIPOLI, the most easterly of the Barbary states, the dominions of which, exclusive of Tripoli proper, comprise Barca and Fezzan, noticed in other parts of this work. Tripoli Proper lies between lat. 29° and 33° N., and long. 10° and 20° E.; having E. Barca, W. Tunis, S. Fezzan and the desert, and N. the Mediterranean. It stretches along the North African coast about 800 m. E. and W. Its breadth inland varies greatly, owing to the frequent interruption of the desert; but its area has been estimated at nearly 100,000 sq. m., and its pop. at from 14 to 2 millions, principally Moors and Berbers, with some Turks, Negroes, Jews, and Christians.

In antiquity, Tripoli proper was called the *Regio Syrtica*, from its lying between the *Syrtis Major*, now the gulph of Sidra, on the E., and the *Syrtis Minor*, now the gulph of Gabes, on the W. The former, or *Syrtis*

*Major*, is a very extensive bay, extending from Bengazy on the E. to Cape Mesurata on the W. about 280 m., having where greatest a breadth of 150 m. This gulph was reckoned in antiquity, next to the strait of Scylla and Charybdis, by far the most dangerous part of the Mediterranean, principally on account of the shallowness of its waters, which were said to be encumbered with quicksands, and partly also from the irregular action of its tides. "*Verrum importunos atque atrox, et ob vadiorum frequentium brevia, magisque etiam ob alternos motus pelagi adjacentis et refluxus infestus.*" (*Pomp. Meli*, lib. i. cap. 7.) The dangers of the Syrtis have also been frequently alluded to by the poets, who have given it the epithet of inhospitable:—

— "per inhospita Syrtis  
Litora, per calidus Libye sitientis arenas."  
Lucan, lib. i. v. 367.

See also *Virgil, Æneid*, l. v. 110.: *Horace*, *Od. i.* 22, &c.

But though the navigation of the greater and lesser Syrtis, especially the former, be not free from danger, this has been greatly exaggerated by the ancients. During strong N. gales a very heavy sea is certainly thrown into the gulph, and the S. shore being low and sandy, a considerable portion of it is submerged, and the waters of the entire gulph have an extremely agitated and turbid appearance; but in ordinary weather it may be navigated by middling-sized vessels with little or no difficulty. "The gulph of Sidra," says Captain Smyth, "has few or no dangers, excepting little heads of rocks scattered about different points, and the tides are insignificant. With the hand-lead going, a vessel may approach all parts; but of what utility can it be to enter here, there being but one place in the whole gulph worthy to be called a port? We could find anchorage for small vessels only at Bushaifa and Braiga, at the bottom of the gulph; and Gharra Island, Karhara, and Bengazy [which see], on the E. coast."

But it is obvious from this statement, and from the want of harbours and roadsteads, that when the vessels of the ancients, who had comparatively little skill in navigation, got embayed in this gulph during the prevalence of northerly gales, they must have been in an exceedingly perilous situation, and we need not therefore be surprised at the exaggerated terms in which they have described its terrors.

The coast-lands, except at the bottom of the gulph of Sidra, where the desert and sea are conterminous, are here, as in the rest of N. Africa, extremely fertile. These, however, seem to be the only valuable portions of the surface. The Atlas ranges approach nearer to the sea here than in most other parts of Barbary, and immediately beyond them the country is a sandy arid desert. Tripoli has no river of any consequence, though a number of small rivulets descend from the mountains to the sea. Neither are there any lakes in the country, which, accordingly, depends for its irrigation and consequent fertility almost solely upon the rains. These, when they occur, fall incessantly for several days and nights; they then cease suddenly, and not a drop more descends for several months together. The most severe famines are

sometimes experienced from a continuance of drought; but when this is not the case, the country appears to have lost none of its ancient productiveness. According to Mr. Blaquiere, "A more luxuriant tract than that in the immediate neighbourhood of the capital cannot be imagined. Country-houses, extensive pleasure-gardens, groves of orange-trees, and innumerable fountains, together with the incessant progress of vegetation, form an assemblage of rural beauty here which is rarely to be met with. The fairy scene does not, however, reach more than 5 m. inland; when nothing but an immeasurable waste of sand is presented to the eye, and forms a striking contrast with the cultivated fields, to the edges of which it approaches. It should be observed, that a want of industry, and of proper encouragement from the government, are the only reasons why cultivation is not extended beyond its present limits. There is probably no country so highly favoured by nature as this is with respect to a rapid succession of the crops. The rains generally begin after gathering the dates, towards October, in the beginning of which month the Arabs plough and sow their grounds. In December and January the weather becomes dry and extremely pleasant, like our spring in England. In the beginning of April, the market before Tripoli is abundantly stocked with cattle, poultry, and vegetables of every kind. Towards June, almonds, figs, apples, pears, plums, peaches, nectarines, grapes, and melons are in season, and incredibly abundant. Cotton has been cultivated very successfully by various individuals; but, owing to a want of encouragement, does not form an article of export. Formerly, a quantity of raw silk formed one of the exports; but its cultivation has latterly been neglected. Mulberry trees are, however, to be found near the capital in great numbers, so that silk may at any time become again a staple commodity of the country. The castor-tree (*Ricinus Palma Christi*) is found in the vicinity of Tanjoura, where a great deal of that oil is made annually, though it has not hitherto been exported in any great quantity." (*Blaquiere*, in *Mod. Trav.* xx.) The exportation of corn, which otherwise would be very considerable, is prohibited except when carried on by the pacha for his exclusive benefit. Tobacco, saffron, madder, &c. are grown in small quantities; senna and galls are produced in the mountains, and the cassab and lotus are indigenous. But dates constitute the principal food of the inhabitants. The dates of Tripoli are finer than those of any other part of Barbary, and, besides its fruit, the date-tree yields a juice called *laghibi*, which, when drunk fresh, is a very agreeable beverage, and, when sufficed to ferment, forms an intoxicating fluid, "in great request among the Mohammedans, notwithstanding the prohibitions of the Koran." (*Della Cella*, 16.)

Each village is usually surrounded by plantations of date and olive trees, the surplus produce of which, with the straw mats, earthen jars, &c., made by the villagers, are partly exported, but are mostly disposed of to Bedouin traders. The vines along the coast yield grapes and raisins of the finest quality, and might be made to produce excellent wine. According to *Della Cella*, the neglect of such an advantage is less owing to the denunciations of the prophet than the exceeding sloth and ignorance of the people. Cattle, sheep, and poultry are reared in large numbers in some places; and, as animal food is little consumed, they are principal objects of exportation. During the war, Malta drew large supplies of cattle and other live stock from Tripoli, and still imports most part of the cattle sent out of the country. Beef, though small, is very good, as is lamb; mutton is of inferior quality. A kind of wild cattle, the wild hog, antelopes, bustards, and several other wild animals useful to man, are met with in abundance. Large beds of rock salt exist in different parts of the country. On the coast, fish of every kind are most abundant; but, with the exception of a few boats employed from the capital, fishing does not form a part of public industry.

The natives of this regency manufacture carpets, bournouses, haiks, and other woollen fabrics, camlets, mounts of palm leaves, goats' hair sacks, Morocco leather of different kinds. Carthenware, prepared skins, and a few other articles. The manufacture of potash, like the exportation of salt, is a monopoly of the bey. The principal trade consists in the barter of European produce for those of the Interior of Africa. From Tripoli, caravans go to Mourzouk, where a large fair is held in Dec. and Jan., and to which the products of Bornio, Sokotoo, Houssa, Timbuctoo, &c. are brought. (See art. FEZZAN in this *Dict.*, I. 836.) The Fezzan merchants proceed in Feb. and March to Tripoli, where they receive their goods for the 8. upon credit, paying by exchange one year for the goods purchased in the preceding. They bring from the interior annually about 1,500 negro slaves, 10,000 *metacadi* (small parcels, each worth a Venetian sequin), of gold dust, 700 ewt. of natron, 1,600 quintals of senna leaves, &c. The articles they take back are swords, pistols, moccas, pearls, brass, tin, coral, writing paper, cotton stuffs, &c.; and

these articles, with provisions, colonial produce, timber-pluch, spirits, cochineal, indigo, damask, and other silk fabrics, spirits, looking-glasses, toys, &c., constitute the principal imports from Europe. The exports from Tripoli by sea are wool of excellent quality, mantles, and other articles of dress, oil, senna, and other drugs, madder, barilla, hides, goat and sheep skins dressed, dates and other fruits, cattle, ostrich feathers, iron, gold dust, saffron, &c. (For further details see succeeding article.)

The government is in the hands of a bey, or pacha, who rules with despotic sway, and is chosen from among the Turkish officers resident in Tripoli, being confirmed in his authority by a firman from the Turkish sultan. He presides in the divan, and is assisted in his various duties by a bey-commander-in-chief; an aga commanding the Turkish soldiers; the *kaya*, or grand judge, who dispenses justice daily at the castle gate of the capital; the chief officers of the treasury and household; the *sheik-el-bled*, or head police magistrate; the *mufli*, or head of the priesthood; the *cadi*, or judge in matters respecting the Mohammedan faith, &c. The district governors seem to have powers equivalent to the bey, in their own districts; thus, the aga of Mesurata, besides his military attributes, unites in his own person all the judicial and legislative powers of the state, if we may so describe the functions exercised by an officer uncontrolled either by equity, reason, custom, or public opinion. (*Della Cella*, p. 45.) The revenues of the bey are derived from the tribute of the district governors, and the Arab tribes in the interior, taxes on the Jews and merchants, a tax of 10 per cent. on all land-produce, import and export duties, monopolies, presents, and exactions, fines for the mitigation of punishment, confiscations, &c.; their amount being estimated by Blaquiere at from 25,000*l.* to 26,000*l.* sterling a year; in addition to which a large portion of the necessities for his use are procured by extortion from his subjects. His standing army is said to amount to 3,000 men; but in time of war an army of 10,000 irregular cavalry and 40,000 foot may be raised by levies from the Arab tribes. The naval force is insignificant, consisting almost wholly of a few small vessels.

The character of the natives of Tripoli appears to be very indifferent. Captain Lyon says drunkenness is more common than in most towns in England. There are public wine-houses, at the doors of which the Moors sit and drink without any scruple; and the greater part of the better sort of people also are great drinkers. Blaquiere says he was unable to discover any good qualities to be contrasted with the well known attributes of revenge, avarice, treachery, and deceit, which predominate alike in the prince and the peasant. There is probably no country on earth where the inhabs. are more inclined to be vicious. (*Blaquiere*, in *Mod. Trav.* xx. 50.) And yet it is said such is the promptitude with which justice is administered, that crimes in Tripoli are less frequent than in European countries, and the people are more civilised than in most parts of Barbary. Intolerance towards Christians was formerly very strongly marked; but foreigners are now treated with respect, piracy and Christian slavery having been wholly abolished.

This territory contains some Roman antiquities, but they are much less frequent than in the adjacent territory of Barca. In the middle ages it generally shared in the fortunes of the rest of this portion of Africa. In 1522, Tripoli was given by the Emperor Charles V., who had become possessed of some authority over it, to the Knights of Rhodes; but these were driven from it by the Turks in 1551. Fezzan was rendered tributary about 1714; but the authority of the pacha, over either that country or Barca, appears to be little more than nominal, or at any rate very much disturbed.

TRIPOLI (*an. Gar*), a maritime city of N. Africa, cap. of the above regency, on a low rocky tongue of land, projecting into the Mediterranean; the castle being in lat. 32° 53' 56" N., long. 13° 10' 57" E. Pop. estimated at 25,000; 2,000 of whom are Jews, residing in a suburb of their own. The town is much smaller than either Algiers or Tunis; it may be  $\frac{1}{2}$  m. in length, by 5 furlongs in breadth; but its shape is very irregular. It is encompassed by high and thick walls, the original stone-work of which appears to have been very good; but they have been patched up in all directions with mud and fragments. A good many cannon are mounted on the ramparts, and Tripoli has some degree of strength as a fortress; it is entered by two gates, one to the E. and the other to the S. Viewed from the sea, the town appears to be semicircular; and the extreme whiteness of the square flat buildings, covered with lime, which in this climate encounters the sun's fiercest rays, is very striking. The baths form clusters of large cupolas, to the number of 8 or 10, crowded together in different parts of the town. The mosques are in general surrounded by plantations of Indian figs and date-trees, which at a distance, give the whole city a novel and

pleasing aspect. Internally, however, it has narrow and irregular streets, and mean houses. The pacha's castle is at the E. end, within the walls, with a dock-yard adjoining. It is very ancient, and inclosed by a high strong wall; and the numerous buildings which have been added at different periods to its interior, to receive the junior branches of the royal family, have both deprived it of all symmetry, and increased it to a little irregular town. (*Mod. Trav.*) Tripoli is, in most respects, inferior to the capitals of the other Barbary regencies. All Bey, however, says, "In point of tranquillity and cleanliness, Tripoli might be taken as a model by some European towns in the Mediterranean. Though it possesses neither the elegance nor the regularity of Valetta, you never hear of acts of violence being committed in the streets, and robberies are altogether unknown; the result of a well-mounted police. Independent of a nightly patrol, there is a guard stationed in each street, who is responsible for whatever may occur in it. There is, besides, always a number of persons kept for the express purpose of sweeping the town. The caravanserais, mosques, and houses of the different consuls and higher classes, are usually built of stone, and regularly whitewashed twice a year; the dwellings of the lower orders are of earth, small stones, and mortar. Tripoli has 6 mosques of the first rank, with minarets, and 6 smaller ones. The great mosque has a roof composed of small cupolas, supported by 16 elegant Doric columns of fine grey marble." There are 3 synagogues, one or two places of worship for Christians, several market-places, cafés, European hotels, &c. E. of the town, on a tract of rocky and elevated ground, is the site of the ancient cemetery, where several remains of antiquity have been discovered; and some portions of Roman tessellated pavements, fragments of columns, and entablatures, built up in modern walls, are met with in the city. The most striking relic of antiquity, however, is a magnificent triumphal arch, near the marine gate, at present used as a storehouse. Though half sunk in sand, its upper part is still in good preservation; and an inscription shows that it had been erected in 164, in honour of the emperors Aurelius Antoninus and L. Verus. It is built of huge blocks of marble, without cement, and has been ornamented with warlike trophies and other carvings in relief. The ceiling, also, is beautifully sculptured. (*Lyon, Trav. in N. Africa*, p. 18.)

The harbour of Tripoli, though not very spacious, is safe, and capable of accommodating a large fleet of merchant ships. Small frigates, whose draught of water does not exceed 18 ft., may also ride there in perfect safety. (*Alaquiere, Letters*, i. 23.) It is formed by a long reef of rocks running out to the N.E., and by other reefs to the E. In the deepest part there are from 5 to 6 fathoms water. It is defended by the new Spanish and French forts, the reef and insulated rocks on the W., and by two other forts on the beach to the E. It is the principal entrepôt for the maritime trade for the regency. We subjoin an

ACCOUNT of the principal Articles of Import and Export at Tripoli in 1836, with their estimated Value in France:—

Imports.		Exports.	
Articles.	Value in fr.	Articles.	Value in fr.
Wheat and barley	521,581	Mantles	57,990
Beans and peas	108,256	Oil	9,383
Wool	82,257	Hides, &c.	10,813
Hardware	20,289	Saffron	4,070
Coffee	26,779	Senna	7,003
Sugar	20,951	Wool	5,837
Cotton, manufactured	114,908	Cattle	3,939
Wines	22,896	Various	31,533
Various	472,035		
Total	1,390,536 fr.	Total	130,567 fr.

But it is obvious that this statement is but little to be depended upon; and that there can be in reality no such difference between the imports and exports. If the amount of the former be not overrated, we may be quite sure that that of the latter must exceed one million francs.

TRIPOLI, or TARABLUS, a town and sea-port of Syria, cap. of the pachalik of its own name, on the Mediterranean, 130 m. S.W. Aleppo. Lat. 34° 26' 22" N.; long. 35° 51' 22" E. Pop. estimated at 15,000. The town stands at the foot of a branch of Mount Lebanon, on a small triangular plain at some little distance from the sea: the Marina, S.W. from the city, on a projecting point of land, is the place where merchant ships usually load and unload their cargoes. Tripoli is one of the neatest towns in Syria, and is surrounded by fine gardens; but its neighbourhood being marshy, its climate is frequently unhealthy. It is traversed by the small river Kadisha, which, however, is too shallow to be navigable even for boats. The houses are principally of stone, and many parts of the city bear traces of the architecture of

the Crusaders, particularly some high Gothic arcades over certain streets; but there are no public buildings worth notice. Tripoli is commanded by an old castle on the heights behind, built during the crusades by the Count de Toulouse. The name *Tripoli* is, no doubt, derived from its being formerly divided into three separate towns at short distances from each other; and, in fact, El Miba, as the Marina is sometimes called, is distinct town from Tripoli proper. Numerous granitic columns and other ruins may still be seen along the shore (*Poeseke, Burckhardt, &c. in Mod. Trav.*) The port of Tripoli, to the N. of the Marina, and opposite the town is merely a roadstead, sheltered on the W. by some rock islets; and is safe only in fine weather. It is dangerous in winter, and particularly at the equinoxes, from the foulness of the bottom and the prevalence of strong gales. (*Purdy's Sailing Direct.*) It has, however, some trade, exporting silk, wool, cotton, and tobacco, with small quantities of oil, wax, cochineal galls, and soap manufactured in the town. There are numerous Greek among the inhab., and a large share of the trade is in their hands. It is, also, the see of a Greek bishop, and the residence of several European consuls. (*Burney's Rep on Syria; Mod. Trav.*)

Tripoli was taken by the Crusaders in 1108. It has previously been one of the most flourishing seats of oriental literature, and possessed a very large collection of Persian and Arabic works. It is said that 100 copyists were constantly kept employed copying manuscripts, and that the princes of Tripoli were in the habit of sending messengers into foreign countries to discover and purchase rare and valuable works. Unfortunately, however, this extensive and precious collection, amounting, it is said to 100,000 vols., was destroyed by the Crusaders, who displayed on this occasion the same fanatical zeal of which they have accused, though we believe unjustly, the Arabs in the case of the Alexandrian library. (*See ALEXANDRIA*.) A priest in the suite of Count Bertrand de St. Gilles, having visited an apartment of the library in which were a number of duplicate copies of the Koran, reported that it contained none but the impious works of Mohammed, and that, consequently, it should be destroyed! And, as a matter of course, it was forthwith set on fire.

Babji, despite his pretensions to superior criticism and sagacity, states, after Quatremere de Quincy, that this library contained no fewer than 3,000,000 vols. 1. (*Bibliothèques de France*, p. 81.) Michaud most properly rejects this statement as incredible and absurd, and adopts in preference the reasonable account given by Nuvairi. (*Histoire des Croisades*, ii. 43, ed. 1841.)

TRIPOLIZZA, or TRIPOLITZA, a town of the kingdom of Greece, cap. dep. Mantinea, and under the Turks, the cap. of the Morea, near the centre of which it is situated, 20 m. S. by W. Argos. It stands in a plain nearly 2,000 ft. above the level of the sea, and before the late war was about 3 m. in circuit, and probably more populous than Athens; but we can form no estimate of its present population. It is of modern origin, and is supposed to owe its name to its having been principally constructed of the ruins of the three cities of Tegea, Mantinea, and Pallantium, the sites of all which are at no great distance. Previously to the Greek revolution it had some large and conspicuous buildings; but it suffered severely during its capture and sack by the Greeks in Oct. 1821, and its ruin was completed when it was retaken by Ibrahim Pacha in 1825; indeed, an arched gateway is now said to be the only existing relic of the Turkish period. (*Mure's Journal*, ii. 217.) But it is again rising from its ruins, and is the seat of one of the first class treasures in Greece and of other government establishments. It is said, however, that the government contemplates the removal of these to some other town; and if so, it is not very probable that Tripolizza should ever regain its former importance. (*Gell's Burgess's Greece*, &c., i. 210; *Strong's Greece as a Kingdom*, &c.)

TROAD (THE), or site of the ancient city of Troy, and the scene of the battles described in the Iliad. The situation of this classical region has been pointed out with sufficient precision by Homer, and has been admitted, from the earliest antiquity, to comprise that portion of Asia Minor bounded by and immediately S. of the W. entrance to the Hellespont, opposite the island of Tenedos, having Mount Ida on the E. and the gulph of Adramytti on the S. Here, no doubt, are the *campi ubi Troja fuit*:—

"Hæc ibi Simois; hic est Sigeia tellus;  
Hic steterat Priami regia cœna senilis;  
Illiæ ædifices, illic tendebat troyes;  
Hic lævæ admissæ terribil Hector equos."  
Ovid. Epist. l. lin. 33.

But, notwithstanding the immortality of renown that has been conferred on the "heaven-built" city, and the interest which the Troad has always excited, such and so great have been the changes brought about by the li-

fluence of war, the ravages of barbarians, and the lapses of ages, that it is now no easy matter to reconcile the descriptions of Homer with the existing appearances of the country.

The Troad has been examined by several learned travellers, including Chandler, Wood, Chevalier, Clarke, Hobhouse, Gell, and others. But as none of them had the means of making a proper topographical plan of the country, and as its appearance, and especially the magnitude and even number of the rivers, differs at different seasons of the year, we need not be surprised at their conflicting statements, even had they not been mostly under the influence of some preconceived theory. The system of Chevalier, which for a while was pretty generally acquiesced in, was founded on the assumption that the Menderes, the principal river of the Troad, was the Simois, and that the small river to the S. of the latter, the Bour-nabashi or Kerki-joss, was the Scamander of Homer. This hypothesis is now, however, generally abandoned, and it is indeed surprising it should ever have obtained currency.\* Inasmuch, however, as it would be impossible to make minute details intelligible without the aid of a map, we shall merely observe that Major Hennel and Mr. Maclaren have all but demonstrated that the Menderes is identical with the Scamander of the Iliad; and the suggestion of Dr. Chandler, that the Thymbrius, (now the Dumbuck-soû,) a river to the N.E. of the Menderes, with which it unites before they fall into the sea, is the Simois of Homer, appears to be satisfactorily established by Mr. Maclaren. It is, in fact, the only river in the Troad, excepting the Menderes, that in any respect corresponds with the descriptions given in the Iliad of the Simois; and the plain between the Menderes and the Thymbrius is the only one of sufficient extent to allow of the battles described by the poet being fought.

Dr. Clarke has conclusively shown (iii. 133, 8vo. ed.) that the ruins at *Palao Callifat*, or *Isarlik*, are certainly those of the New Ilum of Strabo. They are situated on a rising ground about 3 m. from the sea, and about midway between the Menderes and Thymbrius. Here the learned traveller found not only the traces but the remains of an ancient citadel; and at the very moment of his visit the Turks were employed in raising vast blocks of marble from the foundations of this edifice, which exhibited the colossal and massive style of architecture peculiar to the early ages of Greek history. The ground around was covered with fragments of broken pottery, and medals have been discovered among the ruins.

In the time of Strabo, New Ilum, whose position is thus clearly identified, was believed by its inhab. to occupy the identical site of the ancient city, and such had been the belief uniformly entertained by them from the earliest period: "Hence," says Tacitus, "*Iliness antiquitatis gloria pollebant* (Annal. lib. iv. cap. 55.) Strabo, however, places the old city considerably more to the E., but we agree with Mr. Maclaren in rejecting this statement, and in believing that the old and new city stood upon the same site. The fact is, that a city taken by an enemy, and given up to military execution, is never completely destroyed; the foundations, with portions of its walls and temples, are always sure to remain, and these with the ruins afford many facilities for the construction of a new city. There is no reason to think that the destruction of Troy was in any respect more complete than that of Thebes by Alexander the Great, and yet the latter was rebuilt in the course of 20 years. And it is further to be observed that the conqueror now named visited New Ilum, in the full conviction that it represented the ancient city, sacrificed to Minerva and the manes of Priam, conferred immunities on the inhab., and gave orders that the walls of the town should be rebuilt, which intention was carried into effect after his death by Lysimachus. It is childish to suppose that Alexander should have done this unless he had been satisfied of the identity of the old and new city; and neither Arrian, nor any one else of his historians, so much as insinuates a doubt upon the subject. It would be rash and unwarrantable to set aside such evidence on the sole authority of Demetrius of Scepsis, who has, in this instance, been followed by Strabo, more especially as it has been shown that the site of New Ilum corresponds incomparably better with the Ilum of Homer than any other site on the Troad.

Perhaps it may be said, that, before endeavouring to point out the situation of Troy, it might have been as well to inquire whether that city ever existed, and whether any such war as that of Troy was ever carried on. But such inquiries would be wholly misplaced in a work of this kind; and though it had been otherwise, they would be wholly superfluous. It is the mere wantonness of scepticism to call in question the existence of Troy. Even if there were nothing more, the Iliad, which obvi-

ously describes real and not fictitious events, would be conclusive of the question; and when we add the concurrent testimony of the most ancient and best Greek authors, including Hesiod, Herodotus, and Thucydides, and the traditions universally prevalent as to the event, we should be quite as much disposed to deny the existence of Nineveh, Babylon, or even Jerusalem, as of Troy.

Exclusive of Troy, the Troad contained, at a later period, some other cities, such as Sigeum, on the sea shore, at the mouth of the Hellespont, near the promontory of the same name, and adjoining the burrow or mound called the tomb of Achilles. It was founded posterior to the siege of Troy by an Æolian colony. It had, however, ceased to exist in the time of Strabo. But the town of Alexandria Troas, on the coast, about 17 m. S. from Sigeum, was by far the most important of the towns in the Troad built after the destruction of Troy. It was founded by Antigonus, one of Alexander's generals; and became, under the Romans, one of the most flourishing of their Asiatic colonies. (Strabo, lib. xiii.) It is twice mentioned in the "Acts of the Apostles," and was the scene of a miracle. (Acts, caps. xvi. and xx.) Its site, now called Eski Stambul, is identified by the remains of walls and other buildings, including a theatre, gymnasium, a magnificent aqueduct, &c., that sufficiently attest its ancient magnificence. (See *Chevalier on the Plain of Troy*, with Notes by Patzelt, 4to., 1791; *Rennell on the Topography of the Plain of Troy*, 4to., 1814; *Chandler's History of Ilium or Troy*, 4to., 1802; *Maclaren's Dissertation on the Plain of Troy*, 8vo., 1822, &c. In 1791, (most probably, for the date is not given), Mr. Bryant published at Eton his singular Dissertation, to shew that no such city as Troy ever existed, and that the expedition against it never was undertaken. This Dissertation was answered, and, as we think, completely refuted, by Mr. J. B. S. Morritt, in his Vindication of Homer, 4to., 1798; a variety of other tracts have appeared on this curious question, but the above, with the replies of Bryant and Morritt, exhaust the subject.)

TRONDHJEM (vulg. *Drontheim*), a town and seaport of Norway, cap. prov. of its own name, on the Nid (whence its name *Nidrosia*) at its mouth, in the deep gulph called Trondhjem-fjord, 275 m. N.E. Bergen, lat. 63° 25' 50" N., long. 10° 23' 25" E. Pop. in 1835, 12,358. A great deal of expense has been incurred in its fortification; but, as it is commanded by heights beyond the Nid, which surrounds it on the S. and E. it is not really strong. The fortress of Munkholm, bristling with cannon, stands on a small island in the fjord opposite the city; but it is, perhaps, more serviceable as a prison than a military outwork.

Trondhjem is, on the whole, well built, though its houses be almost all of wood. The streets are spacious, with water cisterns at their intersections; and the town has a singular air of cleanliness and comfort. The most remarkable edifice is the cathedral, built principally of stone, and founded early in the 11th century, though little of the original structure remains; that little, however, is enough to show that it had been originally one of the most magnificent ecclesiastical structures in Europe. (Clarke's *Travels*, x. 232.) Part of the architecture is Saxon, the rest Gothic, and round and pointed arches are frequently intermixed. The extreme length has been 346 ft., and its breadth 84 ft.; but the W. end, where was the grand entrance, had a chapel at each corner, making the breadth of that front 140 ft. (*Laing*, p. 65.) Only the transept and E. end of the building are now roofed in and used; the W. part serves for a timber yard. There are three other churches, all plain structures; an hospital for the aged and infirm; a workhouse; a public library and museum, in which are collections of books, minerals, natural history, and antiquities, better than might have been expected in so remote a part of Europe; a public grammar-school, Lancaster schools, a theatre, and many hospitals and charitable institutions. The palace of the military commandant, though constructed wholly of wood, was, in the opinion of Clarke, the first edifice of its kind in Scandinavia. There are no regular inns in Trondhjem, but several good boarding houses.

The town is governed by a corporation of twelve persons, elected from among the mercantile body; and is the seat of the superior courts, &c. for all the country N. of the Dovre-field. The roadstead of Trondhjem is but indifferent, being unprotected both on the N. and W., and the bottom loose ground in 20 fathoms: the river does not admit vessels drawing more than 10 or 12 ft. water. Dried fish, tar, deals, and copper from Rørosa, are the principal articles of export.

According to Dr. Clarke, Trondhjem-fjord never freezes, and the cold of winter, though severe, is not nearly so great as at Rørosa, which lies more to the S. The surrounding country is studded with merchants' villas; and immediately beyond the town is an extensive suburb, reached by a good wooden bridge across the river.

Trondhjem is now connected by a continuous carriage-

\* Chevalier's theory has been opposed by Cramer; see *Mss Asia Minor*, i. 97, &c.; but he adds nothing to Chevalier's statements, and does not seem even to have been aware of the existence of Mr. Maclaren's work.

road with the Swedish capital; and in 1838 a government steam-boat commenced running between Trondhjem and Hammerfest, calling off Tromsø and other intermediate ports, from spring till Sept. English is understood and spoken by many of the inhabs. Mr. Barrow says the manners and appearance of the upper classes nearly resemble our own; and most of them are, in fact, more or less connected with mercantile houses in England, many having been educated in England, and others being accustomed to visit it once a year. (*Barrow's Excursions in the N. of Europe*, pp. 345, 346.) The lower classes generally read and write; and among the opulent many are distinguished for their literary taste. (*Clarke, Preface to Scandinavia*, x. &c.; *Laing; Barrow*, &c., passim.)

TRONIS RIVIERES. See THREE RIVERS.

TROND (ST.), Flem. *St. Trigen*, a town of Belgium, prov. Linbourg, cap. cant., on a tributary of the Demer, 20 m. W. by St. Maestricht. Pop., in 1836, 8,490. It is supposed to owe its origin to a Benedictine abbey, founded here in 657: it was formerly fortified; but its works were dismantled in 1697. It has a considerable manufacture of fire-arms; and some trade in lace, leather, &c. A singular action took place between the French and Austrians, in its vicinity, in 1793.

TROON, a sea-port town of Ayrshire, on a point of land projecting into the sea, 6 m. N. by W. Ayr, and 8 m. S.W. Kilmaronock. Pop., in 1841, 2,148. It is a neat, well-built town. The par. church is at Dinnonald, about 4 m. distant; but it has a chapel-of-ease and a chapel belonging to the United Secession church. Troon Harbour, on the N. side of the promontory on which the town is built, is the most accessible of any on the Ayrshire coast, has 16 ft. water at low spring ebbs, and sufficient accommodation for a great number of ships. Its advantages had, however, been wholly neglected till it came into the possession of its present noble proprietor, the Duke of Portland, who has constructed a large dry or graving dock, not surpassed by any other in Scotland, for the building or repair of vessels of large size; a smaller do.; and is now constructing a wet dock, that will accommodate 50 sail. It is also furnished with commodious warehouses, and a harbour-light. Through the exertions of his Grace, the Troon has been united, by a railway, with Kilmaronock, by which it has been made, to some extent at least, the port of the latter. Great quantities of coal are raised in the vicinity, which, being brought to this port by the railway for shipment, are exported to the amount, in ordinary years, of about 168,000 tons. Ship-building employs from 100 to 200 hands; and rope and sail-making, and the trades connected with them, are also carried on to some extent. About 4,000 tons shipping belong to the port. Branches of the Ayr Bank, and of the Glasgow Union Bank, have been opened in the town. The Glasgow, Paisley, and Ayr Railway, passes within less than a mile of Troon, with which it is about being connected by a branch railway. (*Private Information*.)

TROPEZ (ST.), a maritime town of France, dep. Var, on a bay of the Mediterranean, 34 m. E. by N. Toulon. Pop., in 1836, 2,637. The inscriptions, medals, &c., found here, prove that it occupies the site of *He-raclea*, an important maritime town of antiquity. It has a citadel, and towards the sea is defended by some old walls; its port is spacious and good, but is little frequented, except by fishermen, which comprise a large proportion of its inhabs. St. Tropez is the seat of a tribunal of commerce, a council of *prud'homme*, and a school of navigation.

TROPPAU, a town of the Austrian dominions, cap. Austrian Silesia, and of the principality and circle of its own name; on the Oppa, a tributary of the Oder, 37 m. N.E. Olmutz. Pop., in 1837, including its suburbs, 12,556. It is well situated, is walled, and entered by four gates, and is well built. Its principal edifices comprise a castle, town-hall, theatre, high school, and sundry churches. It is the seat of courts for its province, circle, and duchy, a tribunal of commerce, a gymnasium, to which a flourishing museum was attached in 1814, and considerable manufactures of woollen and linen fabrics, with others of soap, leather, liquors, &c. Troppau was, from 20th Oct. to 20th Nov. 1820, the place of meeting of the diplomatic congress, which afterwards removed to Laybach. (*Oester. Nat. Encyc.*; *Berghaus*.)

TROY, a town or city of the United States, in New York, co. Rensselaer, of which it is the cap., on the Hudson River, 7 m. N.E. Albany. Pop., in 1830, 11,408; in 1840, 19,334. It stands on the alluvial flat on both sides the river, but principally on the E. bank, where it is backed by some eminences dignified with the names of Mounts Ida, Olympus, &c. It is regularly laid out, most of the streets crossing each other at right angles; and well built, the houses being commonly of brick, and some of stone. The thoroughfares are, in general, about 60 ft. in breadth, macadamised, shaded with trees, and well lighted. Many of the public buildings are elegant, particularly the court-house, with a Grecian front, and the episcopal church, one of the finest specimens of

modern Gothic architecture in the United States. There are many churches for other sects, 2 large female seminaries, the Rensselaer Institute, a library of natural history, academy, Lancasterian school, orphan asylum, house of industry, county prison, mechanics', national, and other halls, several banks, &c. "The city is abundantly watered by subterranean iron pipes from a basin in the neighbouring town of Lansingburgh, 72 ft. above the city plain. The height and volume of water are sufficient to furnish jets d'eau in the city, and to throw large streams, in case of fire, through hose, without the intervention of engines. The supply of water is 1,500,000 gallons per day; the cost of the works 120,000 dollars, for which a large debt remained in 1835 on the city." (*New York Gazetteer*.) Two streams join the Hudson within the city, and afford water power for many factories. Troy had, in 1835, 8 flour and 4 cotton mills, with paper and slitting mills, nail and iron works, breweries, tanneries, and leather factories, 2 carriage factories, where were built, in one year, 150 stage coaches, &c. "The trade of Troy by land is with an extensive range of country E. and N., within which there are 67 cotton factories, using annually more than 3,500,000 lbs. of cotton; and 40 woollen factories, making up annually more than 1,000,000 lbs. of wool. The merchants and millers have, in one season, purchased more than 500,000 bushels of wheat, 150,000 bush. of other grain, and 25,000 barrels of provisions, besides large quantities of lard, butter, cheese, &c." (*New York Gaz.*) The canal trade had nearly doubled between 1829 and 1835. W. Troy is on the United Champlain and Erie canal, and at present communicates with the rest of the city by 3 steam-boat ferries; though the erection of a bridge is in contemplation. Rensselaer and Saratoga railroad crosses the Hudson at Troy by a bridge 1,600 ft. in length, resting upon 8 stone piers. Troy was first incorporated in 1796, and has now become the third city in the State, in wealth and importance. (*New York Gaz.*; *Amer. Almanac*.)

TROWBRIDGE, a market town and pa. of England, co. Wilts., hund. Melksham, on a tributary of the Avon, the Wore, which is here crossed by a stone bridge, 21 m. N.W. Salisbury. Area of par. 1,950 acres. Pop. in 1841, 10,863; in 1841, 11,050. The principal street is spacious, but the others are generally narrow and inconvenient, and though some of the houses are good, the greater proportion are but indifferent. Many are, however, constructed of stone, and the town is paved, and lighted with gas. Trowbridge Church, a large and striking edifice, consists of a nave, chancel, two side aisles, with attached chapels, in the windows of which is a good deal of stained glass, and lofty N. and S. porches. The two side aisles are separated from the nave by five pointed arches, springing from clustered columns, and are externally ornamented and ornamented with crocketed pinnacles; at the N. extremity is a large tower with a tapering spire. The living, a rectory, worth 600*l.* a year, is in the gift of the Duke of Rutland. Trinity Church, at the W. end of the town, erected within these few years, is a fine building, with a considerable number of free sittings. It has, also, meeting-houses for General and Particular Baptists, Presbyterians, Wesleyans, Independents, &c., (dissenters being very numerous in Trowbridge); a free school and an almshouse, and most of the different sects support Sunday-schools. The manufacture of woollen cloth was established in Trowbridge at an early period. Cassimeres, fancy kerseys, tweeds, &c., and other narrow woollens, are the principal products. In 1839, 19 woollen mills were in full work in the par., employing together 1278 hands, and there may be in the town and its immediately contiguous district about 1650 looms. (*Hand-Loom and Factory Rep.*) But at present (1842) the trade is very much depressed. The Kennet and Avon canal passes about 1 m. N. of the town, placing it in communication with London on the one hand and Bristol on the other. Trowbridge is under the jurisdiction of the co. magistrates, who hold petty sessions here monthly, and a court of requests, for debts not above 5*l.*, every three weeks. Markets, Tuesdays, Thursdays, and Saturdays; fairs, Aug. 5 to 7, for cattle, pedlars, millinery, &c. Crabbe, the celebrated poet, was for 18 years rector of this par., where he died Feb. 3d. 1832.

TROYES (an. *Truce* and *Augustobona Tricastium*), a town of France, dep. Aube, of which it is the cap., on the Seine, which partly surrounds it, and is partly diverted into its interior by numerous canals, for the supply of its various factories, 92 m. E.S.E. Paris. Lat. 48° 15' 5" N., long. 3° 4' 49" E. Pop., in 1836, 25,563. It is inclosed by an old wall in pretty good condition, and has several suburbs. The town is but ill-built, most of its houses being constructed of timber; though some of its new quarters are clean and sufficiently well laid out. Before the Revolution, Troyes comprised 22 par., but their number has since been greatly diminished. The cathedral is a fine Gothic structure, chiefly constructed on the site of a previous edifice, in the 13th century, though not finished till towards the end of the 16th.

interior length is 374 ft.; breadth, 164 ft.; height of the vault, 96 ft., and of the cupola externally, 204 ft. There is a good deal of curious stained glass in this church, the figures representing the kings of France, counts of Champagne, bishops of Troyes, and other personages of the 13th century, in the peculiar costume of that period, and of the size of life. Some of the other churches deserve being visited. The town-hall is an edifice of the 17th century, with a handsome front, and a hall in which are the marble busts of the most distinguished natives of Troyes. The museum contains collections of mineralogy, natural history, and paintings; and the public library is said by Hugo and others to comprise 55,000 printed vols., and nearly 5,000 MSS. The hall in which these works are placed is about 160 ft. in length, and 30 ft. in width; and on its pannels are paintings by Gonthier, representing the principal achievements of Henry IV. The prefecture, bishop's palace, seminary, hospital, court-house, public baths, and *abattoir* are the other most remarkable buildings. The environs are particularly remarkable. It is the seat of courts of primary jurisdiction and commerce, a chamber of commerce, council of *prud'hommes*; the residence of an inspector-general of navigation, &c. It has manufactures of cotton, hosiery, calico, woollen cloths, blankets, and cotton and woollen yarn; with bleaching establishments, for which the water of the Seine is said to be most suitable; paper-mills, &c. Troyes was formerly the cap. of Champagne; and it was here that Hen. V. of England espoused Catherine of France. In 1429, it was taken from the English by the French troops, under Joan of Arc. In the campaign of 1814, it was the head quarters of Napoleon. Among the distinguished individuals, natives of Troyes, may be specified Pope Urban IV., the sculptor Girardon, and the painter Mignard. (*Hugo, art. Asie, &c.*)

TRURO, a rural, red man. bor. and market-town of England, co. Cornwall, hund. Powder, on the Fal, 7 m. N. by E. Falmouth, and 230 m. W.S.W. London. Pop. of par. bor. in 1831, 8,291. This is decidedly the handsomest, and including its suburbs, the largest town in Cornwall. It owes its increase and prosperity partly to its being in the centre of an important mining district, and a principal stannary town, and partly to its situation on a river navigable thus far at high water by vessels of 100 tons. The streets are partially paved, and lighted with gas. The town and bor. are comprised in the 3 pars. of St. Mary, Kouwyn, and St. Clement's. St. Mary's church is built of Roberorough stone, which, at first sight, seems like granite, in a rich and beautiful perpendicular style. The interior has, however, been modernised; and a modern steeple has been attached to the church. (*Rickman's Goth. Architect.*) The living, a rectory worth 135*l.* a year, is in the gift of Lord Mount Edgcumbe. There are meeting-houses for Independents, Wesleyans, Baptists, Unitarians, Friends, Bryaunites, and various other sects; and a grammar-school, founded in 1769, which has an income of 100*l.* a year, with two exhibitions at Exeter College, Oxford. Sir H. Davy received his early education in this school. It has also an almshouse, and several minor charities, town and cofnage halls, a county infirmary, barracks, theatre, workhouse, a small gaol, a subscription library, and several societies for instruction or amusement. The exports of Truro consist chiefly of tin and copper; with some paper and carpeting made in the town. Truro is of high antiquity; and had formerly a castle built in the reign of Henry II., and some other ancient edifices; but these no longer exist. It is said to be a bor. by prescription; its earliest charter appearing to have been one granted by Reginald, Earl of Cornwall, at an uncertain date, but certainly before 1280. It is now divided into 2 wards, and is governed by a mayor, 5 other aldermen, and 18 councillors. It has a commission of the peace, a weekly court of record, and some minor courts. Corp. rev., in 1840, 1,267*l.* It has sent 2 mems. to the H. of C. since the 23 Edward I., the right of voting, down to the Reform Act, having been in the mayor, and 26 capital burgesses. The old par. bor. comprised only the central part of the town, and the adjacent part of Kenwyn par.; but the Boundary Act at least doubled its former extent. Registered electors, 1839-40, 644. Markets, Wednesday and Saturday, and a cattle-market the first Wednesday in every month; fairs, four times a year, principally for cattle. Foote, the comedian, was a native of Truro, where he first saw the light 27th Jan. 1721. (*Parl. Boundary and Mun. Corp. Reports; and Appendix, &c.*)

TRUXILLO, or TRUJILLO, a town of Spain, in Extremadura, prov. Caceres, cap. dep., on the Tozo, a tributary of the Tagus, and on the high road between Madrid and Lisbon, 134 m. S.W. by W. the former. Pop. about 4,500 (*Mifano*). It is divided into the city, the old town, and the citadel, which successively occupy the foot, acclivity, and summit of a hill facing the S. The city is the newest portion; it is well laid out, and has a fine square, and several handsome residences, most of the wealthy inhabitants, having removed thither from the old town. In the

square is a large mansion, once belonging to the family of Pizarro, a native of Truxillo; the front of which is ornamented with bas-reliefs, representing the conquest of Peru. The old town, surrounded by a wall, is ill-built and dirty; but the castle, with a mixture of ancient and Saracenic architecture, is imposing; and the appearance of Truxillo at a distance is very prepossessing. It has the usual complement of churches and convents, with several hospitals, a college, post-house, &c., and manufactures of leather and linen fabrics. The name of this town appears to be a corruption of *Turris Julia*. It is supposed to be the *Castra Julia* of Ptolemy; and several Roman antiquities have been discovered in the town and neighbourhood. (*Mifano; Mod. Trav.* xix.)

TRUXILLO, or TRUJILLO, a town of Colombia, in Venezuela, cap. prov. of its own name, in a mountainous valley, 150 m. S.E. Maracaybo. Pop. estimated at about 8,000. It is said to have been one of the finest and most opulent cities of this part of America, previously to its being pillaged by the buccancer Gramont, in 1678, when most of its inhab. fled to Merida. The valley in which the city is built is so narrow, as to admit nowhere of more than two parallel streets, and the houses are small and mean. There are Dominican and Franciscan convents, a college, several schools, &c. The climate is healthy; the adjacent lands produce sugar, cocoa, indigo, coffee, and wheat; the mutton is larger and finer than in any other part of the prov. The inhabs. make superior cheese and preserves; and are famed for cleaning and carding wool. Its trade is principally northward with Carora and Maracaybo. (*Depons in Mod. Trav.* xxvii. 219.; *Codazzi, Géog. de Venezuela.*)

TSCHERKASK (NOVI or NEW), a town of European Russia, cap. of the country of the Don-Cossacks, on a hill adjoining a tributary of the Don, 290 m. S.S.E. Voroneje; lat. 49° 24' 29" N. long. 39° 38' E. Pop., according to Schnitzler, about 14,000, but, according to Pessart, only 12,000. It is wholly modern, having been founded under the auspices of Plاتف in 1805; its streets are regular and broad, but some years since they were neither paved nor lighted, and most of the buildings were of wood. A triumphal arch, of hewn stone, stands at either extremity of the main thoroughfare, and there is a large square in which Plاتف had begun to build a residence for himself. The town is a bishop's see; and has a new cathedral, gymnasium, circle-school, hospital, arsenal, &c. It is the seat of all the government offices for the Don-Cossack country, which were removed thither, in 1807, from Staro, or Old Tscherkask on the Don, about 10 m. S. by E. In consequence of the inundations to which the latter was subject. The new cap. is favourably placed to avoid this evil, but it labours under a great drawback in being near no navigable river. Staro-Tscherkask, which formerly had 15,000 inhabs., has now dwindled into insignificance. The new town has annually four large fairs; to one of which goods to the value of upwards of 2,000,000 roubles are frequently brought. (*Pessart Kaiserth. Russland; Schnitzler; Lyall, Trav. in Russia.*)

TUAM, an inland city of Ireland, prov. Connaught, co. Galway, on a small river, 15 m. E. Lough Corrib, and 105 m. W. by N. Dublin. Pop. in 1831, 6,883. This town has greatly improved, and increased in pop. during the last 20 years. Several new buildings are in progress. The principal streets diverge from the market-place, in the centre of the town; and some of them have latterly been widened and much improved. Still, however, much squalid poverty is to be found in the town and its wretched outlets. It is of considerable importance in an ecclesiastical point of view, having been till recently the seat of a Protestant, as it still is of a Catholic archbishop. But, in 1839, on the demise of the late Protestant prelate, the see was reduced from an archbishopric to a bishopric, suffragan to Armagh. The Protestant cathedral is a small plain building; but the Rom. Cath. cathedral is a splendid structure, and is, indeed, by far the finest of the modern Rom. Cath. churches in Ireland. It was, as is the Rom. Cath. college of St. Jarlath, founded in 1814, usually attended by about 140 pupils. It has also a nunnery, a dispensary, and other public schools, a court-house, a gaol, barracks, dispensary, &c. The town comprises the palace and handsome demesne of the Protestant bishop. Tuam sent 2 mems. to the Irish H. of C. down to the Union, when it was disfranchised. General sessions are held twice a year, and petty sessions on Wednesdays: it is a constabulary station. The manufacture of coarse linens and leather is carried on to some extent; and it has a brewery and flour-mills, and a weekly newspaper. Markets on Wednesdays and Saturdays; fairs, May 10., July 4., Oct. 20., and Dec. 15. Post-office revenue in 1830, 849*l.*; in 1836, 1072*l.* Branches of the agricultural and national banks were opened in 1836 and 1836.

It is worthy of remark, that, notwithstanding Tuam has been for a lengthened period the seat of a Protestant archbishop, with a large revenue at his disposal, there were, in 1834, only 428 individuals in the par. that be-

longed to the Established Church, whereas the Catholic pop. amounted to no fewer than 14,511! The country round Tuam is flat, badly cultivated, and the peasantry poor and depressed in the extreme. (*Municipal Boundary Report*; *Fraser's Guide to Ireland*, &c.)

**TUBINGEN**, a town of S. Germany, kingd. Wirtemberg, circ. Schwarzwald on the Neckar, 17 m. S.S.W. Stuttgart. Pop. in 1838, 7,250. It is old and irregularly built; its principal edifice is the castle, formerly the stronghold of the Pfalzgraves of Tubingen, but now appropriated to the university of Wirtemberg. This university was founded in 1477; and the famous reformers, Melancthon and Rauchlin, were among its earliest professors; it has both a Rom. Catholic and a Protestant theological faculty. In 1835, it was attended by 734 students; of whom 280 attended divinity, 82 law, 166 medicine and surgery, and 181 philosophy, &c. About 100 students were subjects of other German states. (*Journ. of Educ.*, vol. ix.) This university has an observatory, botanic garden, cabinets of mineralogy, zoology, &c., and a library. The chief support of the inhabs. of Tubingen is derived from the retail supply of this and the other public schools; but they have also a few manufactures of woollens, gunpowder, &c. (*Berghaus's Memminger Beschreibung von Würtemb.*)

**TUCUMAN**, the cap. of the state of the same name, in the S. American confederacy of La Plata, in a fertile plain on a tributary of the Medinas, and on the high road between Buenos Ayres and Potosi, about 315 m. N.N.W. Cordova; lat. 26° 49' S., long. 64° 55' W. Pop. estimated at 12,000. It has a cathedral, several convents, a Jesuit's college, &c.; but the inhabs. generally, from their remote inland position, appear to have made little progress in science, or the arts of civilised life. Their principal trade is in oxen and mules. Tucuman was founded in 1685. It is memorable in history as the place at which the declaration of the independence of the Plata provs. was first promulgated, and where their first congress was held in 1816. (*Dict. Géog.*)

**TUDELA** (an. *Tudela*), a city of Spain, prov. Navarre, in which it holds the second rank on the Ebro, where it is joined by the Quellos, and near the commencement of the great canal of Aragon, 50 m. N.W. Saragossa. Pop. 4,150 (*Milano*). The Ebro is here crossed by a noble bridge, of uncertain origin, 400 Spanish (or nearly as many English) yards in length, and having 17 arches. Tudela was formerly fortified, but nothing remains of its ancient walls, except the gates, or of its citadel more than one tower. Its streets are narrow, crooked, and dirty; its houses lofty, and mostly of brick; there are many private and some public fountains, and the remains, in several places, of baths, constructed by the Moors. Along the river are some shaded public walks. It has a cathedral, in which Blanche, of Castile, the queen of Peter the Cruel was buried, many other churches and convents, two hospitals, an orphan asylum, workhouse, prison, society of public good, Latin and medical schools, &c. Its inhabs. manufacture coarse woollens, hair fabrics, soap, tiles, bricks, and earthenware, and trade in oil, flour, and wine, esteemed the best in the prov. Tudela has two large annual fairs; one from 1st to 21st March, and the other from 22d July to 10th Aug. It has given birth to several distinguished characters, including, amongst others, the Jewish traveller of the 12th century, the rabbi Benjamin Ben Jonah, commonly called Benjamin of Tudela. On the 22d of Nov., 1809, a French army, under Marshal Lasnes, completely defeated, in the vicinity of this town, a greatly superior Spanish force under Castaños. The latter lost about 8,000 men, killed, wounded, and prisoners, and were completely dispersed. (*Milano; Napier's Peninsular War*, l. 4th.)

**TVER**, a gov. of European Russia, between the 56th and 59th degs. of N. lat., and the 32d and 38th of E. long.; having N. Novgorod, E. Jaroslavl and Vladimir, S. Moscow and Smolensk, and W. Pskov. Area estimated at 23,800 sq. m. Pop. in 1838, 1,227,500. The surface of this government is generally more elevated than that of other parts of European Russia; and several large rivers, as the Wolga, Tvertza, Mologa, Mednevitza, &c., rise within its limits. In its W. part are several lakes. The Wolga has its source in the lake of Selighur, and afterwards traverses the government in nearly its whole length from W. to E. The climate is severe, and the soil is but indifferently fertile. The harvests are precarious, and scarcely ever produce more than sufficient for home consumption. A good deal of hemp and flax, with beans, &c., are grown; but few kinds of fruit succeed. The forests are extensive, particularly in the N.; and about 319,000 declivities of forest land belong to the crown. Manufactures of little consequence, but increasing: those of dyeing materials and spirituous liquors are the principal; and there are others of bricks, glass ware, ropes, leather, woollen cloths, &c. This government is, however, distinguished for its commercial activity; and the capital of its merchants has been estimated at 17 million roubles. The trade centres mostly

in Tver, the cap., and is facilitated by the Vischnij-Volotschok Canal, which establishes a water communication between the Baltic and Caspian seas. The district of the government traversed by this canal is inhabited by a tribe of Carelians, and in the cap. is a German colony; but the pop. is mostly Russian, of the Greek church. This government is divided into 12 districts; chief towns, Tver, the cap., Torshok, Rjef and Bejetsk.

**TVER**, a town of European Russia, cap. of the above gov., on the Wolga, here crossed by a wooden bridge, 550 ft. in length, where it is joined by the Tvertza and Tmaka, and on the high road between Moscow and Petersburg; 90 m. N.W. the former; lat. 56° 51' 44" N., long. 35° 57' 36" E. Pop. in 1830, about 20,000. In respect of the regularity of its streets and buildings, Tver ranks next to the two Russian capitals; but wants their bustle and animation. It is divided by the several rivers into the town proper, suburbs, and citadel. The last, surrounded by a rampart of earth, comprises the governor's residence, an Imperial palace, the cathedral, and seminary; and its numerous towers and cupolas give it, at a distance, an imposing appearance. The cathedral is a square edifice, with a lofty spire, surmounted by a gilt copper dome, and surrounded, lower down, by four similar domes. The seminary, founded in 1727, for the instruction of 700 pupils in the sciences and ancient languages, is established in a convent built in the 13th century. There are numerous churches, government buildings, barracks, inns, a theatre, &c., and several public promenades, planted with trees. Tver owes its present regularity and beauty to a fire which almost totally destroyed it in 1763; after which the Empress Catherine ordered it to be rebuilt on a uniform plan. Some houses are of stone, but the greater part are of wood; and the paving is mostly of the same material. Captain Cochrane states that an impost is levied upon every horse that passes the gates, expressly to pave the streets. (*Mod. Trav.*, xvii. 114.)

Tver is a place of considerable trade, a large part of its pop. being merchants, or engaged in the navigation of the Wolga. It is an entrepôt for corn from the S. destined for Petersburg, and for goods conveyed overland to and from Riga. It is of considerable antiquity, having been the cap. of a principality as early as the middle of the 13th century. It has frequently suffered from the plague, and been taken by both the Tartars and Poles; but it has remained, with little interruption, attached to the dom. of the Russians since 1490. (*Schützler; Possart; Mod. Trav.*, &c.)

**TULA**, a government of European Russia, principally between the 53d and 55th degs. of N. lat., and the 36th and 39th of E. long., having N. the government of Moscow, E. that of Riazan, S. Orioff, and W. Kaluga. Length, about 130 m.; average breadth, about 85 m. Area estimated at 11,200 sq. m. Pop., in 1828, 1,113,500, this being one of the most populous of the Russian governments. It slopes generally to the N. and E., in which direction the Oka flows, forming its N.W. and N. boundary. The Don rises in this government. The surface is an undulating plain, and, though not very fertile, it produces a good deal of corn, with beans, turnips, mustard, flax, hemp, tobacco, potatoes, and other vegetables. The peasants, almost everywhere, have gardens in which they grow fruit, &c.; the climate being tolerably mild and healthy. In 1820, there were estimated to be about 300,000 head of cattle, 360,000 horses, and upwards of 1,000,000 sheep in Tula. Iron is abundant, and in the neighbourhood of the cap. iron mines extend over an area of 10 sq. m.; but the metal is of inferior quality, and iron is one of the chief imports into the government. A bad sort of coal has, also, been met with; but wood and charcoal continue to be the principal fuel used in the forges and other factories. Forests cover about 1,4th part of the surface. Dr. Lyall says that, S. of Tula, there is not so profuse a waste of timber in the construction of the peasants' houses as nearer Petersburg. Indeed, some of the houses are not built in the usual way with trunks of trees morticed together at the corners, but consist of wattled wickerwork. The dwellings, or rather the huts, of the peasants, which range along both sides of the road, are more paltry in their appearance, and more simple in their structure than those between the capitals. Indeed, they gradually become more miserable as we proceed S. till we come to regions where stone abounds. (*Trav.* i. 51-2.) Except in the capital there are hardly any manufacturing establishments other than tanneries, breweries, and distilleries, the last two being on a very extensive scale. The exports consist principally of corn, hemp, and flax, with cutlery, jewellery, hardware, &c., from Tula; the latter, with Bielef, being the chief seat of commerce. In this government is the canal of Ivanof, uniting the Oka with the Don, excavated by the Swedish prisoners in Russia early in the 18th century. Tula has been a separate government since 1796: it is divided into 12 districts; chief towns, Tula the cap., Bielef, Venef, and Odölef. Its inhabs. are nearly all Russians,

with some German colonists. In respect of public instruction, Tula is subordinate to the university of Moscow: in 1835, 1,476 children were attending the public schools. Public revenue in 1821, 9,312,172 roubles.

TULA, a town of European Russia, cap. of the above government, on both sides the Ussuri, 110 m. S. Moscow, lat. 54° 11' 25" N.; long. 37° 1' 34" E. Pop., including the government workmen, but exclusive of troops, about 35,000. (*Possart*, 527.) This town, the "Sheffield and Birmingham" of Russia, is one of the most interesting in the empire. Clarke says that, as seen from a distance, it has an imposing appearance. A very handsome church, with white columns, appears above the town, which occupies an extensive vale, and is filled with spires and domes. The entrances on both the N. and S. sides, are through triumphal arches, made of wood painted to imitate marble. (*Trav.* 1. 237.) It is divided into several quarters, the communication between them being kept up by a number of wooden and stone bridges; and there are several suburbs. There are 2 convents and 26 churches in Tula, all of stone; but the edifices which chiefly attract the stranger's attention, are the gun-manufactory, the gymnasium for the government; Alexander's school, opened in 1802 for the education of youth, at the expense of the nobility; the foundling hospital, a branch of that of Moscow; the house of correction, prison, arsenal, theatre, *gostinói* door, or building for the preservation and sale of merchandise, &c. The shops in the latter present more activity and industry than are usually met with in Russian towns, and some of the merchants are reputed rich. There is a continual mixture of wood and stone houses; but some streets are lined on both sides with stone edifices, many of which are massive and in good taste. (*Clarke's Lyall*, &c.)

The musket manufactory, though commenced at an earlier period, is indebted for its original importance to Peter the Great. It was remodelled and improved by Catherine II. in 1785; but its present excellence is mainly owing to Mr. Jones of Birmingham, invited into Russia in 1817. About 7,000 men and 9,600 women are employed in this factory, besides 3,500 hands in subsidiary occupations. About 70,000 muskets and 50,000 swords are said to be annually made here, exclusive of great numbers of carbines, pistols, bayonets, pikes, &c. The metal employed comes wholly from Siberia, and is of excellent quality. The workmen in the gun-factory enjoy peculiar immunities and privileges; they form a separate body, and have their judges selected from among themselves. They are divided into five trades: barrel-makers, lock-makers, stock-makers, furnishing-makers, and makers of small arms. The arms made at this factory have been ridiculously depreciated by some travellers, and as extravagantly extolled by others. The exploits of the Russian armies speedily shewed the entire worthlessness of the statements made by Clarke as to the badness of the Tula muskets; and, in point of fact, though they want the neatness and finish of the muskets of Birmingham, they are of very good quality. Some, also, of the fire arms and swords made here are very highly finished; but these are comparatively few. Among the other fabrics of Tula are mathematical and physical instruments, jewellery, and platinum wares, with silk and hat fabrics, tanneries, &c. The town is the residence of a military governor, with authority extending over the governments of Tula, Tambouf, Riazan, Orlof, Voroneje, and sometimes Kaluga.

Ancient Tula, which existed in the 12th century, did not occupy the site of the modern town, though it was on the Ussuri, at no great distance. The present city was founded in 1509, by Vassili-Ivanovich, who fortified it with a stone and brick wall, &c. Its defences, however, were insufficient to prevent its being frequently plundered by the Tartars, it being on the high road to Moscow from the Crimea. It has often suffered severely from fire; the last visitation being in 1834. (*Schmidler*; *Possart*; *Clarke's Trav.* 1.; *Lyall's Trav. in Russia*; *Modern Trav.* xv.)

TULLAMORE, an inland town of Ireland, prov. Leinster. King's co., of which it is now the cap., on the Tullamore river, affluents of the Binnia, and the left of the Grand Canal, in the centre of the Bog of Allen, 49 m. W. by S. Dublin. Pop. in 1831, 6,342. In consequence of its advantageous position on the Grand Canal, this town, which in 1790 was an obscure village, has risen to be the principal town of the co. The streets are wide and regular, and the shops and private dwellings are most respectable. In addition to the ordinary passage-boats between Dublin and Ballinasloe and Limerick, which all touch here, it has a daily communication with Dublin, by means of the swift iron boats lately established on the canal. Large quantities of corn and other articles of provision are shipped here for the metropolis. In consequence of its increasing size and importance, the assizes and other co. business were transferred thither in 1833, from Philipstown. The principal public buildings are the court-house and gaol, on the radiating plan, which stand contiguous, on a raised platform, at the W. end of the

town. It has also a par. church, a large Rom. Cath. chapel, a Quaker and two Methodist meeting-houses, some large public schools, a market-house, barracks, and infirmary. It is a constabulary station, has 3 breweries, and 2 distilleries; and large quantities of bricks are made in the vicinity. Markets on Tuesdays and Saturdays; fairs May 10., July 10., and Oct. 21. Post-office revenue in 1830, 646*l.*; in 1836, 688*l.* A branch of the Bank of Ireland was opened here in 1836. Adjoining the town is Charleville Forest, the seat of its noble proprietor, the Earl of Charleville, to whose liberality and munificence the town is greatly indebted. The pleasure-grounds are open to the inhabs.

TULLE, a town of France, dep. Correz, of which it is the cap., on the Correz, 72 m. S.W. Clermont. Pop. in 1836, ex. comm., 7,285; or inc. comm., 9,700. It stands partly on the steep declivities on either side the river, and partly on the narrow space of ground between. It is small, and its buildings are old and unprepossessing; but it has a pleasant promenade on the river's bank, good quays, many bridges, and a church in a semi-Gothic, semi-Carolingian style, a well-planned court of justice, some large buildings appropriated to a royal manufactory of fire-arms, carried on upon a very extensive scale, a well kept hospital, gendarmerie barracks, a departmental prison, college, seminary, theatre, and public library of 2,000 vols. Its inhabs. appear to have a decided taste for embellishment, and the town is expected thereby to manifest marked improvement in a few years. It has several mansions ornamented with Gothic and other sculptures, testifying the opulence of its ancient families. One house in particular, in the principal square, called the *Maison Sagr*, and dating from the 14th century, has its front decorated with arabesques of good taste, and of superior execution. The cemetery of Tulle is in a remarkable situation, on an isolated hill, commanding the town, on which also is a lofty square tower, supposed to have been built by the Romans, which has long served for a prison." (*Hugo*, and *Guide du Voyageur*.)

Tulle has tribunals of original jurisdiction and commerce, a school of geometry, &c., a society of agriculture, and manufactures of wax candles, oil, nails, and hardware, paper and leather; but it is a curious fact that though the linen fabric called *Tulle*, most probably derived its name from this town, it is no longer produced either here or in the neighbourhood. It has 12 fairs a year, one of which lasting the 3 first days of June, is a great mart for horses. The principal races within a circle of several days, are held near Tulle. This town is supposed to be not older than the 7th century; but about 3 m. northward are the ruins of Tintinac, probably the *Bathstium* of Ptolemy, exhibiting traces of a large amphitheatre, and of other extensive edifices. (*Hugo*, art. *Correz*; *Dict. Geog.*)

TUNBRIDGE, or TONBRIDGE, a market town and par. of England, co. Kent, lathe Aylesford, hund. Tunbridge, on the Medway, 27 m. S.E. London. Area of parish, 14,730 acres. Population, in 1831, 10,380. The town appears to have owed its origin to a strong fortress erected in the 11th century, of which the entrance gate, flanked by two round towers and part of the keep still remain. It consists principally of one long, wide, and prettily well built street, paved, lighted, and very clean. The public buildings include the church, grammar-school, town-hall, and market-house. Several bridges cross the Medway, which is here divided into different streams, the principal being erected in 1775, from a design by Mr. Milne, architect of Blackfriars-bridge, London. The living, a valuable rectory, in the gift of — Deacon, Esq., is worth 763*l.* a year, nett. There are several dissenting chapels. The grammar-school, founded in 1554, by Sir Andrew Judd, a native of the town is under the government of the Skinner's Company, and has one exhibition to either university, of 18*l.* out of 12*l.*, six of 10*l.*, and several to a less amount; besides which 366*l.* is paid for master's salary, &c., leaving a considerable annual surplus. At present there are about 45 scholars on the foundation. Holme's school at Southborough, at which 50 children are taught the rudiments of instruction, has an income of 108*l.* a year; and there are several minor establishments for education, besides various other endowments for the benefit of the poor, amounting altogether to upwards of 84*l.* a year. (*Parl. Reps.*) It has a market on Friday, and four annual fairs. The grammar-school has had some very distinguished masters, among whom may be specified the learned Vicesimus Knox, D.D., author of *Moral and Literary Essays*, a treatise on *Liberal Education*, and various other popular and exceedingly useful works. Dr. Knox succeeded his father as master of the school in 1778; and having held the situation for 33 years, or till 1812, he was in his turn, succeeded by his son. The doctor died at Tunbridge in 1821.

The rocks, watering-place, Tunbridge Wells, is partly in this par. and partly in those of Speldhurst and Hynt in Sussex, being about 5 m. S. Tunbridge. It con-

states of several different divisions, as Mounts Ephraim, Sion, and Pleasant, and the Wells, the pump and assembly-rooms, public parades, chapel of King Charles the Martyr, &c. in the latter. The springs, which were first discovered in the reign of James I., soon attracted the notice of the fashionable world. Henrietta Maria, queen of Charles I., paid a visit to the wells; but there being at that period no houses nearer than Tunbridge, and those not particularly suitable for such a guest, her majesty, and her suite lodged in tents pitched on Bishop's Down I. The wells were also visited by Catherine, queen of Charles II., Queen Anne, and other distinguished personages. The water is a chalybeate, with an excess of carbonic acid gas, very similar to that of the *Pouhon* spring at Spa in Belgium. Tunbridge Wells resembles Spa in some other particulars; as in its manufactures, toys, boxes, and turned wares being made here in great variety, and also in its being much less frequented now than formerly by the leaders of the *haut ton*. The season for taking the waters continues from May to November. There are races in August, which are tolerably well attended. The chapel of Tunbridge is situated at the junction of the three parishes of Speldhurst, Tunbridge, and Frant, and is partly in each. The air of this district is pure and salubrious, and is, perhaps, little less efficacious than the waters in removing complaints.

TUNIS (an. *Zugitania* and *Bizacium*, the E. portion of the *Africa* of P. Mela, with part of *Gætulia*), a kingdom or regency of N. Africa, a nominal dependency of the Turkish empire, principally between the 33d and 37th degs. of N. lat., and the 9th and 11th of E. long.; having S.E. the regency of Tripoli, N.W. that of Algiers, S. and W. the desert, and N. and E. the Mediterranean. Length N. to S. about 400 m. Its area has been roughly calculated at 72,000 sq. m. The pop. has been very variously estimated; but, perhaps, it may be taken at about 2 or 2½ millions, of whom probably from 7,000 to 10,000 may be Turks, about the same number Christians, 112,000 renegades, 100,000 Jews, and the remainder Arabs, Moors, and Berbers, the Arabs being the most numerous. This territory is traversed by several branches of the chain of Atlas, one of which separates it from the *Bilad-el-Jerid*, or "country of dates." The S. part of the regency is mostly a sandy waste, and some other parts are desert; but many tracts are of the highest fertility, particularly those watered by the Mejerdah. This river, the *Bagrada* of the ancients, is formed by the union of two streams, on the W. frontier of Tunis, and runs thenceforward generally N.E., entering the Mediterranean about lat. 37° N., long. 16° E., a few m. S. of the site of Carthage. According to Shaw, it is "equal to the Isis united with the Charwell." Flowing through a rich and fertile country, it becomes highly impregnated with soil:—

"Turhidus arentes lento pede sulcat arenas  
Bagrada." *Silius Ital.* l. vi. 140.

The Mejerdah receives no large tributary, nor is there any other considerable river in the regency. In the S., about 40 m. inland, is the Sibbah, a remarkable tract 70 m. in length N.E. to S.W., portions of which formed the *Pulus Lybie*, *P. Tritonis*, &c., of antiquity. In winter, it is covered with water to the depth of 2 or 3 ft., but at other times it is a dry plain, the surface being entirely covered with a salt incrustation. Sir G. Temple, who, in the dry season, spent seven hours in crossing the Sibbah, says that, on approaching it, "the grass and bushes become gradually scarcer; then follows a tract of sand, which, some way beyond, is in parts covered with a very thin layer of salt; this, as you advance, becomes thicker and more united; then we find it in a compact or unbroken mass or sheet, which can, however, be penetrated with a sword or other sharp instrument, and here I found it to be 11 inches in depth; and finally, in the centre, it becomes so hard, deep, and concentrated, as to baffle all attempts at breaking its surface, except with a pickaxe. The salt is considerably weaker than that of the sea, and is not adapted to preserving provisions, though its flavour is very agreeable." (li. 160–163.) About the centre of the lake are the foundations of a circular tower, where caravans halt to feed their camels; and in several parts are elevated plateaus, forming islands in the rainy season, the largest of which, covered with a luxuriant vegetation of date palms, is the *Pha* of Herodotus. The Arabs have a tradition that this lake once communicated with the sea by means of a river, but no traces of such communication appear to exist at present. There are no other inland lakes of consequence, but several considerable arms of the sea, as the Gulf of Biserta (an. *Sinus Ipponensis*), the Lake of Tunis, &c. The coasts of Tunis are greatly indented by bays, those of Tunis, Hamamet, and the Gulf of Gabes, or *Lesser Syrtis*, being the principal. The principal promontories and headlands are the Dakhul, a long tongue of land terminating in Cape Bon (an. *Prom. Mercurii*), the scene of several events in the 5th book of the *Æneid*; Capes Serra, Ras-el-abiad, or the white promontory (an. *P. Caulidum*), Ras-Zibeeb (an. *P. Apollinis*), &c. The

shores in the N. are frequently bold, but in the S. they are low and sandy.

The *geology* of this country has been little or not at all studied; nor have its mineral resources been turned to profit for many ages. Copper and lead were among the exports of the Carthaginians; and these metals, with silver, are still to be found in the mountains: there is also a quicksilver mine near Porto Farina, but mining is altogether neglected. The *climate* appears to be less hot than might have been supposed. Sir G. Temple says, the average heat in Aug. and Sept. at Tunis is 82° F. ah.; and in the year of his visit the thermometer seldom rose to 90°, and never exceeded that limit. From the 19th Dec. 1832 to the 19th Jan. 1833, it averaged 55½°; the highest range during that period being 60°, and the lowest 52°. Rainy weather commences about the end of Oct., and continues, at intervals, till May. As early as Jan. the surface is covered with fresh verdure; and, on the whole, the climate may be said to be healthy as well as pleasant. It is true that the plague is not unfrequent, and that its ravages have been supposed to be a principal cause of the depopulation that is admitted to have taken place during the last half century. But this is to be ascribed more to the slothfulness of the inhabs., and the want of precautions, than to any thing unfavourable in the climate.

The *vegetation* is, for the most part, the same as in the adjacent regency of Algiers, and on the opposite shores of Sicily and S. Italy; the olive, pistachio, carob, with dates, melons, the lotus, &c., are common products. This region was, in antiquity, celebrated for its extraordinary fertility. It exported large quantities of corn to Rome, of which it was one of the granaries. Pliny, in speaking of the extraordinary productiveness of the soil, assures us that a plant of wheat (*triticeum*), sent from it to Augustus, had little short of 400 stalks; and another, sent to Nero, had 340. In antiquity, indeed, the common opinion was, that in this favoured region the labour of the husbandman was rewarded by the enormous increase of 100-fold! Hence, says *Silius Italicus*:—

"—scu sunt Byzacea cordi  
Rura magis, centum Cereri fructantia culmis." *Lib. ix. lin. 201.*

And it would still seem to be endowed with the same wonderful productiveness. Sir G. Temple says, that "whilst halting in a field of young barley to feed our horses with its tempting crop, I counted on one plant 97 shoots or stalks; and this was not selected by me as being the largest, but as the nearest to where I was sitting." (*Excursions*, li. 168.) In fact, there cannot be so much as the shadow of a doubt, that were Tunis subject to an intelligent government, it would, at no distant period, furnish large quantities of corn for exportation. At present, indeed, such is the undiminished fertility of the soil, that a surplus is raised for exportation notwithstanding the oppression and extortion to which the husbandman must submit. The government assessor goes into a field while the crop is in ear, and values it according to his caprice; taking care, however, to be always above, and never below the mark. The owner is then obliged to pay a tithe on this supposed value of his future crop; though, when harvest time has arrived, he finds, perhaps, that it does not exceed 1-4th part of the sum at which it was estimated! The same is the case with olives, the principal resource of the country; and these, moreover, are not allowed to be gathered till an order to that effect has been received; and in consequence of the great delay which often takes place in sending it, the fruit frequently falls and rots on the ground, the owner not being permitted to pick it up; he is also obliged to send his olives, when they have finally been collected, to mills established by the bey, who derives therefrom a considerable profit. (*Temple*, i. 225, 226.) We need not, therefore, be surprised that agriculture should be almost wholly neglected and abandoned, no one venturing to cultivate more ground than is sufficient to supply his immediate wants, and to furnish the taxes to government. Wheat, barley, sorgho, maize, and millet are the grains principally raised; in the S., the date tree supplies the Arabs, not only with their principal nutriment, but also, with their fuel. Cotton and indigo have been introduced into the culture somewhat recently; and some parts of the culture somewhat recently, &c. are grown; and tobacco is pretty general. The sugar cane succeeds well, but no sugar is made. All the fruits of S. Europe, as pomegranates, oranges and lemons, figs, jujubes, &c., and the vines on the N. coast yield excellent raisins, most of which are dried for exportation; but apples and pears degenerate. Among other products of importance is hennah (*Alhennah Arabum*), so much used "as a dye for ladies' hands and horses' legs," and which is a chief article of trade at Gabes. This plant, where not annually cut, and kept low, grows to 10 or 12 ft. in height, putting out clusters of small flowers, having an odour of camphor. (*Shaw*, 114.) The dye is a bright orange, or lawn saffron.

The leaves are picked twice a year, dried and powdered, and in this state sold in all the markets of the E. The powder, formed into a paste, is applied to the part required, and then bandaged round. The plant is cut level with the ground as soon as the leaves have been picked. The bennah, like the date palm, requires to be frequently watered, for which purpose the plantations are divided into squares, and enclosed by banks; a stream is then admitted into them, and allowed to flow for a certain time every week, generally an hour a day, and two hours during the night, each square being watered in turn. The expenses of watering are defrayed by the various occupants, in proportion to their number of squares. (*Semple; Shaw*.) This system of irrigation is noticed by Pliny. (1. lib. xviii. cap. 22.)

Horses, mules, camels, and oxen are used for field labour, and, with sheep, are the principal domestic animals. The breed of horses has deteriorated, in consequence of the government seizing for its use those that are most valuable. The cattle are small, but good, and many are sent to Malta. Some of the sheep are very fine, and all have the large fat tail which characterises the African breeds. The Merino breed is said to have been originally introduced into Spain from Barbary. (*Temple*, i. 227.) The lion, panther, jackal, wild boar, jerboa, genet, &c., are among the wild animals. Most of our readers are, no doubt, aware, that the banks of the Bagrada are celebrated in history for the stubborn resistance which an enormous serpent (120 ft. in length), found on its banks, is said to have opposed to the progress of the Roman army under Regulus i. (*Lin. Epit.*, lib. xviii.; *Aulus Gellius*, lib. vii. cap. 3.) But it is now generally acknowledged that many apocryphal statements have been mixed up with the history and fate of Regulus; and the *prelium grande atque arce* with the serpent does not certainly seem to be the most authentic part of the story. At all events, this gigantic brood of reptiles has now luckily disappeared; and Sir G. Temple says that the largest of those existing never exceed 12 ft. in length. The locusts, which often visit the country in clouds, eating up "every green thing," are incomparably more destructive than the reptiles. Large quantities of fine coral are found round the coasts, which are visited in consequence by Sicilian and Neapolitan fishermen.

*Manufactures* are few: they comprise some silk, linen, and woollen fabrics, leather, &c.; but the principal are soap and the *beretti*, or red caps of Tunis, so well known throughout the Mediterranean. The principal soap-works are at Suse. The soap is of good quality, and the soft especially is much esteemed. Little is prepared on a speculative anticipation of a demand for exportation, but any quantity may be had by contracting for it a few months beforehand. The manufacture of skull-caps is said to have employed formerly more than 50,000 persons, and 3,000 bales of Spanish wool were annually used. (*Macgill, in Mod. Trav.*) At present it is reduced to one third of this extent; spurious imitations of the Tunis caps having been made in Marseilles and Leghorn. The dye employed for the caps is the kermes chibdy; the process of dyeing is conducted mostly at Zaghlwan, an inland town, the water of which gives great brilliancy and permanence to the colour. Previously to their being dyed, the caps are boiled for a whole day in alum-water. The woollen cloth made in the regency, principally at Jerba, is thin, resembling soft serge. Morocco leather is made in considerable quantities, and dyed skins are articles of extensive export. Though cochineal is used in dyeing, and the prickly pear grows most luxuriantly in Tunis, no attempts have yet been made to introduce the insect into the country.

*Trade*.—None of the Barbary states is so well situated as Tunis for an extensive commerce, particularly with Europe. Three caravans come annually from the interior of Africa, bringing slaves, senna, ostrich feathers, gold-dust, gum, ivory, &c.; and take back woollen cloths, muslin, linen and silk fabrics, red leather, spices, fire-arms, gunpowder, &c. Other caravans come from Constantinople with virgin wax, dried skins, cattle, and sheep, which they exchange for cloth, muslin, Tunis mantles, linen, raw and manufactured silks, colonial produce, essences, &c. According to a statement by the French consul, the value of the different articles of export from Tunis may be estimated as under:—

	France.
Oil	4,140,531
Grain and pulse	279,437
Pistachios and dates	87,250
Wool	1,196,651
Cattle	97,101
Sponges	210,504
Senna	60,017
Wax	40,140
Hides	210,770
Tunny fish	400,000
Gold-dust and elephants' teeth	221,457
Red caps	1,881,451
Soap	57,090
Hornshoes, shawls, blankets, and various other articles	521,060
Total	9,406,436

The imports are woollen goods, from France and England; cottons and llinens, from the latter and Germany; with coffee, spices, sugar, tin, lead, and iron, silk, wool, wine, &c. The government monopolises the trade in many articles; as tobacco, wax, wool, and provisions, which it farms out to various individuals.

The *Government* is in the hands of a *bey*, who rules with despotic power; he receives the *caftan*, but is the dignity of a pacha of three tails, from the sultan, but is not otherwise in any way dependent on Turkey. The *divan* is composed of 37 *mems*, each of whom has a vote in council; but this body has only a nominal authority. The revenues of the *bey* have been estimated at 24,000,000 piastres, or upwards of 1,500,000*l.* a year; though at present that derived from regular sources is supposed not to exceed one fourth part of this sum. Its principal sources are the customs, which are farmed *every year* to the highest bidder; the tithes upon the cultivation of olives, corn, and other products; the sale of permits for the exportation of necessaries and the importation of wines and spirits, usury taxes, the *bey's* domains, the sale of government offices, a poll-tax on the Jews, the traffic in slaves, and private mercantile speculations of the *bey*, occasional extortions from the wealthy, and the property of those who die without heirs, of which the exchequer takes forcible possession.

The armed force consisted, in 1832, of nearly 50,000 men; but of these 40,000 composed the contingents (chiefly cavalry) furnished by the different Arab tribes, and the standing army consisted of only about 6,000 men. The regular infantry, a body of 2,000 men, were originally organised by a French officer in 1831. There are 3,000 Turkish infantry, 2,000 spahis, or paid cavalry, 300 Mamelukes, forming a body-guard, and 16 pieces of artillery. The naval force now consists of only a corvette, a few brigs and schooners, and about 30 gun-boats; and Tunis is no longer formidable for piratical expeditions. By a treaty with France in 1830, piracy and Christian slavery were wholly abolished.

The people, their manners, customs, &c., are similar to those of Algiers, to which we beg to refer the reader. The Tunisians may, however, claim to be considered the most civilised and tolerant nation in Barbary, though in negotiations with them, as well as the neighbouring powers of N. Africa, Sir G. Temple thinks an attitude of firmness, and not of conciliation, should be adopted, the latter being always supposed to indicate fear and weakness.

This region, which in antiquity was the centre of the Carthaginian dominions, remained in the possession of the Romans from the destruction of Carthage to the beginning of the fifth century, when the Vandals settled themselves in Africa. In 690 it became subject to the caliphs, and, after belonging to several successive dynasties, was conquered by Barbarossa in 1534. The emperor Charles V., in 1537, took Tunis, and restored the dethroned Muley Hassan; but in 1570 the country was taken anew by the Turks, and it has only regained independence by the gradual decline of their empire. (*See Shaw's Travels in Barbary; Temple's Excursions in the Mediterranean*, 2 vols.; *Mod. Trav.* xx.; *Private Information*.)

TUNIS (an. *Tunes*), a marit. city of N. Africa, cap. of the above regency, on the W. side of the Gulf of Tunis, being separated from it by a large salt-water lake or lagoon, about 4 m. W. from the sea, and 3 m. S. W. from the ruins of the ancient Carthage; lat. 36° 47' 59" N., long. 10° 11' E. Its pop., which is greater, perhaps, than that of any other African city, Cairo excepted, has been estimated at from 100,000 to 150,000, of whom, perhaps, 30,000 are Jews and 2,000 Christians. It stands on the edge of the lagoon, upon rising ground, backed on the W. by heights, which are crowned by the *kashah*, or citadel. The town is inclosed by a wall of earth and stone, and a second wall surrounds its 3 suburbs, the outer wall being about 5 m. in circ. Towards the N. it is defended by 2 castles, and other heights around it on the S. and E. are protected by detached forts; but notwithstanding the suns laid out on its defence, it is not a well fortified or strong town, and has been repeatedly taken. The houses, though of stone, are mean and poor, and the streets narrow, unpaved, and filthy; the bazaars, which are superior to those of Algiers, are vaulted overhead, and sometimes furnished with footways. There are a great number of mosques, several of which are handsome, and one was converted into a Catholic cathedral during the Spanish occupation. The palace built by the late bey, in which Queen Caroline lodged during her visit to Tunis, is a square edifice, magnificently decorated within. The rooms are paved with marble, and all open upon marble courts, with fountains in their centre. For about 10 ft. from the floor the walls of the rooms are lined with glazed tiles, and above this with stucco-work peculiar to the Moors; while the ceilings are traced in different-coloured patterns, with much taste. The great hall of justice has never been finished. In different parts of the city are five

large barracks, also built by the late bey; and a very extensive edifice of the same description, fitted to accommodate 4,000 men, was, a few years since, in the course of being built. (*Temple*, l. 175.) In digging the foundations of this edifice, two sarcophagi were found, and an ancient cistern of great extent, and in good preservation. The citadel, though large, is in a ruinous state, having but one efficient battery; in it is a gunpowder factory. Tunis has many gates, one of which, called the *Bab Kartajinah*, or Carthage-gate, has in its vicinity the Protestant burial ground. It has also a Rom. Cath. convent, church and chapel, a Greek church, an English consulate, and a theatre at which Italian operas and comedies are performed 3 or 4 times a week. About 14 m. W. from the city is the Bardo, or summer palace of the bey. It resembles a little fortified town, with its ramparts, bastions, &c., and has a pop. of at least 4,000 persons, employed in some way or other about the court.

The Gulf of Tunis opens to the N., in the form of a horseshoe; it is 16 m. deep, and has good anchorage all over in from 4 to 10 fathoms water. The N. and N.E. gales sometimes throw in a heavy sea, which however seldom occasions any damage. The port is at the Goletta, or channel, passing through the narrow belt of land separating the lagoon of Tunis from the sea. There is at all times about 15 ft. water in the canal, and ships may use it on paying a fee of 3 dollars a day. It is not, however, much resorted to, all vessels of considerable burden loading and unloading from their moorings in the bay, by means of lighters. The Goletta is pretty strongly fortified, though commanded by a hill to the N. A harbour light, 40 ft. in height, was erected at the entrance to the canal in 1819. A great number of boats are employed in conveying goods and passengers across the lagoon between the port and the city.

The lagoon of Tunis was formerly, as Procopius states, a deep port, with water sufficient to float large ships. But now, from its being the receptacle of the fifth conveyed to it by the common sewers of the city, and other causes, its greatest depth does not exceed 5 or 7 ft.; while round the shores it is comparatively shallow. An island in its centre, opposite the city, is defended by a fort. It does not receive any rivulet, and its loss by evaporation is supplied by a current which sets into it through the Goletta.

The average annual value of the exports from the regency of Tunis from 1830 to 1837 has been estimated at 7,527,000 piastres, and that of the imports at about 124 millions do. Subjoined is an

ACCOUNT of the Value of the Exports and Imports of Tunis in 1837, specifying the Value of those sent to each Country:—

Countries.	Exports. Value in Piastres.	Imports. Value in Piastres.
France	2,138,971	1,819,229
Algiers and Bona	397,782	80,355
Great Britain	656,174	1,229,805
Austria	21,969	120,705
Sardinia	92,248	613,118
Tuscany	705,865	4,289,410
Turkey	1,170,980	1,161,193
Barbary States	66,830	85,115
Greece	4,909,000	582,170
Naples and Sicily	79,994	161,865
U. S. of America	95,419	-
Spain	-	112,550
Total	7,913,426	10,592,407
Equal to	L. 259,180	L. 340,110

But this, though it be the most considerable native trade of any city on the Barbary coast, is certainly not a tenth part of what it would amount to were the country subjected to an intelligent government, and its gigantic resources properly developed. Naval and military stores imported into Tunis pay no duty; other articles pay 3 per cent *ad valorem* on a rated tariff. Accounts are kept in piastres (worth about 1s. 1d.) of 16 carobas, or 52 aspers each. The Tunis lb. of 16 oz. = 7,773 grs.; the principal commercial weight is the cantaro of 100 lb. = 111 lb. avoird. The *cafiz*, for corn, = 144 pic. bushels; the *matlar*, for oil, = about 5 galls. The *pic* varies from 18 to 25 in.

According to Strabo, *Tunee* existed before the foundation of Carthage. The chief events in its history are its numerous sieges and captures. Louis IX. of France died before its walls in 1270; and it was taken by the Emperor Charles V., who defeated Barbarossa under its walls, in 1535. On this occasion about 20,000 Christian slaves were freed from bondage; but, unfortunately, 30,000 Moslem inhab. of the city were, at the same time, put to the sword, despite the efforts of the emperor to prevent it, by the victorious troops, while 10,000 more were carried away, and sold as slaves. (*Robertson's Charles V.*, li. 375. 4to ed.; *Sauv's Travels*; *Temple's dict.* *Comm. Dict.*; and *private information*.)

TURCOING, or TOURCOING, a town of France, dep. du Nord, cap. two cantons, immediately adjoining

the Belgian frontier, 10 m. N.E. Lille. Pop., in 1836, 8,749. It is regularly laid out, and pretty well built; the town hall in the great square, two churches, a college, a charitable asylum, and the remains of an old feudal castle, are its most conspicuous objects. The inhabs. share in the manufactures common to Lisle and Roubaix, and their condition has been noticed in the article on the latter (*ante*, p. 603—604.). "Tourcoing has fewer looms than Roubaix; the articles woven are chiefly coarse cotton goods and linens. The weavers gain 9 or 10 francs gross per week; the other working classes (adult males) get from 1½ to 2½ fr. a day. The weavers are the most moral class in the town; they attend to the education of their children, and seem contented with their condition." (*Symons in Hand-Loom Weavers' Report*.)

TURIN (Ital. *Torino*, an. *Augusta Taurinorum*), a city of N. Italy, the cap. of the Sardinian dominions, prov. of same name, in Piedmont, near the Po, where it is joined by the Dora, 80 m. W.S.W. Milan. Lat. 45° 45' N.; lon. 7° 40' 18" E. Civil pop. in 1838, of the city 122,463; with suburbs included, 161,078; and including the canton, or immediately adjacent territory, the garrison, 123,892. The city is of an oval shape, and about 4 m. in circuit; it was formerly fortified, but is now an open town, standing in a rich, well watered, and well cultivated plain; it is approached by four fine roads shaded with forest trees; the surrounding hills being covered with handsome edifices, among which the church of La Superga is pre-eminent. The impressions which Turin produces on the traveller are very much governed by the circumstance of its being the *first* or the *last* city he visits in his progress through Italy. Mr. Woods, who had already seen the best productions of architecture, states that being built on a flat, Turin makes no show at a distance; the domes and towers are neither numerous nor lofty, and on looking down on the city from the neighbouring hills, the dingy red of the roofs have a disagreeable appearance. (*Lectures of an Architect*, li. 122.) But Forsyth, a severe as well as an excellent judge, says that Turin is admired for the regularity of its plan, the cleanliness of its streets, the symmetry of its squares, the splendour of its hotels, and the general elegance of its houses; and Simond adds, "Turin forms a perfect contrast with all the cities we have been accustomed to see in Italy: it is new, fresh, and regular, instead of antique and in decay; and the buildings, all alike, are collectively magnificent if not quite so in detail, the materials being only brick coated over in imitation of stone. A profusion of running water keeps the fine wide pavement clean. All round the town, ancient trees of luxuriant growth oppose their impenetrable shade to the intolerable heat of the sun, and the views of the Alps are magnificent." (*Trav.* p. 606.) On the whole it may be truly said, that, were it not for the taste far more pretentious now and which is offensively prevalent every where in Turin, it would be one of the very finest cities of Europe. It has indeed comparatively few modern works of art, and little to interest the antiquary; and there is scarcely any thing to characterise it as an Italian city: to most travellers it has appeared rather like a new and handsome French town.

Except in the old town, which forms about one sixth part of the whole, the streets, which are bordered by houses four or five stories high, are straight and cross each other at right angles; and here, as in the new town of Edinburgh, and the N.W. and other parts of London, entire rows and streets of considerable extent are of precisely similar architecture. The royal palace stands in the centre of the town, in the *Piazza Reale* or *di Castello*, a very large and elegant square, surrounded by many other public buildings, and having in its centre the former palace of the Dukes of Savoy, a castellated mansion encircled by a moat. The *Strada del Po*, a noble street 4 m. in length, leads to the great square from the river, which is here crossed by a fine stone bridge of five arches, erected by the French; but which is said to be surpassed by a new bridge over the Dora recently completed. The *Strada di Po*, like the *Strada Nuova* and *di Dora Grande*, the *Piazza Reale*, *S. Carlo*, &c., is embellished in its whole length with arcades over the footways, which give a most agreeable and imposing appearance to these parts of the city. The royal palace is little remarkable in its architecture, but it has some spacious and richly adorned apartments, and a good collection of paintings, including many of the Flemish school, and others by Titian, Correggio, Albani, Murillo, &c. In this edifice is the equestrian statue of Amadeus I., the figure in bronze, the horse in marble. Attached to the palace are gardens open to the public, the fashionable resort during day; the *Rondo* between the city and the Po, and Valentino in the evening. The grounds, being the favourite resort of the nobles, the old palace of the Dukes of Savoy is a singular building with four fronts of different architecture. According to Forsyth "three of these are hideous in themselves, and derive comparative ugliness from the beauty of the fourth. This last front, composed of one Corinthian peristyle

raised on a plain basement, is the noblest elevation in Turin, where it holds the post of honour." (P. 418.) The private palaces would strike a stranger who had just crossed the Alps as very magnificent, but there are many in Italy equally large and in a much purer taste. That of Prince Carignano has a remarkable staircase by Guarini, who, along with Guivarra, has been the architect of most of the principal edifices in Turin.

The cathedral, a Gothic structure built about the end of the 15th century, has been praised for the richness of its appearance, particularly the W. front, which is ornamented with well executed bas-reliefs, &c. In it is the chapel of the *Santo Spirito*, in which the winding-sheet of our Saviour is preserved with all the attention due to so important and so authentic a relic. This cathedral was formerly among the wealthiest churches in Italy; but its plate has been sold, and the produce applied for the most part to secular, indeed, but certainly quite as useful, purposes as those to which it had been previously appropriated. In fact, the useless riches of this cathedral, its images, vases, candlesticks, &c., defrayed the cost of erecting the bridge across the Po in this city, and embanking that river, as well as of improving the Tuileries, and building the Rue de Rivoli in the French capital. (*Condor's Italy*, i. 159.)

The churches of *San Filippo*, *San Christina*, and many others, are richly adorned; but they all yield the palm to *La Superga*, situated on a hill about 5 m. from Turin. It was on this spot that the Duke of Savoy (Victor Amadeus) and Prince Eugene met to concert their plans for the attack of the French, and the deliverance of the city in 1706; and the church was constructed by the duke as a monument of his gratitude to the God of battles for having given a signal victory to his arms. The edifice is not unworthy its origin. It is of a circular form, and surmounted by a dome. Eustace says, "All the columns in this building are of marble of different colours, and give the edifice an appearance unusually rich and stately. Instead of pictures, the altars are decorated with bas-reliefs: the pavement is of variegated marble: in short, all the different parts of the building, and even the details of execution, are on a scale of magnificence." (*Class. Tour*, iv. 100.) It must be admitted, however, that the building has some considerable defects, which have been pointed out by Mr. Woods.

The university of Turin was founded in 1405. It consists of 5 faculties, or colleges, consisting of theology, with 4 professors; law, with 5 do.; medicine, with 6 do.; surgery, with 5 do.; and the arts, with 22. It is usually attended by about 1,200 students, who board out in private families. (*Journ. of Educ.* xvi.; *Simond*, &c.) Its library is said by Rampondi to have 60,000, and by Valéry 112,000 vols. Its buildings are extensive and well arranged; the court is surrounded with a double tier of porticoes, under which is a collection of ancient sculptures, bas-reliefs, &c., from the excavated Roman city of *Industria*, about 18 m. distant. In the museum of the Academy of Sciences is the valuable collection of Egyptian antiquities, formed by Drovetti, and purchased by the King of Sardinia for 400,000 fr. It comprises several colossal statues of Egyptian sovereigns, domestic and agricultural implements, MSS. and papyri, the famous Isiac table, &c. Under the same roof are museums of natural history, anatomy, and medals; and the royal library, comprising an extensive and valuable collection of historical and other works, including an extensive series of Bibles.

The citadel of Turin is a regular pentagon, planned by Urbino in the 16th century: it has extensive subterraneous galleries, and is still of considerable strength. The gates of the city, which were cased with marble, were demolished by the French, and the ramparts dismantled and converted into public walks. But, to use the words of Rampondi, *con tale distruzione divenne una città tutta nuova e d'un aspetto delizioso*. The Valentino palace, and the other royal seats around the city, are now either deserted or appropriated to schools and museums; these, with 9 hospitals, 2 asylums, the colleges of the Jesuits and Ignorantini, an arsenal, with a school of military engineering, a grand opera-house, ranking as the 3d theatre in Italy; 2 smaller theatres, the cemetery of the aristocracy, observatory, botanic garden, royal academy of painting, and *monie di pietà*, comprise most part of the other establishments worth notice. Turin is the residence of the king and seat of the royal senate, or superior court for the kingdom, and of a tribunal of primary jurisdiction, an archbishop's see, and has chambers of agriculture and commerce. Its manufactures consist chiefly of silk, fabrics and twist; but it has others of woollen and cotton goods, hardware, arms, paper, glass, earthenware, liquors, &c.; and its printing business is pretty extensive. The shops and hotels of the city are good, but the supply of water is bad, and the prevalence of fogs render it rather an unpleasant residence in autumn and winter. The manners, habits, language, &c., of the inhabitants are more French than Italian.

Turin was made a military station by Julius Cesar on his invasion of Gaul. In 312 Constantine gained in its vicinity a great victory over Maxentius. Charlemagne annexed this city to the Marq. of Susa; it came into the possession of the Dukes of Savoy in 1032; and became their cap. in 1281. (*Rampoldi*.) It was taken by Francis I. in 1536, and held for 26 years by the French, who again took it in 1640. But the most celebrated by far of the sieges of Turin took place in 1706, when it was invested by a powerful French army. Voltaire has described the immense preparations made for this siege (*Sicèle de Louis XIV.*, cap. 20.); but the incapacity and disagreement of the French generals, and the talents of Prince Eugene and the Duke of Savoy, secured for the latter an easy and complete victory. All the vast stores accumulated by the French fell into the hands of the conquerors, and the besieging army was wholly dispersed. Under the French ascendancy, from 1800 to 1814, Turin was the cap. of the dep. of the Po. (*Rampoldi*; *Eustace*, iv. 89–102.; *Forsyth*; *Woods*, ii. 422–6.; *Rose's Letters from the N. of Italy*; *Condor's Italy*, i. 156–173, &c.)

TURKEY, or the OTTOMAN EMPIRE, a very extensive country, partly in S.E. Europe, and partly in W. Asia, comprising some of the most celebrated, best situated, and naturally finest provinces of the continents to which they belong. The limits of the Turkish empire are not easily defined; inasmuch as it is usually represented as including several extensive countries, that are either substantially or virtually independent. Moldavia, Wallachia, and Servia, in European Turkey, are now connected with the Porte only by the slenderest ties; though, as some of their fortresses are garrisoned by Ottoman troops, and as they continue to pay tribute to the Porte, they may still, perhaps, be properly included within the wide range of the Turkish dominions. Egypt, however, and the other African territories that formerly belonged to the Porte, may now be considered completely dismembered; and, but for the interference of England and the other European powers, Syria and Palestine would have been annexed to the dominions of the pacha of Egypt.

European Turkey, including Wallachia, Moldavia, and Servia, comprises, with the exception of the new kingdom of Greece, almost the whole of the most easterly of the three great peninsulas of S. Europe, extending from 30 to 48° deg. N. lat., and from 15° to 29° deg. E. long. It is bounded on the N. by the Austrian empire, from which it is separated by the Save, the Danube, and the E. Carpathian mountains; on the N.E. it is separated from the Russian prov. of Bessarabia by the Pruth; on the E. it has the Black Sea, the Bosphorus, the Sea of Marmora, and the Hellespont; on the S. Greece; and on the W. the Mediterranean, the Adriatic, and the Austrian prov. of Dalmatia.

Very different estimates have been formed of the extent and pop. of this vast country, and neither is known with any thing approaching to precision. Perhaps, however, we shall not be far wrong if we estimate its extent at 210,000 sq. m., and its pop. at from 14,000,000 to 15,000,000.

The Turkish dominions in Asia are of still greater extent than those in Europe, but their pop. is much less considerable. They embrace the whole peninsula of Asia Minor and the adjacent islands, the greater part of Armenia and Koordistan, with Syria and Palestine, Mesopotamia, and a portion of Arabia. In all, they may comprise an area of about 437,000 sq. m., with a pop., probably, of about 10,000,000.

*Physical Geography.*—Principally includes the mountains of Turkey in Europe in the Alpine system. But, according to other authorities, there are several different mountain systems in Turkey, having little connection with each other; and Boue states that most maps of the country err greatly in their representations of the direction, position, and height of the mountain chains. The high table-land anciently called *Mesia Superior*, extending between Sophia and Pristina, and dividing the basin of the Morava on the N. from those of the Vardar, Struna, &c. on the S., and of the Lower Danube on the E., forms the central nucleus of the Turkish mountains. From this centre branches pass off northward, bounding Servia on the W. and E.; on the E. the Balkan chain (an. *Hemus*) stretches in a nearly straight line from the sources of the Isker to the S. of Sophia, E. to the Black Sea, a distance about 250 m.; dividing Bulgaria from Roumelia, and the waters that flow into the Lower Danube on the N. from those that flow into the Maritza on the S. The Despot-Dagh (anc. *Rhodope*), and the mountain chains that run through Macedonia, branch off from the central nucleus on the S.; while on the W. it gives off various chains that unite with the true Alpine chains, which run through Croatia, Bosnia, Herzegovina, Montenegro, and Albania. Nearly in a direct line S. from Pristina runs a chain which divides Albania from Macedonia, and thence extending into Thessaly and Greece under the name of Iindus, separates the waters flowing into the *Ægean* from those flowing into the

Adriatic and Ionian Seas. The interposition of these mountain chains frequently renders the communication between contiguous provinces rare and difficult. But with the exception of a few heights, as Mount Scardus, nearly 10,000 ft. in elevation, and Scomius and Pindus, near Mezzovo (about 9,000 ft.), the Turkish mountains seldom reach an altitude of 8,000 ft. Mount Dinar, whence the Dinaric Alps derive their name, is only 7,458 ft. in height; the Albanian mountains are generally under 7,700 ft.; Mount Athos is 6,778 ft., and Mount Menikon (an. *Cercina*), the loftiest of the Balkhan chain, 6,395 ft. in height. (*Bruguière, Géographie de l'Europe*.) The Balkhan has recently acquired a greater degree of interest than most of the other chains, from its being supposed to form an all but insurmountable barrier to an invading army. This, however, does not appear to be really the case. The W. portion of the Balkhan is seldom more than 4,000 ft., and its more easterly portion, near the Black Sea, not more than from 1,800 to 2,000 ft. in height, while it is traversed by half a dozen different passes, none of which is fortified. Hardly one of those appears, in fact, to present any very formidable obstacle to an invading army; and Major Keppel expresses his surprise that the Russians did not cross the Balkhan long before their last irruption into Turkey. (*Keppel, Journey across the Balkhan*, II. 11.) We may further mention that there are more lines of communication for carriages across the Balkhan, between Thrace and Bulgaria, than between any of the other Turkish provs. Indeed, there is only one road between Macedonia and Bosnia, and one between Macedonia and Servia; the last, though the only route by which the merchandise of Macedonia is conveyed to the N., being merely a mule track. There are three passes between Macedonia and Albania, but only one between Albania and Thessaly.

European Turkey has numerous narrow valleys, and some very extensive plains. By far the largest of the latter is that of Wallachia, Moldavia, and Bulgaria, traversed in its centre by the Lower Danube, and ranking at least as the third, if not the second, of the great plains of Europe. A considerable portion of Thrace, and some parts of Macedonia, are level, and Thessaly principally consists of a very fertile basin. Almost every part of the country is well watered; and, besides the Danube and Save (which last constitutes a great part of its N. boundary), Turkey has several rivers of very considerable size. Among those on the N. side of the great central plateau and its ramifications, affluents of the Save and Danube, are the Unna, Verbas, Bosna, Drin, Morava, Timok, Schyl, Isker, Abta, Jakumitza, Sereth, Pruth, &c. Among the rivers to the S. of the central plateau, the following may be specified, viz. the Maritza (an. *Hebrus*) has its sources in the N.W. angle of Roumelia, in the Balkhan and Despot-Dagh mountains, and flows generally E. or S.E. to the centre of Thrace. Near Adrianople, where it receives the Toudja (the *Tonzus* of Ptolemy), and thence S. or S.W. to the *Ægean*, which it enters close to the Gulf of Enos, after a course of about 240 m. Its greatest width is about 3 furlongs. Adrianople, Philippolis, Demotica, Ipsala (an. *Cynclæa*), &c., are on its banks, which, in many parts, are covered with forests of oak and elm. The Maritza is navigable from the time of the autumnal rains till May, as far as Adrianople, for boats of 200 tons; but during the summer months sea craft ascend only as high as Demotica. (*Kriepel, l. 253*.) The Kara-su (*Arastus*), Struma (*Strymon*), and Vardar (*Arilus*), which traverse Macedonia in a S.E. direction, are all of considerable size, but generally shallow and unfit for navigation. The Selenbria (*Peneus*) rises near Mezzovo, and drains the basin of Thessaly, falling into the Gulf of Salonica at the mouth of the famous defile and vale of Tempe. The principal rivers flowing into the Adriatic are the Narenta, in Herzegovina, and the Driu and Vojitza (*Aous*), in Albania.

European Turkey has no lakes of any very great extent. The principal are those of Ochrida (*Palus Lynchia*), about 20 m. in length by 8 m. in breadth, Scutari (*Palus Labentis*) and Yanina, in Albania; there are numerous small lakes in Macedonia and Thessaly.

The physical geography of Asiatic Turkey requires but a brief notice, having been already treated of in the arts. NATOLIA, KURDISTAN, SYRIA, &c. in this work. Asia Minor consists chiefly of an extensive table-land, traversed by many parallel mountain ranges from W. to E., extending into Armenia and Kurdistan. This table-land appears generally to increase in height as we proceed eastward; Mount Ida, overlooking the Plain of Troy, being only about 5,000 ft., while Mount Bisutun, the culminating point of N. Kurdistan, is 12,000 ft. above the sea. From this lofty plateau several mountain ranges are given off to the S., inclosing the basins of the Euphrates, Tigris, Jordan, Orontes, &c., which, with the Halys (see NATOLIA, ante, p. 378.), Saigarius, Araxes, &c., are the principal rivers in this part of the empire. The largest lake is that of Van (which see); next to which are the Dead Sea and Lake of Tiberias, in Palestine: many small lakes exist in Natolia. The N.

part of Asiatic Turkey is mountainous, the surface declining towards the S., where it spreads out into extensive plains (an. *Chaldea, Mesopotamia, E. Syria, &c.*) of much natural fertility, but at present for the most part desert and uninhabited.

The coasts of Turkey, both in Europe and Asia, are in general bold and rocky. In many parts they present a long and tolerably uniform line, with few gulphs or bays of any magnitude. This is particularly the case with the coasts of the Black Sea, Syria, and a part of Albania. But the shores of the *Ægean* and the adjacent seas are deeply indented with numerous bays and inlets, and present many good harbours, as those of Smyrna, Salonica, Constantinople, &c. Varna is the only good Turkish port on the Black Sea.

Durazzo (the an. *Dyrachium*), on the Albanian shore, might easily be rendered an admirable port (see *Uraguast's Turkey*, &c. p. 199.); but at present there is not a single safe or convenient harbour along the whole W. coast of European Turkey.

The *Geology* of the two great portions of the Ottoman empire presents considerable differences. The great mountain chains of Europe consist of granite, gneiss, trachyte, syenite, serpentine, talc, mica, and clay-slate, and many other primary and transition rocks, inclosed between beds of sandstone or limestone; the latter being the most prevalent formation in the alpine ranges of the W. provs. and in Thrace. This latter prov., with Bulgaria, &c., consists, in great part, of shelly limestone, marly clay, and other tertiary formations. Iron and other metallic ores are found in great abundance; but volcanic formations appear to be scarce in Europe than in Asia. In Asia Minor, according to Mr. Brant, "the whole range of mountains, from sea to sea, is limestone. Volcanic rocks are frequently found, and granite rises up occasionally. The mountains abound in veins of copper and lead, the last being rich in silver. Mineral springs frequently occur; most of them hot." (*Geog. Journal*, vi. 184.)

As the country rises towards the E., granite and the other primary rocks become more prevalent. The lower basins of the Euphrates, the Danube, and other large rivers, are mostly alluvial.

*Climate, and Natural Products.* — In a region extending through nearly 20 degs. of lat. and more than 30 degs. of long., having every variety of elevation, exposure, soil, and subsoil, there must necessarily be the greatest variation of climate. The climate of European Turkey is much colder than that of the parts of Italy and Spain under the same latitudes, and is so very changeable that at Constantinople Fahrenheit's thermometer is said sometimes to fall 31° within an hour. In the Danubian provinces snow lies several feet deep, on the higher mountains, for six months together; the thermometer frequently stands between 10° and zero, and in Moldavia it has been known to descend to 15° below zero. On the other hand, the summer heats are oppressive, and even in the N. the grape ripens by the end of July. The temperature and salubrity of Asiatic Turkey is almost equally variable with that of European Turkey. In the highlands of Armenia, even the plains are covered with snow as late as May; and the fine season, properly so called, does not comprise more than four months of the year, during which period both sowing and reaping are completed.

Asia Minor has but two seasons, the transition between them being scarcely perceptible. In winter, while the uplands are covered with snow, the lowland plains and valleys are visited by perpetual rains and N. winds. During summer there is scarcely any rain, but the soil is fertilised by heavy night-dews. Caranama suffers from very arid winds; and in the delta of the Euphrates and Tigris the barometer often rises to 30". The climate of Syria, Mesopotamia, &c., has been already noticed in the arts. SYRIA, BAGDAD, and BASSORAH.

The best indication of the relative temperature of different parts of Turkey is afforded by their vegetable products. In Croatia, Bosnia, and the adjoining provinces, the mountains are covered with forests of oak and elm; S. of the Balkhan the country is covered with forests of the sycamore, carob, and plane trees; gardens of roses, jasmine, and lilac; vineyards and orchards of nearly all kinds of fruit-trees; but is destitute of the olive, which, except in some particularly favourable situations, does not thrive N. of lat. 40°. The flora of Albania is similar to that of the opposite coast of Italy; and in Thessaly, the garden of European Turkey, such wine, cotton, tobacco, figs, citrons, pomegranates, oranges, and lemons, &c., grow to perfection. The same fruits and other products, flourish in the more sheltered parts of Asia Minor, even on the shores of the *Ægean*; where, however, owing to the severity of the N. winds, among other causes, the forests seldom extend up the mountains above 5,000 ft. In Armenia and Kurdistan, the olive and orange ripen only in the warmer valleys, and we find on the high grounds much of the vegetation that

prevails in the mountainous provs. on the Danube and Save. S. of Taurus we enter an entirely new region, where the date palm, oriental plane, Babylonian willow, banana, pistachio, sugar-cane, and indigo, betoken a close approach to the vegetation of tropical climates. (*Geog. Journ.* x. 505-508, &c.)

The forests of European Turkey are infested by bears, wolves, jackals, &c.; to which, in parts of Asia, may be added, it is said, the lion and tiger. The gazelle, and deer of various kinds, hares, and other kinds of game, are very abundant. The great bare-necked vulture inhabits the rangos of Taurus, and the ostrich wanders over the sandy deserts of the South. The camel, a native of this region, is the chief beast of burden throughout the greater part of Asiatic Turkey. The other domestic animals will be mentioned hereafter.

*Population.* — We have already stated that the pop., as well as the area of the Turkish empire, is very imperfectly known. Hence there is the greatest discrepancy in the estimates which have been formed of its amount, which vary from 6 or 7 to 21 or 22 millions for Turkey in Europe, and in about the same ratio for the Asiatic provinces. Latterly, however, the Turkish government has directed some portion of its attention to statistical inquiries, and the pop., though the accounts of it be still very vague, is better known now than formerly. In as far as respects Turkey in Europe, the estimates on which most reliance may be placed are those of Mr. Urquhart (*Turkey and its Resources*, p. 272.), and of M. Boné (*Turquie d'Europe*, ii. 32.). We subjoin these estimates: —

	Pop., according to Mr. Urquhart.		Pop., according to M. Boné.
Wallachians and Moldavians -	1,500,000	Wallachia, 1839 -	2,400,000
Osmanlis -	700,000	Moldavia, 1838 -	1,110,000
Greeks (Hellenic race and language, all Christians) -	1,180,000	Servians -	886,000
Albanians (Squaker race and language, two thirds Mohammedans) -	1,600,000	Musulmen in Servia -	10,400
Tribes of Slavonic race and language, Bosnia, Herzegovinians -		Bosnians -	700,000
Bosnians, Tulemans, Pannce, one third Mohammedans; the rest (Servians, Bulgarians) Christians of the Greek and (Myrtilites, Croats) of the Latin church -	6,000,000	Croats -	200,000
Vlach-Greek church -	600,000	Montenegrins -	100,000
Cypriotes -	200,000	Bulgarians -	4,500,000
Jews -	100,000	Albanians -	1,600,000
Armenians -	500,000	Greeks -	900,000
Franks, &c. -	50,000	Zinzars (Wallachians of Hungary) -	300,000
Total -	12,180,000	Turks -	700,000
		Armenians -	100,000
		Jews -	250,000
		Gypsies -	150,000
		Franks, &c. -	60,000
		Total -	14,577,572
		Or at most -	15,250,000

The Turks or Osmanlis, who have, for about four centuries, been the dominant race, were originally of Scythian or Tartar extraction. We have already noticed their general characteristics as they are found in Asia at the present day (i. 185.). But it is of importance to observe that even there the Turkish blood has been largely intermixed with the Mongolian and the Persian; and in Europe the higher class of Turks have generally furnished their harems with the finest women of Circassia and Georgia; while the inferior Turks have allied themselves with Servians, Albanians, Bulgarians, Greeks, &c. In consequence the original and distinguishing features of the race are now, in Europe at least, very much obliterated; and the Turkish, from being one of the ugliest of Asiatic nations, is become, speaking generally, one of the handsomest; though, from the peculiar mode in which the race is maintained, there is necessarily the greatest variety in their stature and appearance.

Turkish ladies have, in general, very white delicate complexions, a consequence of their se-

dentary mode of life, and of their habit of veiling themselves when they take the air. Their mode of life, and their great addiction to the bath, render them rather disposed to *embonpoint*; but it is absurd to allege that this constitutes the *ne plus ultra* of a Mussulman's idea of beauty. Had such been the case, the Circassians and Georgians would not have constituted the pride of the harem. (*Boné*, i. 58.)

The national character and dispositions of the Turks have changed as well as their physical constitution, but in a far less degree. They are now, as of old, at once excessively proud and excessively sensual. Their pride is a consequence of their ignorance, and of the recollection of their former victories and conquests; and their sensuality is a consequence of the peculiar nature of the Mohammedan paradise, and of their wish to realise in this world some portion of that felicity which is to be the portion of all true believers in the next. Other nations have affected to believe in the doctrine of predestination, but in this respect the Turks alone have given a practical effect to their speculative tenets; and their stationary state and contempt for the inventions and discoveries of other nations may be, in no small degree, ascribed to their conviction of their inutilty; from their belief that every thing that occurs is determined by an overruling Providence, against whose decisions it would be alike vain and impious to contend. Speaking generally, the Turk is true to his word; he is not prone to anger, nor liable to sudden gusts of passion; but when provoked, his fury has no limits; and he becomes brutal and ferocious in the extreme, involving the innocent and the guilty in one common ruin. His religion interdicts the use of wine; and though not always respected, this precept has, on the whole, a great and salutary influence.

Though capable, on emergencies, of great and vigorous exertion, laziness and apathy are distinguishing characteristics of the Turks. There is nothing in which they take so much delight as in reclining in the shade from sunrise to sun-set, apparently in a state of total indifference, occasionally sipping coffee, and inhaling the fumes of tobacco. Whatever may be their object, they saunter through the streets with the same measured and monotonous step. They converse little, and the presumption is that their mind is as indolent as their body.

Perhaps no nation ever possessed so little talent for governing others as the Turks. They have never struck their roots, or acquired any solid footing, in the countries they have conquered. They are encamped in and occupy them; but they hold them by no tie other than the sword. They have never coalesced or associated with the original inhabs.; they look upon themselves as the nation, and the rest of the people, or those at least who have not embraced Mohammedanism, as an inferior and degraded race, which it is, if not a duty, at all events but a venial offence, to insult and trample upon. In this respect they differ widely from the Tartars who overrun China, and, indeed, from every other people; and to this more than any thing else their weakness, and the wretched state of the countries subject to their dominion, is to be ascribed.

We have elsewhere noticed, under the names of the countries which they principally inhabit, the more important features in the constitution and character of the other great races inhabiting the Turkish empire; and to these we beg to refer the reader. (*See ARABIA, ARMENIA, BUL-*

GARIA, GREECE, SERVIA, SYRIA, WALLACHIA, &c.)

*Property.*—There is, in many respects, a considerable similarity between the mode in which property has been distributed in Turkey, and that in which it was distributed in Europe during the middle ages. In both cases the object in view in this distribution was the establishment and support of a militia, who should be bound to repair, at their own expense, to the standard of the sovereign, and to follow him in his campaigns. *Le gouvernement militaire est devenu la constitution fondamentale de tous les États Musulmans. Chaque individu s'y reconnoît soldat; toujours il est prêt à prendre des armes et à marcher sous l'étendard du prophète. On doit enfin considérer la nation (Turque) comme un grand corps d'armée dont le souverain est le généralissime.* (*D'Osson*, iv. 302.) Hence when the Turkish sovereign made any new conquest, the territory into estates called, from their greater or lesser size, *zaimets* and *timariots*, which they assigned to the more deserving or most favoured of their followers. The latter, however, did not succeed to the hereditary or absolute property of these estates. On the contrary, they only held them during life or good behaviour; and whenever any vacancy occurred, whether by death or forfeiture, the sultan made a new appointment to the vacant fief; and it is affirmed that instances have been known of the same lordship having been held by eight different masters in the course of a single campaign! It is further to be observed, that the rights of the peasantry (*rayahs* or cultivators) on these estates were carefully preserved; and, in point of fact, the new feudal lord, or lord of the manor (*spahi*), was merely entitled to demand from them, in full of rent, a tithe of the produce of their land and of the increase of their stock; and in consideration of this, he was not only bound to perform military service to the sultan, but also to protect the cultivators on his estate. When the Turkish institutions were in their vigour, and the exactions of the pachas and feudal lords were restrained by the vigilance of the sultan, this state of things contrasted most favourably with the rapine and anarchy that then prevailed in the greater part of Europe. 'I have seen,' says a contemporary writer, 'multitudes of Hungarian rustics set fire to their cottages, and fly with their wives and children, their cattle and instruments of labour, to the Turkish territories, where they knew that, besides the payment of the tenths, they would be subject to no impositions or vexations.' (*Leucæus in Turc. Imp. Statu.*)

According to the imperial survey ordered by Solymán the Magnificent, the number of *zaimets*, or estates, estimated at 500 acres of land, and upwards, amounted to 3,192, and the number of *timars*, or estates valued at from 500 to 500 acres of land, amounted to 50,160; the whole furnishing a revenue of nearly 4,000,000 rix-dollars, appropriated to the maintenance of an army of about 150,000 men. (*Present State of Turkey*, i. 220, 221.) Olivier states that in his time it was computed that there were in the European part of the empire 914 *zaimets*, and 8,356 *timars*; the number in Asia being nearly the same, and the whole furnishing a militia of above 60,000 men.

In 1814, it would appear that there were still 914 *zaimets* in Europe, and in Asia 1,479; the annual revenue from these amounting to from 25,000 to 100,000 aspers each, which, at 100 aspers to a Turkish piastre, would give a yearly income of about 50*l.* on an average from each; but more recently the numbers of both have been still farther reduced.

Latterly, too, or since the disorganisation of the empire, all sorts of abuses have crept into the management of the estates held by the *spahis*, or feudal lords. These have been oppressed by the pachas; and they, in their turn, oppress the cultivators, increasing their demand for corvees or other services, and claiming and exacting, though illegally, a much greater portion of the produce than the tenth, to which they are legally entitled. And yet, despite their pillage of the cultivators, many *spahis* have, like the *zemindars* in Hindostan, been forced to abandon their estates; and indeed, in many districts, especially in Asia Minor, owing partly to the illegal exactions of the lords, but still more to the arbitrary exactions of the pachas, the cultivators have wholly deserted the lands. The truth is, that, in most parts of Turkey, power makes law; there is no real security, the rights of the people being trampled on at the pleasure of those in authority.

But it would be the greatest imaginable error to suppose that all, or that even the greater portion of the lands conquered by the Turks, were distributed in the way previously stated. The revenues of extensive tracts were appropriated to mosques, the great officers of state, the mother and mistresses of the sultan, the children of the imperial family, and the sultan himself; and after these deductions, the residue, which still amounted to a very large proportion of the whole, was left, burdened

with a tithe or land-tax of one tenth part of the produce, to the ancient proprietors. These, if Mohammedans, had the privilege of going to war; others, whether Turks or Christians, that is, infidels, who, from choice or civil disability, devoted themselves to the arts of peace, and enjoyed their estates under the protection of the law, commuted their military service by the payment of a tribute instead.

It is commonly said that Turkey is a country in which there is no security for property; and if by this be meant that it is exposed to illegal exactions of all kinds, partly by the feudal lords, and partly and principally by the pachas and their subordinate authorities, nothing can be more correct. But it is not true, speaking generally, to allege that in Turkey private property is not recognised by law, or that it may be seized at the pleasure of the sultan. This is the case, no doubt, with the property of persons in the public service, whose lives and fortunes must answer for their real or imputed misconduct. But all other sorts of property are respected in Turkey; and even a pacha, or other public functionary, who has acquired property by the most objectionable means, may, if he please, easily place it beyond the grasp of the grand seignior. To accomplish this, he has merely to settle it on his family and direct heirs, leaving the reversionary interest in it to some mosque, which, on receiving a nominal quit-rent, takes charge of the property, which can no longer be either forfeited or affected by the crimes or misconduct of the original founder of the family or his heirs. Property so left is denominated *racof*. But this device, though quite effectual for the object in view, necessarily tends, in the end, to accumulate much too great a quantity of property in the hands of the church; so that in obviating one abuse it occasions another.

If the Hatt-i-Scherifs, or imperial decrees, issued within the last three or four years, were really carried into effect, they would effect a total and most beneficial change in the conditions under which property is held in Turkey; practically, however, we believe they will have little effect, at least for many years to come.

*Agriculture.*—In Turkey the cultivators do not live dispersed over the country in hamlets, or in single farm-houses, but are congregated in villages, which, owing to the depopulation of most districts, are frequently at great distances from each other. These villages present a very striking picture of primeval manners, each family providing itself with most articles required for its consumption, while their municipal affairs, or those in which the community have an interest, are conducted by their elders. The village communities in certain districts, especially of European Turkey, enjoy considerable powers; and wherever this is the case, or where a tract of country happens to belong to a powerful individual, the cultivators, speaking generally, are comparatively prosperous. This, however, is the exception, oppression and a want of security being the usual consequences of Turkish ascendancy.

Turkey is not dependent upon any foreign country for the subsistence of its inhabs.; it yields, on the contrary, corn and other produce, sufficient not only for the home demand but also for exportation. Ten times the produce might, however, be raised in these fine countries were a better policy adopted, and the inhabs. protected against vexatious exactions. The native *rayahs* or peasants, by whom cultivation is carried on, have generally little or no capital; and as the tax on the crop has generally to be paid before the produce is gathered, they are in most cases obliged to borrow the money for this purpose at a ruinous rate of interest. Agriculture is accordingly in a very backward state throughout most parts of the empire. In Thrace, Boué says, the rotation of crops is tolerably well understood; but elsewhere in European Turkey cultivation is extremely depressed. Manuring is next to unknown, and in the mountainous parts, particularly in Servia and Albania, an immense waste of timber occurs, from the forests being burnt that the ground may be fertilised by their ashes. The ploughs (except perhaps in Wallachia and a few other provs.) are of the most wretched description, being seldom shod with iron, and fit only to scratch the surface of the earth: a bunch of thorns performs the functions of a harrow; and the other farming implements, if so we may call them, are in general equally bad. Thrashing is performed, as in most eastern countries, by treading out the grain with cattle; the straw being subsequently chopped by dragging over it a sort of heavy cylinder stuck with sharp flints. But the fertility of certain portions of the empire, as Thessaly, the valley of the Maritza, &c., is so great, that, despite the low state of husbandry, the average produce of corn is said to amount to from 15 to 30 times the seed.

On the whole, the cultivation of the soil appears to be better understood in Bulgaria than anywhere else. (*Boué, La Turc. d'Europe*, iii. 2.) Some notices of the agriculture of this and the other European provs. will be found under their separate heads in this Dict.

Maize is the principal species of grain cultivated in Eu-

ropean Turkey, in the mountain-valleys as well as the plains, except in Bosnia, &c., where the climate is too cold. Wheat, rye, barley, oats, and buckwheat are also pretty generally cultivated; and millet is grown in the more sheltered places. Rice is grown only along the banks of the Maritza and other marshy tracts in the S. provs. The quantity of this grain produced in European Turkey being insufficient for the consumption, a portion of the required supply is imported from Egypt and Asia Minor. Great quantities of haricots, beans, cabbages, onions, melons, cucumbers, tomatas, capsioms, &c., are raised as articles of food; but the potato is eaten only in Bosnia, Croatia, Herzegovina, Montenegro, and a few places in Servia and Albania: lentils, turnips, artichokes, asparagus, beet-root, and many other vegetables common amongst us, are almost unknown in Turkey. Though not usually drunk by the Mussulmans (except those of Lower Albania), wine is grown in most provs. of Turkey in Europe, but Wallachia and Moldavia (which see), Bulgaria, and Servia, are the principal wine countries.

Turkish wines are mostly red; white wine is produced only in Wallachia, W. Bulgaria, and at Semendria, and a few other places. The best wines are very high coloured and somewhat similar to those of Cahors, and of Radeopaul in the Papal States. These are grown chiefly in Macedonia, in the basins of Scutari and Pristren in Albania, Mostar in Herzegovina, on the hills along the Servian Morava in Thracia, and in the vicinities of Lovdisha in Bulgaria, and Metcra in Thessaly. Certain growths in the S. W. of Macedonia, deserve particular mention. The inhabs. of these places possess in fact, a valuable source of wealth, for there is no doubt that several of their wines might be advantageously exported. (*Boué*, ii. 251.) The want of proper cellars for storing the wines, and their rude preparation, detract greatly from their excellence. In Thessaly and Albania they are commonly spoiled, at least in the estimation of most foreigners, by the addition or absorption from the barrels, skins, &c., of resin or turpentine. In certain cantons, however, the use of such substances is not supposed to be necessary, and the wines there are accordingly very palatable. In Bosnia the vine is replaced by the plum, and the favourite beverage there is a liquor made from its juice, called *slivovitz*. Peaches, apples, cherries, almonds, hazel nuts, &c., are grown, but grafting, and all other horticultural operations, are either unknown or much neglected. The olive flourishes in the S. provs. only, and most of the Turkish oil is grown in Asia. Flax, hemp, sesamum, saffron, cotton, tobacco, castor oil, &c., are added, as being the principal remaining articles of culture. The care of the forests does not seem to occupy much attention; nothing like a forest board exists, and in many districts, formerly well wooded, wood for fuel is becoming scarce.\* Live hedges are rare; where the fields are enclosed it is either with dry wood or stone walls, and where neither material is plentiful, as in E. Thracia, the fields are entirely open.

We have already given some notices of the condition of property and cultivation in Asiatic Turkey in the arts, NATOLIA, KURDISTAN, SYRIA, &c. In regard to Armenia, Mr. Brant says, "I had scarcely seen any place in this region approach to the state of apparent prosperity enjoyed by the inhabitants of the plain of Kharpout. An Armenian farmer there had ten pair of draught oxen, and a few cows and sheep. The produce of his land was—wheat about 375 bushels, valued at 75*l*. a year; cotton to the value of perhaps 28*l*.; grapes about 3,300 lbs.; which, together with millet, lentils, and other sundries, made up the value of about 142*l*. sterling. The millet, and fifty bushels of wheat, the grapes and sundry produce were consumed by the farmer and his family. The cotton sold, after the lord of the soil had taken his rent, was about sufficient to pay the tax of 10 per cent. on the whole produce to the pacha. I was not informed how much land he had in cultivation; there is no measure of land; it is estimated by the quantity of seed used in sowing, or the number of oxen necessary to plough it. They do not manure much, but allow the land to lie fallow every alternate year. Such is the general system of agriculture throughout Armenia." (*Geog. Journ.*, vi. 207—208.) The vine, and mulberry, tobacco, cotton, and oil, share the chief attention of the agriculturists in Asiatic Turkey, after the production of the grains, &c., necessary for food. The culture of silk is extensively carried on in several districts, but especially round Brusa in Asia Minor, where the mulberry-tree is kept cut short, and receives a good deal of careful attention.

In consequence, however, of the oppressions practised on the cultivators, vast tracts of land in Asia Minor are wholly deserted, or occupied only by the scanty population of a few wandering tribes. No where, indeed, is

the destructive influence of Turkish misgovernment so apparent as in the present state of this celebrated country, favoured alike by situation and climate, and which, in antiquity, was the seat of many noble cities, and powerful and refined nations. Industry and civilisation have all but disappeared. "No care whatever," says Mr. Kinnier, "is taken to improve the land; nor can this be a matter of surprise, when we reflect that the farmer is liable to be turned out at a moment's warning, and is certain of being taxed or plundered in exact proportion to the yearly produce of his farm. It is not, indeed, uncommon, should there be a prospect of a plentiful harvest, for the crops upon the ground to be seized by the pacha at a low valuation, and then put up to the highest bidder. This system, so destructive of industry, may be traced to the ill-judged but favourite policy of the Porte in continually changing the governors of their provinces, lest by being settled for a considerable period in their governments, they should shake off their allegiance, as many have already done. The pacha, therefore, who, during the short time he remains in favour, has not only to feed the avarice of the Imperial ministers, but also to accumulate an independency for himself before his retirement from office, is heedless of the interests of the farmer, or of those who are to succeed him, and only anxious to collect wealth. We consequently observe that those provinces where the chiefs maintain their independence, are invariably the richest, best peopled, and in every respect the most flourishing; since they find it their interest to encourage the cultivators of the land, who are continually deserting those parts of the country immediately governed by the sultan's officers, to place themselves under their protection. The prosperity of the provinces of Asia Minor is in this manner always fluctuating, according to the actions and dispositions of their respective rulers. Sometimes they are well peopled and cultivated (I speak comparatively), and at others waste and forsaken; whole villages emigrate from one district to another without much trouble or expense, since their houses are simple and of easy construction, and their articles of furniture so trifling as to be transported with facility on the backs of the cattle, which supply them with milk during the journey, and every where find abundance of pasture. The Greeks, called *Urooni* by their Turkish lords, constitute a considerable portion of the peasantry in this part of the empire, and are not, in my opinion, the edified and dastardly race usually represented. The political or religious institutions of a state affect, without doubt, the character of a people, and this is no where more conspicuous than throughout those quarters of the globe where the blighting doctrines of Mahomet have been diffused. The unjust and cruel penalties carried on by the Turks have damped the fiery spirit of the Greeks, and rendered distrust and deception absolutely necessary to the safety of their persons and property; whereas, under a more enlightened and less despotical government, the national character of that people would probably rise to the standard of the inhabitants in most of the civilised countries of Europe. To me they have always appeared as dispirited and broken-hearted; but at the same time ready to rise, if supported, and crush their vindictive rulers to the earth." (*Asia Minor*, &c. p. 51.)

There are in Turkey great numbers of sheep and goats, the flesh of which constitutes the principal animal food of the inhabitants; but there are proportionally fewer cattle than in other countries of Europe, beef being seldom, and veal never eaten, by the Turks. The sheep are nearly all of a small, thick-bodied breed, with a white fleece; merino, large-tailed, or other improved breeds, are met with only in Servia, into which they were introduced by Prince Milosch, or in Bosnia. In Wallachia the sheep have tall spiral horns, and their wool is a principal source of wealth. The pastures there are fine and extensive, and large flocks are brought thither from Transylvania, to be depastured during winter. At the same season the sheep from the table-land of Cappadocia, &c., are driven into the plains of N. Syria; and many of the migratory Koord and Turkman tribes of Asia seek the pasture lands about Angora, the traders of which town supply their various wants, receiving in return the wool, skins, and other produce of their flocks, in which articles Angora has a very considerable trade. (*Geog. Journ.*, vi. 213.) The cattle along the banks of the Save and Danube appear to be a degenerate Hungarian breed. Those of the more S. provs. are different, being of medium size, and short-horned. Oxen are every where employed in field labour. Buffaloes are common, particularly in Bulgaria and Thracia. In Bosnia and other W. provs. some tolerably good cheeses, similar to Gruyère, are made; but the cheese of most parts of Turkey is in general too insipid to suit our taste. In making cheese, the milk of ewes and goats is partially employed, but in general only in the absence of that of the cow and buffalo. Turks abhor the hog so much, that they do not generally permit it

\* In Servia, says Boué, la dévastation de ces belles forêts de chênes et de hêtres se continue activement. But we incline to think that this statement at present is incorrect, government of late years having prohibited the cutting of timber. (See SERVIA, ante, p. 672.)

sale in the towns, where they form the chief proportion of the pop.; and Boué says, "that the carcases of hogs are only suffered to be brought to Constantinople at certain periods of the year, under an especial firman." (i. 503.) Nevertheless, they are reared in vast numbers in Servia, Bosnia, and other N. and W. provs., and, in fact, constitute the chief resource of the Servians. The Turks are good horsemen, and take pride in their horses. Little of that care is, however, bestowed on them that is common in W. Europe. They are fed only twice a-day, sometimes they are not put into stables, and are not groomed and trimmed as in Europe. The horse of European Turkey is generally of middle size, or rather below it, with a short neck, strong limbs, and a bay, chestnut, reddish brown, or white, seldom a grey colour. They are usually fed on barley; oats being used for horses only in the N.W. provs. The horses of Asiatic Turkey seem to be chiefly of Arabian descent. "The Monténik are an excellent race of horses, bred by a great tribe of that name on the banks of the Euphrates. In Armenia and Koordistan a prodigious number of fine animals might be procured at a cheap rate for the cavalry; the horses of Bagdad are large, and many of them show a great deal of blood; but those bred in the desert bordering on Damascus, are upon the whole the finest. I have heard of a poor Arab at Antioch in Syria, refusing 36,000 piastres for a mare of that breed. The only blood-horse I ever met with in Asia Minor was bred near Ouscat in the plains of Cappadocia, and may be descended from that which was so much admired by the Romans." (*Kinnier's Asia Minor*, &c., p. 508.) The ass is much used in Roumelia, S. Albania, &c. Mules are scarce in those provs., but very numerous in Montenegro, and other mountainous parts of Turkey.

There are mines of copper, argentiferous lead, iron, &c. in various parts of both European and Asiatic Turkey; and it is generally believed that several of the mountain chains, which bound or intersect the Turkish provs., contain ores, not only of the useful, but of the precious, metals. The Wallachian and Moldavian gipsies collect from the beds of the rivers pellets of gold mixed with a small quantity of silver, by means of which they are enabled to pay into the treasury the annual tribute of a drachm of gold imposed upon each man. But mining industry is not profitable in Turkey from various causes. "The ignorance of the people in the art of working the mines with economy is perhaps one cause of the neglect with which the Ottomans appear to treat this source of wealth; but the chief obstacle to exploration is the rapacity of government, which would seize upon the advantages of any new discovery, and subject the provincialists to the unrequited labour of opening the mines and extracting the ore." (*Thornton*, ii. 31, 32.) Asphaltum, nitre, salt in Wallachia, &c., and coal in Bulgaria, are among the mineral products of the empire, but are by no means raised to the extent that they would be under a liberal political system. Between Eski-sher and Servia, in Asia Minor, the substance called *merschakum*, so much used for German pipes, is found in large quantities. A specimen, procured by Mr. Alnsworth at this place, fresh from the mines, proves it to be a hydrated silicate of magnesia. It is a porous friable stone, almost entirely composed of small-grained vitreous or transparent felspar, decomposing and passing into a variety of porcelain earth. Great quantities of pipe-bowls are manufactured from this material, and sent to Constantinople for export into Germany, &c. (*Grog. Journ.*, x. 490, 491.; *Clarke's Trav.*, &c.)

The manufactures of Turkey are more numerous, and display greater excellence, than might have been expected in a country so backward in the arts: indeed, her success in manufacturing industry is, upon the whole, greater than that of several countries ranking higher in civilisation. Thornton, who though somewhat partial to the Turks, is on the whole, an excellent authority, says, "I know not whether Europe can equal, but certainly cannot surpass, the Turks in several of their manufactures. The satins and silk stuffs, the velvets of Brusa and Aleppo, the serges and camlets of Angora, the crapes and gauzes of Salonica, the printed muslins of Constantinople, the carpets of Smyrna, and the silk, linen, and cotton stuffs of Cairo, Scio, Magnesia, Tokat, and Costambol, establish a favourable, but not an unfair, criterion of their general skill and industry. The workmen of Constantinople, in the opinion of Spon, excelled those of France in many of the inferior trades. They still practise all that they found practised; but, from an indolence with respect to innovation, they have not introduced or encouraged several useful or elegant arts of later invention. They call in no foreign assistance to work their mines: from their own quarries their own labour extracts the marble, and more ordinary stone which is employed in their public buildings. Their marine architecture is by no means contemptible, and their barges and smaller boats are of the most graceful construction. Their foundry of brass cannon has been much admired, and their musket and pistol barrels, and

particularly their sword blades (though the sword blades of Damascus are not so famous as formerly) are held in great estimation even by foreigners." (*Pres. State of Turkey*, i. 67, 68.) Their manufactures of Morocco and other leather, and of gold and silver lace, &c. deserve also to be mentioned with praise.

But if the Turks be more successful in the practice of some of the useful arts than is commonly supposed, they have made no progress in the fine arts, and are necessarily ignorant of the higher sciences. "Their buildings are rude incoherent copies, possessing neither the simplicity nor unity of original invention. Heavy in their proportions, they are imposing only from their bulk; the parts do not harmonise, nor are they subservient to one leading principle; the details are bad both in taste and execution; the decorations have no use, no meaning, no connection with the general design; there is nothing which indicates the conceptions of genius. The energies of the latter are chilled and repressed by the monotony of Turkish habits and the austerity of their customs. Their cities are not adorned with public monuments whose object is to enliven or embellish the circus, the forum, the theatre, the pyramid, the obelisk, the column, the triumphal arch, are interdicted by their prejudices. The ceremonies of religion are their only public pleasures. Their temples, their baths, their fortifications, and sepulchral monuments, are the only structures on which they bestow any ornament. Taste is rarely exerted in other edifices of public utility, *khanes* and *bezestins*, bridges and aqueducts. Sculpture in wood or in stucco, and the engraving of inscriptions on monuments or seals, are performed with neatness and admirable precision; and the ceilings and wainscoting of rooms, and the carved ornaments in the interior of Turkish houses, show dexterity and even taste. But their paintings, limited to landscape or architecture, have little merit either in design or execution; proportion is ill observed, and the rules of perspective are unknown. They reckon time by lunar revolutions, so that in the space of 33 years the Turkish month passes through every season. Their knowledge of geography does not extend beyond the frontiers of their empire. Their surgery is rude, from want of science, of skill, and of instruments." (*Ibid.*, 69—77.)

The domestic manufacture of cotton stuffs in Turkey is pretty general; and Cananbakh estimated the consumption of raw cotton in the Turkish empire at 20,000 bales a year, 10,000 of which are consumed in the fabrics of Thessaly alone (*Handb. der Geog.*), the best Turkish yarn being made in this prov. Urquhart says, that in the S. provs. the poorest family requires 20 okes of uncleaned cotton, and 10 of wool, for its yearly consumption; and the manufacture of these materials occupies a large share of the peasant's in-door labour. Handkerchiefs, shirting, long-cloths, napkins, coarse cotton stuffs, and clothing in general, are the goods principally produced by their looms; and, according to Urquhart, 24,000,000 lbs. of cotton manufactures, worth 5,000,000*l.* are made annually in European Turkey and Greece. (p. 150.) Very little dependence can, however, be placed on these statements; and there can be no doubt that the native manufacturers, who produce goods not for domestic consumption but for sale, have been involved in the greatest distress in consequence of the importation of English and other foreign goods. The manufacture of cotton yarn has been especially interfered with, and English cotton twist is now generally used for warp in such Turkish looms as are still at work, and is an article of increasing consumption.

The commerce of Turkey owes most part of its activity to the immunities and protection enjoyed by those engaged in it; which are not extended to individuals occupied in other avocations. "The cultivator of the soil is ever a helpless prey to injustice and oppression, and the manufacturer has to bear his full share of the common inaccuracy; he is fixed to the spot, and cannot escape the grasp of the local governor. The raw material monopolized by a bey or *ayan* may be forced upon him at more than its fair value, and perhaps its quality may be inferior; fines may be imposed on him; he may be taken for forced labour, or troops may be quartered on his workshop." (*Urquhart*, p. 139.) It was not till 1827 that a firman was issued by the sultan allowing the free exportation of wheat to foreign countries. The Turkish gov. had previously been accustomed to prevent the exportation of grain from any part of the empire till Constantinople had been first abundantly supplied. In this view, the principal corn-growing provs. were obliged to furnish to the officers of the sultan a quantity of wheat equal to about a 12th part of the produce of their harvests. This contribution was called *istira*. The *istira*gi, or collectors, on receiving the corn from the p<sup>ro</sup>prietor, paid him 20 paras for every kilo (about 60 lbs.). The total quantity of corn thus purchased for the supply of the capital amounted to about 1,000,000 kilos a year: this was sent by sea to Constantinople, and lodged in public granaries on the

N. side of the harbour. As this stock was considered a resource against times of scarcity, it was not distributed till it began to be damaged, unless when it could be sold with considerable benefit. This frequently happened; for individuals were not suffered to lay up their corn in magazines to re-sell in a similar manner; and Olivier estimated the yearly produce of this monopoly at 10,000 purses, or 5,000,000 piastres. After the treaty which opened the Black Sea to the commerce of foreign nations, vessels with cargoes from the Russian ports were allowed the free passage of the Bosphorus and Hellespont; "a privilege," says Thornton, "so important, that I have known ships, which had surreptitiously loaded wheat, the produce of the Turkish prov., sail to the Russian port of Odessa, and subject themselves to the delays and expenses of performing quarantine, paying the harbour fees and custom-house duties, for no other purpose than to obtain a certificate of their cargo being the produce of Russia, and thereby rescuing it from the vexations and extortions of the officers of the Turkish *miri*." (1. 256.) Other articles of provision, such as sheep, oxen, butter, cheese, wax, tallow, &c., used to be bought up in the same manner by the officers of government at their own price; but probably this system has now been in great part abolished; and except in the article of provisions, no restriction on commerce ever existed in Turkey. All foreign articles may be imported into the Turkish ports, without let or hindrance of any kind, on payment of an import duty of 3 per cent. *ad valorem*; and all articles of foreign and domestic growth or manufacture may be freely conveyed all over the empire. Her commercial system is, in fact, by far the best feature in the policy of Turkey.

The internal traffic of Turkey is greatly impeded by the badness or rather total deficiency of roads. Burgess says the sultan has not an inch of road in his dominions, which would not, in any civilized country, be indicted as a nuisance. (*Greece and the Levant*, p. 143.) Accordingly, in many provs., particularly in Asia Minor and Armenia, the communication between different places is quite cut off in winter, unless they can correspond by sea. Wheel-carriages are of course disused; and the caravans of merchants, from Hungary to the Persian Gulf, consist of horses and camels, by which almost all merchandise is conveyed. In European Turkey, after the capital, Adrianople and Salonica are the chief centres of trade, and the first being the great *dépôt* for all the goods coming by land to Constantinople from England, France, and Austria, supplies all the fairs throughout Roumelia and Bulgaria. (*Keppel's Journey across the Balkan*, p. 255.) Next to Smyrna, Aleppo is the chief seat of commerce in Asia. Caravans bring thither pearls, shawls, Indian and Chinese goods, from Bussorah and Bagdad; camels from Arabia; cotton stuffs and thread, Morocco leather, cones of hair and galls from the paches of Mosul, Diarbekir, Orfa, Aintah, &c.; furs, goat's hair, wax, gum ammoniac, &c., from Van, Erzeroum, and Kars; silk, copper, furs, and linens, from Asia Minor; silk, Mocha coffee, soap, scented woods, ambergris, drugs, and pearls, from Syria and Arabia; rice, coffee, and Egyptian produce, from Latakia; silk manufactures from Brusa and Damascus; European cotton and woollen stuffs, printed muslins, hardware, watches, wrought amber, and fur, from Smyrna and Constantinople. The principal articles of export are, sheep's wool, goat's hair, cattle, horses, hogs (from Servia, &c.), hides, hare skins, wheat, raw cotton and silk, tobacco, raisins, figs, almonds, mastic and other gums, gall-nuts, vallonene, leeches, honey, wax, saffron, madder, anise and fennel, turpentine, safflower, meerschaum pipes, whetstones, carpets, silk and cotton fabrics, leather, copper and metallic wares, ornament, &c., with Arabian, Persian, Indian, and Chinese goods. The principal imports are linen, woollen, cotton, and silk goods, colonial products and dye stuffs, hardware and earthenware, paper, furs, &c. The British trade in Manchester, Glasgow, Birmingham, and Sheffield manufactures, and other British produce, has, however, been steadily increasing during the last 10 years. Subjoined is an

ACCOUNT showing the Quantities of the Principal Articles imported into the United Kingdom from Turkey\*, in 1838, 1839, and 1840. [See top of next column.]

The wealthier class of Turks are generally too apathetic and indolent for commercial pursuits, which they leave to the Greeks, Armenians, Armabouts, and Jews. "The extreme simplicity of commerce, from the absence of all legislation on the subject, is visible in the establishment of a merchant: no books, save one of common entry, are kept; no credits are given; no bills discounted; no bonds, nor even receipts: the transactions are all for

ready money; no fictitious capital is created; no risk or loss from bankruptcy to incur. A merchant, whose capital may exceed 20,000*l.*, will, very possibly, be without a clerk; and a small box, which he places on his carpet, and leans his elbow upon, encloses, at once, his bank and counting house." (*Urquhart*, 136.)

Accounts are kept in piastres of 40 paras of 3 aspers each; or in purses of 500 piastres. But the rate of exchange is very variable, on account of the continual deterioration of the coin. In 1810, the pound sterling was worth only 12 piastres; but in 1839, it was equivalent to 104, and in 1842 is worth nearly 120*l.* The most common measures and weights are the *oke* = about 24 lbs., and the quintal of 44 *okes*. The *arschine* = 2 ft. Eng. Distance is commonly measured by the hour = about 3 m.

*Government*, &c. — Châteaubriand said of the Turkish government that it was an absolute despotism, tempered by regicide! In truth and reality, however, the government of Turkey is a species of theocracy. The grand seignior is supposed to be the lieutenant and vice-gerent of the prophet, and consequently, also, in some degree, of the Deity himself. But though, at first sight, this may appear to confer all but unlimited powers on the sovereign; and though, in some respects, it certainly gives very great latitude to his actions, it at the same time subjects him to various restraints and limitations, which he dares not contempt or break through. His authority, in fact, is principally bottomed on the Koran; and were he to abandon its doctrines, and to act in the teeth of its precepts, or those deduced from it by eminent commentators, and sanctioned by custom, the foundations of his authority would be loosened, he would cease to be the lawful sovereign, and would be regarded as a usurper whom it is meritorious to dethrone. Hence, though absolute in some respects, the power of the grand seignior is, in others, in the last degree limited. He may put those engaged in his service to death at pleasure, but were he to interfere in any way with property left in trust to a mosque, or to outrage the law by drinking wine in public, he would run a great risk of exciting discontent, and if he persisted in such conduct, of being dethroned.

"The Turks," says an accurate observer, "learn very early that, if the prince be of right divine, he founds it on the Koran; that he is constituted such by the sacred code of laws, which, as a true believer, he has studied, and knew, before his accession to the throne, it would ever be his duty to observe; and that, consequently, he is as much bound and tied by all those laws as they themselves are."

"This is so explicitly and fully laid down in the Koran, that Mohammed thought it necessary to throw in rules of exception expressly for himself."

"Hence, when the people are notoriously aggrieved; their property or that of the church repeatedly violated; when the prince will riot in blood, or carry on an unsuccessful war; they appeal to *law*, pronounce him an infidel, a tyrant, unjust, incapable to govern; and, in consequence, depose, imprison, and destroy him." (*Porter's Observations on the Turks*, i. 109, 12mo ed.) And every one who has any knowledge, how slender soever, of Turkish history, is aware that this principle has not been inoperative; and that the Turks have, over and over again, exercised the right of resistance to what they looked upon as arbitrary power.

It may not, however, be out of place to mention that this dependence of the sultan on the Koran, though it limits, in some degree, his power to tyrannise over his subjects, opposes, at the same time, the most formidable obstacles to his attempts to introduce any organic changes, how expedient or necessary soever. The rights and social condition of the people, living in the Turkish empire, who have not embraced the religion of the conquerors, is supposed to be determined by the Koran. And hence the difficulty — without, as it were, overturning the very foundations on which the monarchy rests — of effecting any material changes in the situation of the dependent population. The Turks cannot, unless they abandon their own religion, amalgamate with them, or raise them to the same level as themselves; so that the nation must always consist of two distinct parts —

\* In the official accounts, the commerce of Turkey is not distinguished from that of Greece N. of the Isthmus; but the latter is quite inconsiderable.

the Turkish, or ruling portion; and the rayahs, or subjugated infidels, who exist upon sufferance, and who can never arrive at any situation of power or emolument. The character of the Mohammedan religion is, in truth, an all but insuperable obstacle to any thing like real reform. Though less intolerant than many others, it inculcates on the mind of its votaries the most exalted ideas of their own importance, and the most profound contempt for all sorts of unbelievers. There may, no doubt, be an imitation of European tactics, and an attempt to introduce something like the practices and institutions that prevail in European states; but it is impossible, so long as the religion of the prophet maintains its ascendancy, that they can have any considerable influence. Submission to their power has saved the unbelieving population of the country from death; but nothing short of their embracing the religion of the conquerors can effectually protect them from insult and contempt, and consequently, also, from extortion and tyranny.

The grand seignior is assisted in the government of the empire by a cabinet-council or *dewan*, consisting of the principal ministers of the empire, and of the mufti or head of the law. Until very recently the sultans were in the habit of delegating the greater portion of their authority to the grand vizier (*vezir azam*), who became, as it were, regent of the empire, being at the head of the civil government, and generalissimo of the military and naval forces. But of late years the powers of this high functionary have been very much curtailed. Indeed, the place was wholly abolished by the late, though it has been revived by the present, emperor. The functions of the other ministers correspond with those of minister for foreign affairs (*reis el-hudi*), of the interior, commerce, and finance (*teftardar*), and of a commander in chief (*seraskier*), a grand admiral, &c. The court of Constantinople is generally known in other European countries by the title of the *Sublime Porte*, a designation derived from the *Bab Humum*, or principal outer gate of the *seraglio*, whence the *hatti sheriffs*, or imperial edicts, are usually issued.

The *sheik-ul-islam* (mufti), or head of the clergy and chief interpreter of the Koran and the canonical laws, is a very important functionary. He nominates to all the principal offices in church and law; and takes precedence of every other subject in the empire, even of the grand vizier. On most great occasions the sultan applies to the sheik-ul-islam for a *fatwa*, or legal opinion, to ascertain whether his intended course of action be in accordance with the Koran. But this is not indispensable, and has very rarely been refused. Latterly, too, the opinions of the mufti have become of less importance.

The mufti is always chosen from the *ulema*, a body comprising the clergy with the interpreters and administrators of the law. But, though they all study together, the lawyers and judges are quite distinct from the clergy; it being left to every young man brought up in one of the colleges of the order to determine for himself, when he has attained a proper age and acquired a sufficient stock of learning, whether he will become a priest, or a doctor of law, or a judge; but it is to the latter, or the lawyers, that the title of *ulema* is more peculiarly appropriated.

Throughout Turkey, the ministers of religion are all subordinate to the civil authorities, who exercise over them the powers of diocesan. Magistrates may supersede and remove clergymen who misconduct themselves, or who are unequal to the proper discharge of the duties of their office. The magistrates themselves may also, whenever they judge proper, perform all the sacerdotal functions; and it is in virtue of this prerogative, joined to the influence which they derive from their judicial power and their riches, that they have so marked a pre-eminence, and so preponderant an authority, over the ministers of public worship. (Thornton, l. 126.)

The members of the *ulema* constitute a sort of aristocracy. They pay no taxes or public imposts, and, by a peculiar privilege, their property is hereditary in their families, and is not liable to arbitrary confiscations. Their persons are sacred; their blood may on no account be shed; nor can they be legally punished in any way but by imprisonment and exile. It is to be observed, however, that the power and dignity of the *ulemas* are not hereditary in individuals, but in the order. Formerly they held their offices for life; but about the end of the 17th century they were made removable at pleasure, like all other public functionaries. They now are appointed only for a year. Each individual, however, enjoys all the privileges of the order, independently of his holding any office, or exercising any public employment. There have been instances of muftis declining to obey the commands of the grand seignior, and of their remonstrating with him on the impropriety or illegality of his conduct; though, as the sultan makes the mufti, and can depose and exile him at pleasure, such conduct must necessarily be very rare, except when some formidable conspiracy is on foot, and when the powers of the sultan are consequently circum-

scribed. In the reign of Mustapha, the people put to death the mufti for having, as they alleged, misled the sultan. Cantemir says, that Murad IV. commanded a mufti to be pounded in a marble mortar, saying, that heads, whose dignity exempts them from the sword, ought to be struck with the pestle! but the fact is doubtful. (Thornton, l. 130.) Speaking generally, the influence of the mufti and *ulema* is uniformly opposed to all measures of reform; at least, to such as might be supposed to militate in any way against the peculiar doctrines and regulations enforced by the Koran.

Besides the *ulema*, there is a privileged order, limited to the descendants of Mohammed by his daughter Fatima. These are called *omras*, or *amras*, have *synd* prefixed to their names, and are authorised to wear green turbans. Inasmuch, however, as they are very numerous, *omras*, like brahmins in India, are found in even the most abject ranks of life.

The government of the provinces is extremely rude, and is practically, indeed, little else than a tissue of abuses. European Turkey was formerly divided into the two great governments, or *ojaks*, of Roonelia and Bosnia; the former of which was subdivided into 16 sanjacks, or great governments, or pachahs, and the latter into 7, besides some inferior governments. The power of the pachas within their respective districts is, in many respects, unlimited. They have under them *mussulmans*, or sub-pachas, in whom they delegate a portion of their authority, and who watch over a certain extent of territory. Every pacha, or governor, is supposed to represent the sovereign within the limits of his own jurisdiction, is invested with his authority, and exercises his prerogatives in all their plenitude. Nominally, however, contentious jurisdiction, or the determining differences between subjects, is left to the *cadi*, or judge, in conformity with the principles of *mussulman* government and the practice of the sultan.

Formerly the pachaliks (or rather *beglerbeghs*, for such was the name given to the larger governments) were much more extensive than at present; and it not unfrequently happened that a pacha, at the head of a large government, having succeeded in getting his creatures made pachas of the surrounding governments, acquired such a degree of power as to be able to cast off his allegiance, and defy the sultan. Latterly, however, it has been the policy of the government to diminish the sanjacks, and so to lessen the danger of insurrection on the part of the pachas. The latter are appointed only for a single year; and the limits of the different pachaliks are being constantly changed. (Banc, iii. 181, &c.)

All *mussulmans*, how humble soever their origin, are eligible to, and may fill, the highest offices in the state. In Turkey, birth confers no privilege, all true believers being equal in the eye of the law. But this sound principle is rendered of little or no value, or rather positively injurious, by every thing being made to depend on the pleasure of the sultan. With the exception, indeed, of the law and the church, no previous study or preparation, nothing, in short, but the favour of the prince, which is most frequently obtained by the most unworthy acts, is wanted to elevate individuals from the very lowest to the very highest stations; and hence it is, that though individuals be sometimes found in Turkey admirably adapted for the situations they fill, these are very rare exceptions, incapacity and unworthiness for their duties being the distinguishing characteristics of Turkish functionaries.

Till this vicious system be wholly abandoned, and individuals be appointed to important situations from other motives than the mere caprice of the sultan, it is nugatory to suppose there can be any substantial improvement. In this respect, however, little or no progress has hitherto been made. When Marshal Marmont visited Constantinople, towards the close of the late sultan's reign, who had been called, and not without reason, the Turkish reformer, a black eunuch was a general of brigade; and Achmet Pacha, who was then a general of cavalry, had been bred a shoemaker, in the harbour! And a more recent period as a waterman in the harbour! And a short while subsequent to this the same Achmet Pacha was made *capitan pacha*, or high admiral of the fleet, of the duties of which station, it is hardly necessary to add, he knew no more than he did of the Principia of Newton. This, we apprehend, may be taken as a pretty fair specimen of Turkish reform. Marshal Marmont, who is a most intelligent and unexceptionable judge, says, that *aujourd'hui, comme autrefois, le fiasco est le caprice du maître sont les seuls titres pour occuper les emplois les plus importants. Les prétendus progrès en civilisation du gouvernement Turc n'ont pas encore consacré le principe qu'il faut apprendre ce que l'on veut savoir.* (il. 58., 12mo. ed.)

But if the rapid advancement of individuals from the lowest to the highest stations be so common in Turkey as hardly to excite attention, the sudden downfall and total ruin of the most exalted functionaries is no less common. In fact, a man who takes office in Turkey loses

from that moment all feeling of security, and tactily admits the right of the sultan to deprive him at pleasure of his office, his property, and his life. "All the officers of government owe," to use the words of Mr. Thornton, "their appointment to the sole favour of the sultan, without respect to birth, talent, services, or experience. They are deposed and punished without the liberty of complaint or remonstrance; and at their death the sultan inherits their property." (l. 162.)

Formerly the government of pachaliks and other important situations, if not bestowed by the sultan on some of his favourites, were regularly sold to the highest bidders, the leases being renewed annually, provided the pacha or other functionary remitted to Constantinople a sufficient douceur, or, if not, he was superseded by some less parsimonious competitor. And, when in office, the only criterion of an approved administrator was the magnitude of his douceurs, and the amount of tribute he remitted to the public treasury, no inquiry being ever made into the means by which this revenue was raised.—*Quasunque modo viri* was the brief and comprehensive maxim by which their conduct was regulated. "To rob those below him that he may bribe those above him, is the constant aim and sole object of each petty tyrant, through all the gradations of this laudible despotism." (*Modern Trav., Turkey*, p. 94.) The legitimate revenues of the pachas arise from the rents or produce of lands assigned for their maintenance, and from certain fixed imposts on the cities, towns, and villages of their pachalik. These, however, are in most instances the smallest portion of the revenue of the pachas. The far greater portion consists of illegal demands of all kinds, which the people have no means of resisting. M. Beaujour states that, during the time he resided in Salonica, the pacha enjoyed a revenue of about 140,000 piastres, derived from the rent of land, casualties, and other legitimate sources; and that, in addition to this, he made about 100,000 piastres more by *aanians*, or extortions! And yet this pacha was regarded as a man of singular justice and humanity! (*Tribunaux de Constantinople de la Grèce*, i. 47.) Judge, then, what must be the state of a province governed by a covetous and rapacious pacha, which is the general character of these functionaries.

The flagrant abuses consequent on such a system have brought the Turkish empire to its present state of weakness and degradation; and the necessity of making some very decided changes in the administration has been long obvious. In consequence, a hatti scherrif, or imperial decree, was issued 3d Nov. 1839 (see *post*), which, if it could be *bona fide* carried into effect, would go far to suppress most part of the existing abuses, and to introduce security and good order. But, unfortunately, the age of miracles is past, and nothing short of a miracle would suffice for the regeneration of the Turkish empire. Some of the grosser abuses may be suppressed; but, speaking generally, they are too deeply seated, too much interwoven with the religion of the country and the constitution of society, to allow any one to suppose that they can be extirpated otherwise than by the agency of some tremendous revolution, that should overthrow every thing that now exists. There is neither public virtue nor knowledge in Turkey sufficient to accomplish any considerable reforms. Corruption and venality are very where the order of the day; and M. Boué, who has very recently been in Turkey, and is well acquainted with the people and their institutions, affirms that now, as heretofore, the important places of pachas and cadis are sold to the highest bidder, *sont, pour ainsi dire, des chucheries au plus offrant!* (iii. 224.) And he farther affirms, that the most trifling as well as the most important affairs are all settled by the intervention of *douces*! A sovereign, with the absolute power, sagacity, and sternness of purpose of Peter the Great, might, perhaps, effect a substantial reform of the Turkish government; but to suppose that such a sovereign should be bred in the slothful luxury of the seraglio, is a contradiction and an absurdity.

In addition to the numerous sources of weakness and decay originating in vicious institutions and a bad system of government, may be added the imperfect subjugation of the countries comprised within the limits of the empire. The inhabs. of several districts, both of European and of Asiatic Turkey, enjoy, some almost a total and others a sort of semi-independence; forming so many asylums to which discontented and rebellious subjects from the adjoining provs. may retreat and form new schemes, and holding out the seductive and dangerous example of successful resistance. Exclusive of Servia, which is now only nominally under the Porte, there are numerous districts in Albania and Thessaly that are all but independent. Of these, the most important is the country called Myrddita, or the mountainous Drin. They can bring 10,000 men into the field, pay no taxes, and do not even allow a single Turk to remain within their boundaries! In many parts of Epirus there

are similar independent communities. The extensive district of Montenegro, under the government of a bishop, is also substantially independent; as are several districts in other parts of the country. In Asiatic Turkey the Druses, Maronites, &c., in Syria, have succeeded in maintaining their independence; and many of the Turkman and other tribes found in Asia Minor are only nominally dependent on the Porte. (*Boué*, iii. 192–209., &c.) With such elements of disorder scattered over the whole face of the country, the only wonder is that anarchy and insubordination are not more widely diffused than we find them to be.

Mr. Urquhart devotes a large portion (caps. ii. iii. and iv.) of his work on Turkey to a description of its municipal establishments, of which he greatly overrates the importance. No doubt, however, they are the best part of the Turkish institutions. They form, as it were, so many little republics. Their authorities or elders, which are freely chosen by the inhabs., assess and collect the poll, house, and land taxes; manage the municipal funds, arbitrate in petty matters, &c. These communities are modelled upon a plan similar in almost all respects to the village system of Hindostan.

*Justice.*—The Ottoman empire is governed by a code of laws called *mullicka*, founded on the precepts of the Koran, the oral laws of Mohammed, his traditions, usages, and opinions, together with the sentences and decisions of the early caliphs, and the doctors of the first ages of Islamism. This code comprises a collection of laws relating to religious, civil, criminal, political, and military affairs; all equally respected as being theological, canonical, and immutable, though obligatory in different degrees, according to the authority which accompanies each precept. In some instances it imposes a duty of eternal obligation, as being a transcript of the Divine will revealed to the prophet; in others it invites to an imitation of the prophet in his life and conduct. And though to slight the example be blamable, it does not entail upon the delinquent the forfeiture or penalty of any estate, while the decisions of doctors on questions that have arisen since the death of the prophet are of still inferior authority. When a matter occurs that has not been foreseen or provided for by the early promulgators of the law, the Sultan pronounces a decision; and his authority is absolute in all matters that do not interfere with the doctrines or practical duties of religion. The code *mullicka* is, however, alone considered as paramount law: the decisions or decrees of the Sultan (hatti scherrif), of which a compilation was made by Solyman the Magnificent, under the name of *canon nameh*, are considered as emanations from human authority, and, as such, are susceptible of modification, or even abolition, remaining in force only during the pleasure of the Sultan or his successors. (*Thornton*, l. 167. &c.) The *adul* or provincial customs are also allowed considerable influence.

In all the districts and towns of the empire, justice is administered by judges (*cadis*), who are of five different ranks, according to the importance of the place in which they are established, each cad being assisted by a deputy, or *naib*. Nothing can be more simple and expeditious than the forms of proceeding in Turkish courts. Each party represents his case, unassisted by counsellors, advocates, or pleaders of any kind, and supports his statement by the production of evidence. The deposition of two competent witnesses is admitted as complete legal proof, in all cases whatever.

The promptitude of Turkish justice has been often praised; but though dilatoriness be, in this respect, highly blamable, we apprehend that it is a far less evil than the other extreme. In Turkey no ordinary legal authority can detain an untried man in prison more than 3 days; and in criminal cases the execution of sentences follows close upon the decision of the judge; but neither of these regulations appears to be advantageous; for, in the one case, sufficient time is not allowed to prepare either a defence or an accusation; and in the other, the immediate execution of the sentence prevents the power of appeal to a superior tribunal, and consequently takes away the only means of getting an unjust decision reversed, and, what is of more consequence, an unjust or ignorant judge exposed and degraded. In the greater number of civil cases appeals may be made from the *naib* to the *cad*, from the latter to the *cad-i-asker*, or judge of the prov., and hence to the sultan. The latter, however, is rarely practised; and is effected only by presenting a petition for redress to his highness on his way to the mosque. Bastinado, fine, imprisonment, the galleys, and capital punishment, by hanging, drowning, beheading, or strangling, are the principal means of disposing of criminals. Death is sometimes awarded for what we should consider comparatively venial crimes, as, for instance, unfair dealing on the part of tradesmen; though a butcher or baker convicted of short weight is more frequently nailed by the ear to the door of his shop.

Speaking generally, the administration of justice is in the most disgraceful state in Turkey. According to law, all the judgments of the pachas and of their deputies

should be submitted to the *cadl*, and can only be legally carried into effect when approved by the latter. But, in practice, this salutary regulation is generally disregarded, and in most cases the sentences of the *pacha* are executed whether they be approved by the *cadl* or not. (*Boué*, iii. 351.) But the grand vice of Turkish justice consists in the venality of the judges and the toleration of perjury. "The monarch's despotism is not the greatest evil in Turkey: his subjects would, perhaps, bear that without much murmuring or great distress. The radical destruction of all security lies in the iniquitous administration of their laws, which are an impending sword in the hand of corruption, ever ready to cut off their lives and properties." (*Porter*, i. l.) Mr. Thornton seems to think that Turks have rarely to complain of injustice, and that, speaking generally, the decisions of the judges, in cases where both parties are Mussulmen, are fair and impartial. We are assured, however, by those well acquainted with the fact, that this statement must be received with great modification, and that a rich or powerful Turk has, in most instances, little or no difficulty in obtaining a decision in his favour, however unjust his cause; and that as respects Christians and Jews, they have no chance in a litigation with a Turk, unless they succeed beforehand in securing the good offices of the judge. It is a principle of Turkish law that written testimony is of no avail when opposed to living witnesses; and hence every precaution should be taken to render the latter trustworthy. But, instead of this, the most detestable perjurers enjoy an all but total impunity, and carry on a lucrative as well as an infamous profession. False swearing is punished by leading the culprit through the streets seated on an ass, with his face turned to the animal's tail; and even this punishment, trifling as it is when imposed on such wretches, is rarely enforced. Magistrates are compelled to decide according to the evidence of notorious perjurers, unless they detect their falsehood at the moment. The subjects of foreign powers residing in Turkey are allowed, in virtue of treaties to that effect, to support their claims by written evidence. (*Thornton*, i. 196, &c.)

M. Boué, whose remarks on the administration of justice are as superficial as can well be imagined, is good enough to inform his readers that *si on ne pouvait pas citer de faux témoins, des témoins subornés à prix d'argent, et même des juges qui se laissent gagner, la justice Turque mériterait tout aussi bien ce nom que la nôtre*: (iii. 355.) True, and on the same principle we might say that if A. were not a thief, he would be as honest as B.

There is a considerable discrepancy in the accounts of the state of the police in Turkey, though most recent travellers say that it is extremely defective. No doubt, however, considering the abuses inherent in every department of the administration, it is superior to what might have been expected. This is mainly ascribable to the regulation which makes every district of the country responsible for all the murders, robberies, and other crimes of violence committed within its bounds; and which consequently makes their repression the business of all the more respectable inhabitants.

Owing to the jealousy of the Turks of the invasion of their privacy, no writ of search can at any time be executed in the interior of the house of a Turk, but in the presence of the *imam*; nor in that of a Christian, except accompanied by a priest, nor of a Jew unless a *rabbi* be present. The rooms occupied by the women, which are never entered, frequently shelter criminals.

**Army.**—The Turkish land forces may comprise, exclusive of artillery, about 100,000 infantry, of whom about 70,000 are regulars (*nizam*), and about 100,000 cavalry, of which by far the largest proportion formerly consisted of irregular troops, partly and principally furnished by the *spahis*, and other holders of estates, on condition of military service; but of late years the number of this description of troops has been greatly reduced. Previously to 1826, the janizaries formed the nucleus and main strength of the Turkish armies; and, though now destroyed, a short notice of that once famous militia, long the terror and scourge of Christendom, may not be unacceptable.

The most probable opinion seems to be that the janizaries were originally established by Amurath I., in 1362, and consisted at first of about 12,000 Christian captives, who were renewed by incorporating with them a fifth part of the prisoners of war. "But when the royal fifth of the captives was diminished by conquest, an inhuman tax of the fifth child, or of every fifth year, was rigorously levied on the Christian families. At the age of 12 or 14 years, the most robust youths were torn from their parents; their names were enrolled in a book; and from that moment they were clothed, taught, and maintained for the public service. According to the promise of their appearance, they were selected for the royal schools of Brusa, Pera, and Adrianople, entrusted to the care of the *pachas*, or dispersed in the houses of the Anatolian peasantry. It was the first care of their masters to instruct them in the Turkish lan-

guage: their bodies were exercised by every labour that could fortify their strength; they learned to wrestle, to leap, to run, to shoot with the bow, and afterwards with the musket; till they were drafted into the chambers and companies of the janizaries, and severely trained in the military or monastic discipline of that order. The youths most conspicuous for birth, talents, and beauty, were admitted into the inferior class of the *agamogians*, or the more liberal rank of *ichogians*, of whom the former were attached to the palace, and the latter to the person of the prince." (*Gibbon*, chap. 65.)

It is needless to add that the janizaries were taught to believe implicitly in the doctrines of Mohammedanism; and, having no relations or family ties to bind them to society, they regarded themselves not merely as the soldiers, but as the children, of the sultan. They enjoyed, partly by the voluntary and partly by the forced concessions of their sovereigns, several valuable privileges and immunities. They formed the body guard of the sultan; they were stationed in the capital, and paid, not like the rest of the army, by assignments of land, but in money; and their captain was one of the most important officers in the public service.

But though formidable at first only to the enemies of the country, they gradually became hardly less formidable to their sovereigns. According as the severe discipline by which the Turkish armies had been originally distinguished was relaxed, and the sceptre fell into feebler hands, the janizaries became unruly, insolent, and overbearing. On various occasions they insulted the majesty of the throne, and, in 1623, they even proceeded to depose Osman II. Hence it had long been to a favourite object with the sultans to endeavour to weaken the force and influence of the janizaries. But their efforts in this view had, until very recently, but little success. Selim III. having endeavoured to counteract the influence of the janizaries, by creating a regular army (*nizam*), the former mutinied, and Selim lost his life in the commotions that ensued. But his successor, the late sultan, was more fortunate in his struggle with this unruly soldiery. In 1826 he issued a *hatti scherrif*, directing that the janizaries should be incorporated with the regular troops. The janizaries refused to obey this order; but the sultan having previously secured the co-operation of the mufti and of their *shahs*, they were completely defeated; and such of them as escaped the conflict in which they were involved, were deprived of their former insignia, and distributed among the new regiments of the line, so that there is now hardly a trace to be found of this once powerful force.

Previously to and since the destruction of the janizaries, it has been a favourite object with the last and present sultans to organise and discipline their troops after the European fashion. But it does not appear that hitherto their efforts have been attended with much success; and it seems doubtful whether the troops have gained as much by the change in their discipline and tactics, as they have certainly lost in the decline of their enthusiasm and sense of nationality. They are now fully aware that they have become the *peuple mu* of the empire, and the very infidels they were so long accustomed to hold in contempt; and that circumstance has made them lose that confidence in themselves, for the want of which it is very difficult, if not impossible, to compensate.

The regular troops are raised by a conscription among the Turkish part of the pop. Inasmuch, however, as little or no attention is paid to the number of children in a family, or even to the health, size, or age of the conscripts, the conscription is found to be an intolerable hardship; and the recruits produced by it are of the most motley kind, youths of 15 and 17 being intermixed with men of 40, 50, and 60 years of age! The mortality among the conscripts is very heavy. According, however, to the *hatti scherrif* of 1839 (see note), the defects in the present recruiting system are to be obviated; and the period of service is to be reduced to four or five years.

The uniform of the regular troops is blue, faced with red. The household troops, or body guard of the sultan, comprises the *élite* of the army; their pay and appointments are better than those of the other troops. Marshal Marnont, whose intelligence and experience entitle his opinion on military matters to the greatest weight, makes the following statements with respect to the state of the Turkish troops:—

"The lot of the Turkish soldiers is a very happy one. They are better fed than any other troops in Europe, having an abundance of provisions of excess of quantity, and partaking of meat once, and of soup twice a day. Their magazines are filled with stores, and the regiments have large reserves. The pay of each soldier is 20 piastres."

\* The number of janizaries who fell in this conflict, or massacre, as it has been called, has been greatly exaggerated. Marshal Marnont says that not more than 5000 lost their lives in Constantinople in the conflict, and in the punishments by which it was followed. A few were killed in other parts of the empire.

tres per month\*; the whole of which he receives, as there is a prohibition against withholding from him any part of that sum. In short, every thing has been effected that could promote the welfare of the soldier.

"If no fault can be found on the score of the *matériel*, much is to be said against the *personnel* of this force. On the arrival of Achmet Pacha, we repaired to the exercising ground. Four battalions were in line; and, after inspecting them, they manoeuvred before me. Nothing could be worse than this exhibition; indeed, these men ought not to be looked upon as troops, but merely as a mass of people, bearing the stamp of misery and humiliation; and they are evidently depressed by a knowledge of their own weakness. They all seem to have a willingness about them, but feel ashamed of their occupation; and, from the private to the colonel, not an individual amongst them has any conception of his duty. Moreover, the men are diminutive in stature, and wretched in appearance: many of them are too young for service; and we are led to inquire what is become of that noble Turkish people, the lofty, proud, majestic, handsome race of former days; for now we find no trace of them in the existing troops.

"I have endeavoured to discover why they have not hitherto succeeded better with the new system, and I thus account for the failure. The sultan was desirous of organising troops according to the European mode; and his ambition was to form an army on the instant. He accordingly raised at once a great number of regiments; but the instructors, being generally individuals of an inferior station of life, without capacity or talent, who had been led to Constantinople by the circumstances which attend revolutions, were unfitted to accomplish the object in view.

"The new organisation commenced simultaneously in all the corps; and the same description of persons were universally employed in endeavouring to carry it into effect. In none of the grades had any man confidence either in himself or in others; and no one, therefore, had a right to the command, which should always be derived from some superior claim. It is only as a consequence of such a principle that men are ever found disposed to yield obedience. In the troops of all the other powers of Europe, there are two admitted titles to precedence—birth and merit. The former has its basis on a higher social grade, which, by giving opportunities for better education, leads to the expansion of the mind; the latter, on the experience and information resulting from previous service. In Turkey there are no gradations in the social order, and the son of the water-carrier is on a par with the vizier's child, having often the same education. Hence, there is no admitted superiority in those invested with power; and the previous equality indisposes others to obey authority obtained through mere caprice.

"As to the right derived from merit or experience, there can be none where all are novices.

"Such were the radical defects that prevailed in the formation of the Turkish army. The remedy would be to reduce things to their elements; and to re-commence, by establishing in public opinion a respect for talent and capacity. In order to obtain that obedience and confidence in superiors, without which an army cannot exist; for it is such confidence that produces discipline and order, and creates the moral power requisite to give unity, compactness, and energy to the whole.

"If, instead of attempting to raise an army, as it were, by a mere decree, the sultan had been content with forming a single battalion, and had obtained the services of 30 or 40 really good officers, and a chief capable of comprehending the importance of his duties, it is probable that, in two years, he would have succeeded in producing a battalion to serve as a model for the rest; and, this result once obtained, the sultan would have possessed the elements required. At the end of six months, or, at the utmost, of one year, by adding to the numbers of those first enrolled, and dividing the whole into two battalions, he might have formed a complete regiment; for the men of the first levy would, in the eyes of the recruits, have appeared as old and instructed soldiers. It is obvious that in ten years he would then have obtained an army. Whereas, according to the system followed, such a result is improbable, for an union of men like the present cannot be said to merit this title." (*Translation by Smith, p. 61., &c.*)

If the opinions of so eminent a judge as Marshal Marmont of the bad quality of the Turkish troops required any confirmation, it would be found in the history of their campaigns with the Egyptians. How superior soever in point of numbers, they never were able to make any head against the latter, till supported by European troops. The irregular troops consist principally of Kurds and Albanians, who, when properly commanded, make excellent troops.

The same corruption that infects the other depart-

\* Strictly speaking, this is the pay of the guards only; the others receive 15 piastres per month. (*Boue, lii. 350.*)

ments of the Ottoman government, extends to that of the army. The pachas, commanders of regiments, and other functionaries, contrive to make large sums by keeping on their books a greater number of troops than they really have, and putting the pay and other emoluments drawn on their account into their pockets. At inspections, the place of the deficient troops is supplied by substitutes hired for the occasion, who disperse as soon as the inspecting officers have retired! (*Boue, lii. 332.*)

The attempt to reform the Turkish army would really, therefore, appear to have been one of the most abortive that has ever been made. The nationality, fanaticism, and confidence of the troops in themselves has been destroyed, and nothing but a miserable imitation of European tactics and discipline substituted in its stead. The ignorance of the officers, and the mischievous principle, if we may so call it, on which they are selected, were the first evils that should have been corrected; and, till they have been obviated, no other improvement can be of the smallest consequence. Marshal Marmont speaks very favourably of the school established at Constantinople for the instruction of the guards; but supposing it and other schools to be kept up, a lengthened period must elapse before they can have any material influence. Unless, indeed, the sultan should be able to avail himself, which probably the prejudices of his subjects will not permit, of the services of European officers in the command and organisation of his army, we apprehend that it is not destined speedily to acquire any considerable degree of efficiency or strength.

*Navy.*—It is unnecessary to enter into any lengthened details with respect to the Turkish navy. At no time has Turkey been considerable as a naval power; and as the Turks have no taste for the sea, her best sailors have always been Greeks, Christian slaves, or renegades. In 1770 the Turkish fleet was destroyed by the Russians in the harbour of Tchesmech; and the defenceless state in which the coasts, and even the capital, were then found to be placed, awakened the attention of government to the subject. Since that period many fine line of battle ships have been built in the Turkish ports, principally under the direction of Europeans; but, owing to the unskillfulness of the crews, and the still but total ignorance of the officers, most of whom have not been bred to the sea, and when appointed to be lieutenants and captains, can hardly distinguish between a rudder and a main-mast, the money laid out on the ships has been little better than thrown away. The battle of Navarino inflicted a severe blow on the Turkish navy, and soon after the accession of the present sultan, the capitan-pacha, or high-admiral, carried off the fleet to Alexandria, and delivered it up to Mehmet Ali! The latter, however, has since been obliged to return it. The emancipation of Greece, which formerly furnished the best sailors to the Turkish fleet, has been a serious injury to the latter.

*Houses and Mode of Life.*—The houses of the Turks are built in contempt of all architectural rules. They are mostly only of one story, and are very rarely more than two stories in height, constructed of wood and sun-dried bricks, those of the better class being plastered and painted over on the outside. The windows when they open on a street or other exposed situation, are uniformly covered with lattice-work, which prevents the most inquisitive eyes from obtaining even a glimpse of what is going on within. But though mean and shabby on the outside, the houses of the more opulent Turks are often very sumptuously fitted up in the interior. The most convenient and magnificent apartments belong to the *harem*, or to the portion of the house appropriated to the exclusive use of the women; and this very frequently opens on a court having a fountain in the middle, and sometimes on a garden. The houses of the poorer classes are most uncomfortable, their windows being generally without glass, and their rooms without fire places. In winter they are usually heated by means of braziers, or pans of charcoal, which suffocate while they warm.

Lady Mary W. Montague has given a lively and accurate description of the houses of the higher class of Turks. "Every house," says her ladyship, "great and small, is divided into two distinct parts, which only join together by a narrow passage. The first house has a large court before it, and open galleries all round it, which is to me very agreeable. This gallery

leads to all the chambers, which are commonly large, and with two rows of windows, the first being of painted glass: they seldom build above two stories, each of which has galleries. The stairs are broad, and not often above thirty steps. This is the house belonging to the lord, and the adjoining one is called the *harem*, that is, the ladies' apartment (for the name of *seraglio* is peculiar to the grand seignior); it has also a gallery running round it towards the garden, to which all the windows are turned, and the same number of chambers as the other, but more gay and splendid, both in painting and furniture. The second row of windows is very low, with grates like those of convents; the rooms are all spread with Persian carpets, and raised at one end of them (my chambers are raised at both ends) about 2 ft. This is the sofa, which is laid with a richer sort of carpet, and all round it a sort of couch, raised half a foot, covered with rich silk, according to the fancy or magnificence of the owner; mine is of scarlet cloth, with a gold fringe; round about this are placed, standing against the wall, two rows of cushions, the first very large, and the next little ones; and here the Turks display their greatest magnificence. They are generally brocade, or embroidery of gold wire upon white satin; nothing can look more gay and splendid. These seats are also so convenient and easy, that I believe I shall never endure chairs as long as I live. The rooms are low, which I think no fault; and the ceiling is always of wood, generally inlaid or painted with flowers. They open in many places with folding doors, and serve for cabinets, I think, more conveniently than ours. Between the windows are little arches to set pots of perfume, or baskets of flowers. But what pleases me best is the fashion of having marble fountains in the lower part of the room, which throw up several spouts of water, giving at the same time an agreeable coolness, and a pleasant dashing sound, falling from one basin to another. Some of these are very magnificent. Each house has a bagnio, which consists generally in two or three little rooms, leaded on the top, paved with marble, with basins, cocks of water, and all conveniences for either hot or cold baths.

"You will, perhaps, be surprised at an account so different from what you have been entertained with by the common voyage-writers, who are very fond of speaking of what they don't know. It must be under a very particular character, or on some extraordinary occasion, that a Christian is admitted into the house of a man of quality; and their harems are always forbidden ground. Thus they can only speak of the outside, which makes no great appearance; and the women's apartments are always built backward, removed from sight, and have no other prospect than the gardens, which are enclosed with very high walls. They have none of our parterres in them; but they are planted with high trees, which give an agreeable shade, and, to my fancy, a pleasing view. In the midst of the garden is the *chiosk*, that is, a large room, commonly beautified with a fine fountain in the midst of it. It is raised nine or ten steps, and enclosed with gilded lattices, round which vines, jessamines, and honeysuckles, make a sort of green wall. Large trees are planted round this place, which is the scene of their greatest pleasures, and where the ladies spend most of their hours, employed by their music or embroidery. In the public gardens are public *chiosks*, where people go that are not so well accommodated at home, and drink their coffee, sherbet, &c."

Owing to the houses being mostly built of wood, fires are very frequent at Constantinople, and have sometimes been so very extensive as to threaten destruction to the entire city. The sultan generally attends in person to suppress the efforts made to suppress the fury of the flames. When rebuilt, little or no alteration is ever made in the form of the streets.

It should, however, be observed, as especially marking the character of the Turkish government, that these fires are not always accidental. Indeed, how singular soever the circumstance may appear, there can be no doubt that fires in Constantinople are made to perform the functions of petitions and public meetings in England! In fact, the city has been set on fire, over and over again, for a number of nights together, in order that the grand seignior may be made aware of the deep discontent of his subjects, and of their dissatisfaction with his measures or his favourites, or both. The frequency and continuance of the fires evince their origin; and they have seldom failed to produce a change in the measures of government, and the dismissal or execution of the unpopular favourites! (*Porter*, i. 100.; *Thornton*, i. 187., &c.)

Public baths and *khans* are varieties of public buildings, that are found in most parts of Turkey. The use of the warm bath is universal among persons of both sexes, and all classes. Many of the public baths are handsome, and a few are really magnificent structures. They are mostly built of hewn stone, and comprise several apartments. "On entering one of these establishments, the visiter is conducted into a spacious and lofty hall, lighted from above: round the sides are high and broad benches, on which mattresses and cushions are arranged: here the bather undresses, wraps a napkin about his waist, and puts on a pair of wooden sandals before going into the bathing-room. The first chamber is but moderately warm, and is preparatory to the heat of the inner room, which is vaulted, and receives light from the dome. In the middle of the room is a marble estrade, elevated a few inches: on this the bather stretches himself at full length, and an attendant moulds or kneads the body with his hand for a considerable length of time. After this operation, the bather is conducted into one of the alcoves, or recesses, where there is a basin supplied by pipes with streams of hot and cold water; the body and limbs are thoroughly cleaned by means of friction with a horse-hair bag, and washed and rubbed with a lather of perfumed soap. Here the operation ends: the bather stays a few minutes in the middle chamber, and covers himself with dry cotton napkins: thus prepared, he issues out into the hall, and lies down on his bed for about half an hour." (*Thornton*, ii. 202.)

The baths for ladies are similar, in most respects, to those for the other sex; but are more handsomely fitted up. Lady Mary W. Montague visited one of these baths at Adrianople, and has given an interesting account of it, and of the reception she met with from the Turkish ladies.

*Khans* are a description of public inns, or caravanseras, sometimes built by sultans and munificent individuals, for the public use and accommodation; and sometimes constructed, as in England, on speculation. They are of very various kinds. Exclusive of apartments for the use of travellers, and stables for their horses and camels, the larger khans have rooms in which the goods of merchants may be stored up. These

are generally quadrangular structures, consisting of a series of apartments that open upon a terrace, which surrounds an inner court, and having stables in the back part of the building. The merchants store their goods in separate apartments, or in the rooms which they occupy; the muleteers, with their horses, encamp in the open air in the court, or retire to the stables; and the gateway, by which alone the court and rooms can be entered, being shut up at night, all are as safe as if they were in a fortress. In many towns these are the only taverns. Each khan has its *khanjy* (landlord), a *kakhia* (major-domo), a *khavijy* (coffee-maker), and an *oda-basher* (waiter), who attends to the commands of all the inmates. Sometimes the rooms are furnished, and sometimes not; and frequently, especially in Asiatic Turkey, the apartments are lighted by a window, having paper for glass, opening on the terrace, so that they are, for the most part, dark and gloomy. Food is sometimes, but not generally, furnished in these establishments, the usual method being to have it cooked abroad, and sent in. Coffee, however, is generally prepared in the establishment. (*Missionary Researches*, p. 67.)

Rice is the principal food of the lower orders, but the wealthier classes have a great variety of dishes. The breakfasts of the latter consist of fried eggs, cheese, honey, liban (coagulated milk), &c. The hour of dinner is very early. At entertainments the guests sit cross-legged on sofas or cushions round a low table. In the houses of persons of distinction, handsome ivory spoons (the use of gold or silver for such purpose not being permitted), and small pointed sticks, are laid beside each plate. The dishes are served singly, and in rapid succession, sometimes to the number of 20 or 30: the guests help themselves, sometimes with their spoons, and sometimes with their fingers. Hashed lamb, poached eggs and lemons, stewed fowls, pigeons, &c.; pillaws, roasted meats, a whole lamb stuffed with rice, almonds, &c., are favourite dishes: they are all highly seasoned with salt and spices, and sometimes with onions and garlic. The desert consists of sweetmeats, of which the Turks are exceedingly fond; with coffee, sherbet, fresh honey, grapes, figs, &c. During dinner, nothing is drunk but water or lemonade. The supper is very similar to the dinner. (*Russell's Aleppo*, p. 105, &c.)

The month of Ramadan is observed as a fast; and from dawn till sun-set, during this month, the Turks neither eat nor smoke. But the moment the sun goes down, they eat a hearty meal; and the practice is, for the richer classes to keep the fast, if we may so call it, by sleeping at this season during the day, and sitting up eating and drinking during the greater part of the night! (*Russell*, p. 108.)

The national dress of the Turks is loose and flowing; that of the women, with the exception of the turban, differing but little from that of the men. The shape and colour of the turban serves to distinguish the different orders of the people, and the functions of public officers. Latterly, however, it has become fashionable to imitate the dress and manners of the other European nations; though the former is inconvenient in consequence of the numerous ablutions, the performance of which is enjoined by the Koran.

Every body knows that when females appear in the streets their faces are carefully veiled. And such is the privacy of the harem or women's apartments, that, unless on very rare occasions,

all males are excluded from them except the master of the family. "*Les plus proches parents, tels que les frères, les oncles, les beaux-pères, n'y sont reçus qu'à certaines époques de l'année, c'est-à-dire, dans les deux fêtes de beyram, et à l'occasion des noces, des couches, et de la circoncision des enfants.*" (D'Ohsso, Tab. Générale, iv. 318.)

Polygamy is authorised by the law of the prophet; but is a privilege not often resorted to. If a man marry a woman of equal rank, the marriage of any other wife is frequently guarded against by the marriage contract. In cases of polygamy, the wives are usually either slaves or women of an inferior rank to the husband.

There is a regular slave-market in Constantinople: but slaves in the East, and especially in Turkey, are far from being in the depressed condition we might suppose. The laws of Turkey protect the slave from ill-usage; and, in this respect, the customs of the country are in complete harmony with the laws. "The most docile slave rejects with indignation any order that is not personally given him by his master; and he feels himself placed immeasurably above the level of a free or hired servant. He is as a child of the house; and it is not unusual to see a Turk entertain so strong a predilection for a slave he has purchased, as to prefer him to his own son. He often overloads him with favours, gives him his confidence, and raises his position; and, when the master is powerful, he opens to his slave the path of honour and of public employment. If we seek for any confirmation of the truth of this assertion, let us look around the sultan, and observe who are the most distinguished men within his empire. Khosrow pacha, the old seraskier, the man who has governed and ruled all things in Constantinople, was a slave from the Caucasus, purchased by a Capudan pacha, whose protection has raised him to the highest offices. Halil-pacha, the son-in-law and most distinguished servant of the sultan, and to whom the brightest prospects are open, was a slave to the seraskier." (*Marmont*, Smith's trans., p. 25.)

The Turks are excellent horsemen, and throw the *djerid* or lance with the greatest dexterity and force; but, excepting this exercise and that of wrestling, they indulge in no active exertion. "Their delight is to recline on soft verdure under the shade of trees, and to muse without fixing their attention, lulled by the trickling of a fountain or the murmuring of a rivulet, and inhaling through their pipe a gently enervating vapour. Such pleasures, the highest which the rich can enjoy, are equally within the reach of the artisan or the peasant." (*Thornton*, p. 203.) They never dance themselves, but enjoy public dances, the performers in which, however, are reckoned infamous.

Turkish usages are, in truth, in almost all respects, quite the opposite of ours. "Our close and short dresses, calculated for promptitude of action, appear in their eyes to be wanting both in dignity and modesty. They reverence the beard as the symbol of manhood and the token of independence, but they practise the depilation of the body from motives of cleanliness. In performing their devotions, or on entering a dwelling, they take off their shoes. In inviting a person to approach them, they use what with us is considered a repulsive motion of the hand. In writing they trace the lines from right to left. The master of a house does the honours of the table by serving himself first from the dish: he drinks without noticing the company; and they wish him health when he has finished his draught. They lie down to sleep in their clothes. They

affect a grave and sedate exterior: their amusements are all of the tranquil kind: they confound with folly the noisy expression of gaiety: their utterance is slow and deliberate; they even feel satisfaction in silence: they attach the idea of majesty to slowness of motion: they pass in repose all the moments of life which are not occupied with serious business: they retire early to rest; and they rise before the sun." (*Thornton*, ii. 186.)

**Language, Literature, and Education.**—The principal languages spoken in European Turkey are: 1. The *Turkish* and *Turkic* languages, spoken by the Osmanlis, Tartars, and Yaryks (descendants of the Turcoman settlers in Macedonia). The Turkish language is very much intermixed with Arabic and Persian. It is expressive, soft, and musical, and easy to speak, but not easily written. Its construction is artificial and laboured, and its transpositions are more remote from the natural order of ideas than the Latin or German. 2. The *Arabic*, the written language, used at court and in public worship. 3. The new *Greek* or *Romæic*, which consists of a great many dialects, and differs from the Hellenic, or ancient Greek, still in some measure preserved among the inhabs of the Epirotic mountains, and in the valleys of the Cassiodorus (Suli), though greatly intermixed with foreign words and phrases. 4. The *Slavonic*, in several dialects, spoken by the Slavonians, Bosnians, Croatsians, and Bulgarians. 5. The *Armenian*. 6. *Wallachian*, derived mainly from the Latin, but much intermixed with other languages. 7. The *Arnaute, Skipetorian, or Albanian*, is not, as was formerly supposed, a jargon formed of the admixture of a number of languages, but is a peculiar and distinct language, having regular grammatical forms and an essential character of its own. 8. The *Jewish*, i.e. Hebrew, intermixed with Spanish and Italian words. 9. The *Lingua Franca*.

The Turkish characters are, with some slight difference, the same as the Arabic and Persian, but they have a variety of handwritings. The Arabic *Kud*, in later times *Meschi* (literally the characters used in transcribing), is only used in copying the Koran, and other sacred works. The *Diwan* is the handwriting used in business, letters, public documents, judicial proceedings, diplomatic affairs, official orders, passports, &c. It is written from the right to the left in an oblique direction, especially at the conclusion; all the letters are joined to each other, and twisted together, and the more they are so the more elegant is the writing considered. The *Dsheri* is used in patents, diplomas, inscriptions on mosques, burial-places, and other public edifices; its beauty consists in its oblique direction, upward and downward, and in the words being placed alternately above and below each other. The *Talic* writing was originally borrowed from the Persians, and properly signifies a flying or running hand. It is more pleasing to the eye than the other hands, and is a fine specimen of Oriental calligraphy. The *Kirima*, consisting of disjointed letters, is used in ledgers and registers. The *Sulus* (i.e. treble thick) serves for title-pages, devices, and inscriptions upon coins, &c. There are many more varieties of handwriting, which it is needless to specify. Instead of pens the Turks write with a reed (*Calam, Calamus*), which is cut like our pen, but without a slit. The vowels, which, as in Arabic and Persian, are placed above and below the consonants, are generally omitted in writing (the Koran excepted), which renders the reading difficult to an unpractised eye. There are no marks of punctuation. As they are without tables, they usually write upon the left knee or hand, and instead of moving the hand, they move the paper in the process of writing.

The first printing-press introduced into Turkey was established at Constantinople, in 1576, by Jews, who were, however, prohibited from publishing any Arabic and Turkish works. About 150 years afterwards, Ibrahim, a Hungarian renegade, succeeded in establishing a Turkish press; and it is worthy of remark, that in the Hattî Scheriff authorizing its introduction, the Sultan, Achmet III., felicitates himself that Providence had reserved so great a blessing to illustrate his reign, and to draw down upon his august person the benedictions of his subjects, and of all Mussulmen, to the end of time. (*D'Ossun, Tableau Général*, li. 500.)

Down to 1742, 17 works in 23 volumes had issued from the press. From 1742 until 1755 it was not employed at all, and only at intervals until 1783, when it was attached to the newly-established school of engineers. In the beginning of the present century, it was transferred to Scutari, and attached to the military barracks in that place. The late sultan did much to advance its efficiency and extend its utility. The Turks, however, have a prejudice against printing, originating partly in an apprehension that the Koran should be printed, which they would regard as the highest profanation, and partly in the oppo-

sition of the vast numbers of scribes and copyists, while the general use of the press would throw out of employment, and who, in consequence, take every opportunity to inflame the prejudices of their fellow-subjects against it; but despite these difficulties, the art has made, and is continuing to make, some progress. A few years ago, a government newspaper was established, entitled, *Tables of Events*, which contains the different resolutions and orders of the divan. The *Moniteur Ottoman*, in the French language, also published at Constantinople, consists only of extracts from the former.

No sooner were the Turks converted to Islamism, than they began not only to study the Koran, but also the works of the Arabians, their superiors in civilisation. It is a vulgar prejudice to suppose that the Koran discourages learning; on the contrary, "the ink of the learned and the blood of martyrs are," according to the prophet, "of equal value in the sight of heaven." (See the curious article on *Elm* (science), in the *Bibliothèque Orientale*, l. 629.)

Their favourite studies are law and theology. In the interpretation of the Koran and of the traditions, they follow the Arabian authorities, and most Turkish divines occupy their time with biographies of the prophet, and evidences and reasonings in favour of the Mohammedan religion; these, with the innumerable commentaries on the Koran, form a mass of works which fill the greater part of their libraries. History, poetry, and philosophy, however, are by no means neglected. Hammer, in his elaborate and valuable *History of the Ottoman Empire*, has consulted an immense number of Turkish historians; and in his *History of Ottoman Poetry* (the first volume of which was published at Pesth in 1836) he gives short sketches of the lives of 212 Turkish poets, with specimens of their works. At the same time, however, Hammer acknowledges that the Turks have no genius for original poetry, and that the whole of their poetry consists of translations from, and imitations of, the Arabic and Persian poets, to whom they stand in nearly the same relation that the Roman poets did to the Greek.

Jurisprudence, a favourite pursuit of the Turks, is studied in the works and laws of the learned imams, sheiks, and sultans, the traditional law of the prophet (Sunna). The most remarkable printed collection of Fetwas (decisions) are by Mufti Ishmenli, Abdurrahman, and Mustapha Kodost; the work of the latter, published at Constantinople in 1822, contains several thousand fetwas of 30 muftis in the 18th century. In 1827, there issued from the press 10,000 fetwas, by Abdurrahman, from 1615 to 1676, in 2 vols. folio; and in 1830, 5,400 by Ali Effendi, which, with the collection of Abdulkerrim Effendi, forms a work of high authority.

Turkish literature is particularly rich in collections of bon-mots, puns, proverbs, tales, anecdotes, and even novels; and they possess several encyclopedias, and works upon the history of literature. The first volume of a bibliographical dictionary, in which are enumerated the titles of more than 30,000 different works in the Arabic, Persian, and Turkish languages, has been translated by Flogel, and published by the "Oriental Translation Fund." The reign of Solymán the Magnificent may be considered as the Augustan age of Ottoman literature. This great prince was a liberal patron of the arts and sciences, and of literature and learned men.

Public schools are established in most considerable Turkish towns, and *medreses*, or colleges, with public libraries, are attached to the greater number of the principal mosques. But, owing to the total want of efficient masters, and of good elementary books, the instruction afforded by these establishments is of comparatively little value. In schools the pupils are taught to read and write the first elements of the Turkish language; the class-books being the Koran, and some commentaries upon it. In the medreses, which are the colleges or schools of the ulema, the pupils are instructed in Arabic and Persian, and learn to decipher and write the different sorts of Turkish characters; instruction in a species of philosophy, logic, rhetoric, and morals founded on the Koran; and these, with theology, Turkish law, and a few notions on history and geography, complete the course of study.

"If," says Mr. Thornton, "we call the Turks an illiterate people, it is not because learning is universally neglected by individuals: for, on the contrary, the ulema, or theological lawyers, undergo a long and laborious course of study; the Turkish gentlemen, and all taught certain necessary, and even ornamental, parts of learning; and few children, at least in the capital, are left without some tincture of education. It must be acknowledged, however, that the object of Turkish study, the rhetoric and logic, the philosophy and metaphysics of the dark ages, do in reality only remove men farther from real knowledge. The instruments without which the researches of the acutest natural philosopher would be imperfect, are either entirely unknown in

\* (*Geschichte des Osmanischen Reiches*," 10 vols. 8vo. Pesth 1827-54.)

Turkey, or known only as childish playthings, to excite the admiration of ignorance, or to gratify a vain curiosity. The telescope, the microscope, the electrical machine and other aids to science, are unknown as to their real uses. Even the compass is not universally employed in the navy, nor are its common purposes thoroughly understood. And it may be truly said, that navigation, astronomy, geography, agriculture, chemistry, and all the arts which have been, as it were, created anew since the grand discoveries of the two last centuries, are either unknown, or practised only according to a vicious and antiquated routine." (i. 29.)

The facts and details given by M. Boué show that this statement is as applicable to the present period, as it was to that when it was written, nearly 40 years ago. At this moment (1842) the useful sciences are, without exception, in the most abject state. A school for medicine and surgery transferred, in 1839, to Galata Seral, the school for the guards already alluded to, and a naval school, are the only establishments in which any attempt is made to supply really useful information. But even these are very far behind. The great deficiency, according to Boué, consists in the want of good elementary books; and he justly thinks that it would be of the greatest importance to get the best elementary works on the different branches of science translated into Turkish, either by native Turks, or by foreigners acquainted with the language. In 1839, the late sultan appointed a commission for the establishment of useful institutions; which, among other projects, proposed to found scientific academies on an improved plan, at Constantinople, Smyrna, Adrianople, and other large towns. But nothing of the sort has hitherto been carried into effect.

It must, also, be borne in mind that Turkish schools are mostly attended by boys only. In Turkey education is not considered necessary to a girl; so that by far the greater number of women, knowing little or nothing themselves, can communicate nothing to their children.

*Taxation.* The Turkish exchequer consists of two parts: the *miri*, or public, and the *hazne*, or sultan's private treasury. The former is derived from various sources, of which the principal are—1st, the *haratch*, or poll-tax, imposed, with very few exceptions, on all the males in the empire, not Mohammedans, between the ages of 7 and 60 years. Formerly the tax varied, under different circumstances, from 3 to 14 piastres per individual; but the value of money was greater then than now, and at present it varies, in different provinces and under different circumstances, from 10 to 60 piastres. Various districts compound for the poll-tax, the amount of which is then added to the land-tax. Mussulmen, though exempted from the poll-tax, pay the *avaris*, amounting to 5-8ths of the *haratch*; 2d, the land-tax, of 1-10th of the produce of the estates not subject to military service; 3d, taxes on movables, such as cattle, sheep, and goats, assessed taxes &c.; 4th, customs duties, and octrois; and 5th, the excise upon gunpowder, tobacco, salt, wine, &c. No authentic details have been given of the amount of the *miri*, and the estimates put forth by the best informed writers differ extremely. Probably, however, we shall not be far wrong if we estimate it at about 3,000,000*l.* sterling a year.

The *hazne*, or private revenue of the sultan is derived partly from the imperial domains, or estates belonging to the crown; partly from the sums paid by the pachas and other dignitaries, on their accession to office, from presents from the same parties, on occasion of the bayram, and other public festivals, and from confiscations and inheritances; and partly from the contributions paid by the tributary provinces of Servia, Wallachia, &c. The female branches of the imperial family have their own especial revenues derived from lands appropriated to their use, or from peculiar taxes.

But in addition to the taxes now noticed, the subjects of the Porte are liable to be called upon, at the pleasure of the pachas, for contributions in kind for the maintenance of troops passing from one part of the country to another, for *corvées*, or requisitions of forced labour, and, in time of war, for forced loans, &c. In fact, the pachas and their satellites squeeze out of the people all that they possibly can, without inquiring or caring whether their demands be legal or otherwise. They know right well that if they pay the stated amount of tribute, and secure by bribes and presents the good opinion of those in power, they may fleece the cultivators without let or hindrance. Since the time of Mohammed II., the revenues of Turkey have been farmed, or let to the highest bidder.

Exclusive, too, of the taxes on account of the general government, and the *avaris* of the pachas, the people have to provide for their local and municipal expenses, which are so very heavy as considerably to exceed the amount of the *miri*. (*Idem*, iii. 263, &c.)

The more intelligent Turks have long been sensible that the arbitrary power of the pachas, and especially their *avaris*, or extortions, was the most objectionable

part of their political system, and would, if not redressed, terminate in universal poverty and disaffection. So early as 1690 the inconveniences of the existing order of things had become apparent, and it was then proposed to obviate them by commutating the different taxes on the rays, or cultivators, and their contributions of forced labour and horses, for a single tax, which it should not, in any case, be permitted to exceed. (*Hummer Osmanische Geschichte*, vi. 551.) Nothing, however, was done; and abuses of all sorts have continued to multiply according as the machine of government became relaxed down to the present day. The Hatti Scherif previously alluded to as having been issued on the 3d of Nov. 1839, is principally directed to the obviating of these abuses. But, how indispensable soever, we apprehend it will be found to be wholly impracticable, so long as the present form of government is maintained, to remedy the abuses in question. All the agents of a despot are despots in their peculiar sphere; and though the sultan may be most anxious to suppress abuse, he is neither omnipresent nor omniscient, and it is to be feared that the same means that have hitherto maintained the pachas in power despite their oppressions, will be effectual for the same purpose in the future to come. We could be happy to be able to think otherwise; but our own conviction is that self reform is impossible in Turkey, and that the abuses of which she is the victim, will necessarily increase in number and virulence, till foreign force or domestic violence overthrow the religion and government, of which they are the bitter but legitimate fruits. We subjoin the Hatti Scherif, or Imperial Decree, now alluded to. It is, at all events, a most remarkable document; and the fact of its having issued from a Mohammedan government is not the least singular circumstance in the history of the present times.

"Every one knows that in the beginning of the Ottoman Empire, the glorious precepts of the Koran and the laws of the empire were held as rules always revered, in consequence of which it increased in strength and greatness; and all its subjects, without exception, attained the highest degree of welfare and prosperity. Within the last 150 years a series of events and variety of causes have, from the corruption of the holy code, and the seeds of evil that arose from it, changed the welfare and strength into weakness and poverty. Thus it is that a nation loses all its stability by ceasing to observe its laws. These considerations have constantly presented themselves to our notice, and since the day of our accession to the throne, the public weal, the amelioration of the state of the provinces, and the relief of the people, have never ceased to occupy our thoughts. Bearing in mind the geographical position of the Ottoman empire, the fertility of its soil, the aptitude and intelligence of its population, it is evident that by bringing into operation efficacious means, we may obtain, by the assistance of God, the object we hope to insure, perhaps in the space of a few years. Thus, full of confidence in the Almightiness, and relying on the intercession of our Prophet, we deem it necessary to seek, by new institutions, to procure to the states which compose the Ottoman empire the happiness of a good administration.

"These institutions should have three objects in view—first, to guarantee to our subjects perfect security of life, honour, and property; secondly, the regular levying and assessing of taxes; and thirdly, a regular system for the raising of troops, and fixing the time of their service.

"For, in truth, are not life and honour the most precious of all blessings? What man, however averse his disposition to violent means, can withhold having recourse to them, and thereby injure both the government and his country, when he sees that his rights are in jeopardy? If, on the contrary, he enjoys in this respect full security, he will not stray from the paths of loyalty, and all his actions will tend to increase the prosperity of the government and his country. If there be absence of security, a source of poverty and calamity will be the voice of his prince and country. No one can see about the progress of the public good, absorbed as one remains with the insecurity of his own position. If on the other hand, the citizen looks upon his property as secure, of whatever nature it be, then, full of ardour for his interests, of which for his own contentment he endeavours to enlarge the sphere, thereby to extend that of his enjoyments, he feels every day in his heart the attachment for his prince and for his country grow stronger, as well as his devotedness to their cause. These sentiments in him become the source of the most praiseworthy actions.

"The assessment of regular and fixed taxes is a consideration of vital importance to the state, having in view the maintenance of its territory, can only raise the means necessary for the maintenance of the army by contributions on the people. Although, thanks be to God, the inhabitants of this country have lately been freed from the curse of monopolies, formerly imposed upon them, and which have been a fatal practice still remains in force, although it cannot fail to give rise to the most disastrous consequences—it is that of venal corruption, known under the name of *Hizmet*. According to this system of civil and financial practices, a district is assigned to the arbitrary rule of one individual, but too often notorious for his rapacity, and the most cruel and most insatiable disposition; for, should this farmer of the revenue not be a virtuous man, he will have no other care but that tending to his own interest. It becomes, then, necessary for every member of the Ottoman society to be taxed according to a fixed rate, in proportion to his means and circumstances, and that nothing further should be exacted from him, and that special laws should also fix and limit the expenses of our army and navy.

"Although we have already observed the defence of the country is a most important consideration, it becomes the duty of the inhabitants to support a soldier that object: it becomes essential to establish laws to regulate contingents which each district is to supply, according to the urgency of the moment, and to reduce the time of the military service to four or five years, for it is at the same time doing an injury, and a fatal blow to a mortal blow to agriculture and industry, to take, without regard to the respective populations of each district, from one more, from other fewer men, than they can afford to provide, and it is also reducing the soldiers to despair, and contributing to the depopulation of the country, to retain them all their life in the service. In short, without the different laws of which the necessity has been shown, there is neither strength, riches, happiness, nor tranquillity for the empire, and it has to expect these blessings as soon as these laws come into operation."

"It is therefore that in future the cause of every individual shall be tried publicly, according to our divine laws, after mature inquiry and examination; and till regular sentences have been pronounced, no one shall have it in his power, either secretly or publicly, to put an individual to death, either by poison or by any other means.

"It is not permitted to attack the honour of any individual, unless before a court of justice.

"Every individual shall be allowed to be master of his own property, of whatever kind, and shall be allowed to dispose of it with full liberty, without any obstacle being offered by any one. For instance, the innocent heirs of a criminal shall not forfeit their right to his property, nor shall the property of a criminal be any longer confiscated.

"These imperial concessions extend to all our subjects, of whatever religion or sect they may be, and these advantages they shall, without exception, enjoy.

"Thus we grant full security to the inhabitants of our empire of life, honour, and property, as we are bound to do, according to the text of our holy law.

"As to the other subjects, they are subsequently to be regulated after the decision of the enlightened members of our Council of Justice, the members of which will be increased according to necessity, which is to meet on certain days, which we shall appoint. Our ministers and dignitaries of the empire will assemble to establish laws for the security of life and property, and the assessment of taxes, and every member of these assemblies shall be free to express his opinion and to give his advice.

"Laws concerning the regulation of the military service will be debated at the military council, which will hold its meetings at the palace of the Seraskier.

"As soon as one law is settled, in order that it may be for ever valid, it shall be presented to us, and we shall honour it with our sanction, and to the head thereof we shall affix our imperial seal.

Since the above Hatti Scheriff was issued, the following statement has appeared in the Turkish Gazette:—

"The sultan, ever since his accession, has most ardently desired to signalise his reign by the re-establishment of the Ottoman power on the basis of the common well-being of his subjects. His efforts have on various occasions been crowned with the most signal success: but one fundamental reformation was requisite to crown his labours, and to assure to his people the benefits which he sought to confer upon them. The collection of the revenue has remained up to the present time laden with abuses, oppressive to the subjects, and detrimental to the state. Numerous firmans have been issued—inquiries have taken place; but the sultan, during his late journey through the provinces, having employed himself in examining into the state of the administration, has become convinced that no sensible improvement has been effected, and that more decisive measures are required.

"In order to proceed methodically in this reformation, his highness has ordered an extensive inquiry to be instituted, so as on the one hand to ascertain the abuses in the contributions actually paid by each district, and, on the other, to ascertain the actual disbursements for the army, the marine, the arsenals, and the other military establishments.

"The council of the Porte has, therefore, been assembled in presence of the high functionaries of the state, to deliberate on the best means for carrying the intention of his highness into execution; and after a long debate, it has been resolved as follows:—

"That a table shall be constructed, exhibiting the sums received—1st, for the treasury; 2d, for the Valis and Voivodes; 3d, for the expenses of travelling functionaries; 4th, the amount of contributions in kind to different departments, paid in salt-petre, corn, timber, &c.; 5th, the value of labour to which certain towns and districts were liable, under the denomination of *Angaria* (corvée); 6th, the sums paid for local police, judges, &c.

"That an exact statement or balance-sheet be prepared of the whole revenue, fixed and casual, of the state.

"Henceforward every tax unauthorized by the ancient canon shall be abolished.

"The properties of the high functionaries of the state, whether military or civil, and the persons attached to their services, shall be equally assessed with those of the nation.

"Every exemption from taxation, and every privilege through which the common burdens are avoided, shall be completely impartiality, at a rate of so much per thousand, which shall yearly be settled in the month of March, according to the new ordinance.

"Each individual shall receive a ticket yearly, from the seal of the community, stating the amount of his contributions, and these sums shall be entered in the public register of each municipality.

"Men of recognised probity and intelligence shall be commissioned, at the public expense, to prosecute the necessary inquiries throughout the empire.

"The above regulations shall immediately be carried into execution in the two provinces nearest to the capital, Broussa and Gallipoli, so that the effects and advantages of the change may be observed, and with the least possible delay extended to the remainder of the empire.

"From the date of the execution of this order, the two provinces designated shall be exempt from the payment of the impost termed *Ichtiash* (internal custom).

"The confiscation of private property shall in no instance be allowed. The government shall in no case appropriate to itself the property of individuals, except on the death of persons who have no heirs.

"The government will reserve to itself the right of previous liquidation in the case of a holder of government money dying without sufficient effects to cover his debts.

"These regulations, decreed by the Council of the Porte, have been confirmed by the High Council, and sanctioned by the Imperial Firman.

"As these present institutions have for their object to cause the religion, government, nation, and empire to prosper, we solemnly bind ourselves to do nothing in contravention to them. As a pledge of our promise, it is our determination, after having them deposited in the hall which contains the glorious mantle of the prophet, in presence of all the ulamas and divans of the empire, to abide by these institutions in the name of God, and then order the ulamas and grandees of the empire to take the same solemn oath. After that, he who shall violate these institutions shall be liable, without any regard being paid to his rank, consideration, or credit, to the corresponding punishment to his fault, after once it has been made clear.

"A penal code shall be drawn out to this effect.

"As every functionary receives at present a suitable salary, and as the pay of those who are not well sufficiently satisfied is to be subsequently increased, rigorous laws will be promulgated against the sale of patronage and places under government, which the divine law reprobates, and which is one of the principal causes of the downfall of the empire.

"The above resolutions being a complete renovation of ancient customs, this imperial decree shall be published at Constantinople and in all the provinces of our empire, and shall be communicated

officially to all the ambassadors of friendly powers residing at Constantinople, in order that they may be witnesses to the granting of these institutions, which, if it may please God, are to endure for ever.

"May the Almighty God extend his protection to us all. Let those who may presume to violate the present institutions be the object of divine malediction, and be deprived of happiness now and for ever! Amen."

**Historical Notice.**—Othman, chief of the Oguzian Tartars, is generally accounted the founder of the Turkish empire. On his succeeding his father in 1289, his dominions were comparatively inconsiderable, being confined to the lordship of Sigita, in Bithynia, and a small tract of adjoining territory; but the talent of Othman, and the bravery and zeal of his followers, enabled him to add greatly to his paternal inheritance, and to bequeath the whole of Bithynia and Cappadocia to his son and successor. From this period the tide of Turkish conquest began to roll forward with a force that could not be checked by the feeble resistance of the Greeks. In 1338, the Ottomans first obtained a footing in Europe. In 1362, Amurath, the grandson of Othman, instituted the Janizaries—the first, and for a lengthened period the most powerful, numerous, and best-disciplined standing army established in modern times. The conquests of Timour threatened to subvert the Turkish power; but it soon recovered from the rude shocks it had sustained, and in 1453, Mahomet II. transferred the Constantinople sword in hand, and established himself on the throne of Constantine and Justinian! But the undisturbed possession of all the countries from Mount Amanus to the Danube did not satisfy the restless and insatiable ambition of the Turks. Selim, the grandson of Mahomet II., added Syria and Egypt to the dominions of his ancestors; and Solymán the Magnificent, the contemporary of the Emperor Charles V., and the most accomplished of all the Ottoman princes, conquered the greater part of Hungary, and in the East extended his sway to the Euphrates. At this period, the Turkish empire was, unquestionably, the most powerful in the world. "If you consider," says the historian Knolles, who wrote about two centuries since, "its beginning, its progress, and uninterrupted success, there is nothing in the world more admirable and strange; if the greatness and lustre thereof, nothing more magnificent and glorious; if the power and strength thereof, nothing more dreadful and dangerous; which, wonderfully at nothing but the beauty of itself, and drunk with the pleasant wine of perpetual felicity, holdeth all the rest of the world in scorn." Nor had this mighty power even then reached its greatest height. Solymán was succeeded by other able princes; and the Ottoman arms continued to maintain their ascendancy over those of Christendom until, in 1683, the famous John Sobieski, king of Poland, totally defeated the army employed in the siege of Vienna. This event marked the era of their decline. For a while they continued to oppose the Austrians and Hungarians with doubtful fortune and various success; but the victories of Prince Eugene gave a decisive superiority to the Christians. The Crescent, instead of recovering its former lustre, fell like a star plucked from its place in heaven. Province after province has been dismembered from the empire: the Russians, now its most formidable enemies, have advanced to Adrianople; and, but for the mutual jealousies and animosities of the different Christian states, last century would have witnessed the final extinction of the Ottoman power.

When considered with attention, it does not seem difficult to discover the causes of these apparently anomalous results. The Turks, like their Tartar ancestors, are naturally a brave, patient, and hardy race. After their emigration from central Asia, they were long exposed to all the greatest difficulties and privations. Pressed on all sides by Mongols, Turkmans, Saracens, and Greeks, they could not maintain their footing in Asia Minor without waging incessant hostilities with their neighbours: they were thus early inured to habits of pillage and blood. And, after they embraced the Mohammedan faith, they recovered in the law of the prophet not a licence only, but a command to desolate the earth, and to propagate their religion and empire by violence. The peculiar tenets and doctrines of the Koran made a profound impression on the ferocious, ignorant, and superstitious minds of the Turks, who early became the most zealous apostles of a religion of which implicit faith and unquestionable energy are the vital principles. Their fanaticism knew no bounds. They literally believed that in sword was the key of heaven, and that to fall fighting in defence of the true faith was the most glorious of deaths, and was followed by the largest portion of eternal felicity. Firm and unshaken believers in the doctrine of predestination, assured that no caution could avert, and no dangers accelerate, their inevitable destiny, they met their enemies without fear or apprehension. Tribute, slavery, and death to unbelievers, were the glad tidings of the Arabian prophet; and have been loudly proclaimed by his followers over half the Old World. The

Ottomans did not, like the Crusaders, require an impulse from pontiffs or preachers to stimulate them to engage in the great work of conquest and conversion: the precept was in their law, the principle in their hearts, and the assurance of success in their swords.

To such desperate energies, wielded by a succession of sultans distinguished for various and great ability, the Greeks had nothing to oppose but dispirited troops, and generals destitute alike of courage and capacity. From the age of Justinian the Eastern Empire had been gradually sinking. The emperors were alternately prodigal and avaricious, cruel, profligate, and imbecile: the people were a prey to all the evils of civil and ecclesiastical despotism; their bodies were emaciated by fasting; and their intellectual powers dissipated in theological controversies, alike futile and unintelligible. The total defeat of Bajazet, the great grandson of Othman, afforded an opportunity which, had it been rightly improved, might have enabled the Greeks to expel the Turks from Europe: but the Greeks were totally incapable of profiting either by this or any other event; and the schism of the West, and the factions and wars of France, England, and Germany, deprived them of all foreign assistance, and enabled the Turks to repair their shattered fortunes, and again become the terror and the scourge of Christendom.

But the same cause to which the Turks principally owed their success—the intolerant bigotry and fanaticism of their religion, proved also the principal cause of their decline. It isolated them from the rest of Europe, and taught them to look down with contempt and aversion on the arts, sciences, and attainments of the infidel world. "There is," said they, "but one law, and that law forbids all communication with infidels." The more the surrounding nations have distinguished themselves by their advances in civilization and literature, the more determined have the mass of the Turkish people become to resist their example, to keep within the pale of their own faith, and to despise their progress. The fiery and impetuous zeal by which they were distinguished in the fourteenth and fifteenth centuries has long since subsided; but had it continued to burn with undiminished force, it could no longer have rendered them really formidable. The invention of gunpowder, and the various improvements that have been made in the art of war, have happily opposed an invincible obstacle to the success of multitudes without discipline, and of courage without skill. "Tant qu'il ne s'agissait que de rassembler et de réclamer sous les drapeaux une multitude de soldats animés par le fanatisme, l'avantage fut pour les Ottomans; mais cet avantage disparut quand la guerre appela le concours des sciences humaines, et que le génie, avec ses découvertes, devint le redoutable auxiliaire de la valeur." (Michaud, Hist. des Croisades, v. 384. Ed. 1841.) That fanatical fervour, contempt of danger, and superiority of numbers, which formerly gave so decided a superiority to the Ottoman troops failed to enable them to withstand the science, cool deliberate courage, artillery, and tactics of the troops of Austria and of Russia. The Turks have degenerated both in their civil and military institutions; but their present weakness is to be ascribed more to their not keeping pace with the progress of their neighbours, than to their positive decline. Mighty, confiding, and illiterate, they have experienced all the fatal consequences of ignorance without once suspecting the cause. Resolved to employ no other means than force, they sunk into despondency when it no longer availed; and having now almost abandoned the hope of recovery, they present, to their own astonishment and the mockery of Europe, the *umbra magni nominis*—the mighty shadow of unreal power:—"We effected our conquests," said the mufti to the Baron de Tott, "without any aid from European tactics, and we do not now stand in need of them. Our defeats are not the effects of human forces; they are the chastisement of our crimes; the decree of heaven has reached us, and nothing can avert the wrath of Omnipotence!"

The despotism of the sultans, and the vast extent of their power, have for a lengthened period contributed to accelerate the progress of decline. For a while, however, it was otherwise. The perilous circumstances under which the Turks were originally placed, and the difficulties and dangers with which they had to struggle, obliged their chiefs to exert all their faculties. Having to rule over bold and fanatical subjects, to act as their generals in war and their legislators in peace, they were compelled to practise the military and peaceful virtues; to inspire confidence by superior knowledge and resolution; to attach by kindness; respect by dignity; emulation by discernment in the bestowing of rewards; and discipline and good order by a steady adherence to a uniform system. We do not say that nothing is to be ascribed to the personal character of the sovereign; but if we reflect, that, except in a single instance, a period of nine reigns, and of 264 years, is occupied from the elevation of Othman to that of Solymán, by a series of warlike and able princes (Gibbon, xii. 57.), it must be allowed that some-

thing more than chance, that the necessities of the times had produced this long line of able monarchs.\* No sooner, however, had the tide of Turkish conquest been stopped by the firm resistance of the Hungarians and Germans on the one side, and that of the Persians on the other, than the Ottoman monarchs began rapidly to degenerate. The evil was greatly aggravated by the regulation of Solymán the Magnificent, who, in order to hinder the rebellious and internal divisions that had sometimes occurred, established it as a principle, which has ever since been strictly adhered to, that none of the sultan's sons should be appointed to the command of armies or the government of provinces. This regulation had a fatal effect: instead of being educated, as formerly, in the council or the field, the heirs of royalty and of almost omnipotent power have since been brought up in the slothful luxury of the palace. Shut up constantly in their seraglios, ignorant of public affairs, benumbed by indolence, depraved by the flattery of women, of eunuchs, and of slaves, their minds contracted with their enjoyments, their inclinations were vitiated by their habits, and, when they succeeded to the throne, their government became as vicious, corrupt, and worthless as themselves.

The vast extension of the Turkish empire was another cause of its decline. It multiplied the enemies, not the subjects of the state. To animate the various and discordant asses of people comprised within its widely-extended limits with the same spirit, and give them one common interest, would have required the adoption of a liberal and enlarged system of policy: but to act in this manner was utterly repugnant to the maxims of Ottoman legislators. The inhab. of the conquered provinces who refused to embrace the religion of the prophet were branded with the title of Infidels, and looked upon with aversion and contempt. To associate with such persons on any thing like a footing of equality, or to admit them to the enjoyment of political privileges, was out of the question. They existed only on sufferance; and though their rights were legally defined, their proud and fanatical masters seldom hesitated about trampling them under foot, and subjecting them to every species of insult, extortion, and ill-treatment. Perhaps, however, it is true that the very weight of the tyranny to which the non-Mohammedan portion of the pop. has been subject, has, by subduing their energies and debilitating their minds to the level of slavery, tended to secure the tranquillity of the empire! But, whether this be so or not, it has, at all events, ensured its depopulation, impoverishment, and degradation. Under this miserable government, palaces have been changed into cottages, cities into villages, and freemen into slaves. Sandys, who visited the Turkish empire early in the 17th century, when it was comparatively flourishing and vigorous, has described the unhappy state of the regions subject to its destructive despotism, with a truth and force of eloquence that will not speedily be surpassed: "These countries, once so glorious and famous for their happy estate, are now, through vice and ingratitude, become the most deplored spectacles of extreme misery: the wild beasts of mankind having broken in upon them, and rooted out their civillitie, and the pride of a sterner and barbarous tyrant possessing the thrones of ancient and just dominion: who, aiming only at the height of greatness and sensuality, hath, in tract of time, reduced so great and goodly a part of the world to that lamentable distresse and servitude under which (to the astonishment of the understanding beholders) it now faints and groineth. Those rich lands at this present remaine waste and overgrown with bushes, receptacles of wild beasts, of thieves, and murderers; large territories dispeopled or thinly inhabited; goodly cities made desolate; sumptuous buildings become ruines; glorious temples either subverted or prostituted to impietie; true religion discomenanced and oppressed; all nobilitie extinguished; no light of learning permitted; the cherishes of violence and rapine insulting over all, and leaving no security, save to an abject mind and unlookt on povertie." (Preface, ed. of 1637.)

Such is the government which the great powers of Christendom, including, we are sorry to say, England, profess themselves desirous to maintain in all its integrity! We hardly, however, think that it is destined to a much longer endurance; and, happily, into whatever hands it may fall, there cannot be so much as the shadow of a doubt that the overthrow of the Turkish government and power will be productive of the greatest possible advantage to the interests of humanity.

TURNHOUT, a town of Belgium, prov. Antwerp, cap. arrond. In a wide heathy distr. 25 m. E.N.E. Antwerp. Pop., in 1836, 12,900. (*Hesseling*). It is well built, and has manufactures of cutlery, linen cloths, lace, carpets, and oil, with bleaching and dyeing establishments, tanneries, brick and tile factories, &c. It sends 3 deputies to the states of the prov.

TUSCANY (GRAND DUCHY OF), (an. *Etruria*),

\* Some of the foregoing statements have been borrowed from the notice of the Increase and Decline of the Turkish Power, in the translation of Malte-Brun, written by the author of this article.

a state of N. and Central Italy, being the third in rank in that peninsula, principally between lat. 43° and 44° N. and the 10th and 12th degs. of E. long.: the main body of the country has N.E. and S. the Papal States, from which it is mostly shut off by the Apennines, W. the Mediterranean, here called the Tyrrhene or Tuscan Sea, and N.W. the duchies of Lucca and Modena; but exclusive of the above, it has some detached portions of territory collectively termed Lunigiana, surrounded by the dominions of Lucca, Modena, Parma, and Sardinia. The greatest length of the compact portion of the Grand Duchy from N. to S. is 165 m.; greatest breadth 135 m. The area and pop. are estimated as follow:—

Provinces.	Area in sq. m.	Pop. in 1836.	Chief towns.
Florentino	2,150	671,857	Florence.
Pisano	1,278	329,182	Pisa.
Senese	465	159,651	Sienna.
Areolino	1,945	228,416	Arezzo.
Grossetano	2,535	67,579	Grosseto.
Total	8,381 *	1,436,785	

The main chain of the Apennines, where it forms the boundary between Tuscany and the Papal dominions, lies wholly within the former. It is neither so lofty nor so rugged as in other parts of Italy, seldom rising to 4,000 ft.; though one summit, Boscolungo, attains to an elevation of 4,178 ft. The principal passes across the Apennines in this part are those of Fumarolo, Pietra Mala, and Pontremoli, by which last, Tuscan Lunigiana communicates with Parma. The principal valley is that of the Arno, which comprises about 1-6th part of the entire surface of the duchy. The Arno, one of the secondary rivers of Italy, rises in Monte Falterona, near Prato Vecchio; and after running at first S.E., and then N.W., it flows generally W. to its mouth in the Mediterranean, 6 m. W. Pisa, after a course of about 120 m. Its principal tributaries are the Chiana Canal, the Sieve, Ombrone di Pistoja, &c.; Florence, Empoli, and Pisa, are on its banks. It is usually navigable to Florence, but the navigation is bad, and in the early part of the 17th century a canal was formed from Pisa to Leghorn, avoiding the mouth of the river. The greater Ombrone (ent. *Umbro*), drains the S. part of the country: the Serchio enters from Lucca; and the Chiana and Tiber rise in Tuscany, as do nearly all the rivers of the N. part of the Papal dominions. There are no lakes of any consequence: those of Castiglione, now in process of filling up, Orbitello, Burano, &c., are mere lagoons or arms of the sea. Few countries are better furnished with streams for irrigation, and the greater part of Tuscany is so fertile and diversified with hill and dale as to be one of the most pleasant regions of Italy. Mr. Maclaren says, "Florence lies in the centre of a magnificent basin. From the tower of the cathedral the eye ranges over a breadth of 30 m., which seems one vast grove, diversified with wooded hills of moderate height, and yet so thickly studded with glittering villages, hamlets, villas, and houses, that if Florence were a larger town, the whole country, back to the mountains, might be considered as its suburbs. The landscape has all the luxuriant beauty of the view from Richmond Hill, with the grandeur of mountain scenery superadded. With the addition of a sheet of water, the scene would reach the perfection of rural beauty. The Arno is, indeed, much finer than the Tiber; but it wants volume suitable to the grand scale of the scenery. It is but a thread in the rich valley through which it meanders." (*Notes on Italy*, 185-6.)

Along the coast there is a succession of marshy plains, and all the S.W. part of Tuscany is occupied by the Maremme, an undulating and pestiferous tract of country, similar, in most respects, to the Campagna di Roma. The Maremma, which has long been the abode of desolation, were in remote antiquity among the richest and best peopled portions of Italy, and the seat of many of the chief cities of Etruria. For a lengthened period the drainage and improvement of this neglected tract has been a principal object of the reigning dynasty. The present Grand Duke, in particular, has prosecuted this great work with singular vigour; and from 1829 to 1832, he is said to have expended 200,000*l.* sterling of his own property in hydraulic works, roads, bridges, buildings, &c., in the Maremme. (*Bouring's Report*, p. 49.)

The Lake of Castiglione had, in 1836, been already half drained, as well as other stagnant pools; and the river Cornia has been diverted to fill up by its deposits the marshes of Piombino. Large tracts in the Maremme belong to an impoverished nobility, whose profit from the land is principally derived from wood-cutting, and the pasturage of sheep and goats, at from 10*d.* to 1*s.* 4*d.* a head during the winter season, or of buffaloes and other cattle. But the government has lately purchased up many of these estates, and frequently grants small tracts

of land to those who agree to build houses and settle on them; or lets out farms at a low ground rent, which is easily raised by the tenant from the sale of the wood he clears from the estate. At Borghieri, Count Gherardesci has introduced the cultivation of olives, vines, and mulberry trees to a great extent; and good crops of wheat are now grown in many places where a few years since a few wandering fishermen with difficulty obtained a scanty subsistence.

But it is not in the Maremme only that important drainages have been effected in Tuscany. The Grand Duke Leopold I. in 1788 began the canal which unites the Chiana with the Upper Arno, by which a large extent of very fertile land in the Val di Chiana, formerly a pestiferous marsh, has been rendered productive and salubrious. The canal brings down a large quantity of river deposit, particularly during floods; and between 1816 and 1833, 3,000 quadrati, or nearly 4 sq. m. of cultivable land, were acquired in this manner. (*Bouring's Rep.* 10. 47—51.)

The climate of the Apennines is severe in winter, when the snow often lies for a month together. But in the valleys the winter is but imperfectly defined; the snow seldom lies for more than a day at a time; and vegetation is scarcely interrupted. The average temperature of the year at Florence is about 59° Fahr. (*Berghaus, Allg. Länder, &c.*) The *libeccio* and *scirocco* are occasionally prevalent, but the latter is much less annoying than at Naples. Putrid and intermittent fevers, with dropsies, scurvy, &c., as in the Campagna di Roma, are common in the marshes of Pisa and the Maremme, particularly in the autumn, when these tracts are deserted by almost all their inhabs. But the other parts of the country are salubrious, and often favourable to longevity: in the prov. of Arezzo, during the decennial period, ending with 1835, the annual deaths sometimes did not exceed 1 in 40 of the pop., and were never so high as 1 in 36. (*Bouring's Rep.*)

The geological rocks of the great Apennines, in this part of Italy, are chiefly serpyntine, talc, mica, slate, and quartz: gneiss, which is here absent, appears in the Maremme. The marble found near Serravalle is little inferior to that of Carrara. Tertiary deposits are frequent, consisting of sandstone, marl, coarse limestone, chalk, and gypsum; and in the Vale of the Arno, the country about Sienna, &c., they contain numerous fossil remains. A great variety of chalybeate, sulphurous, and other springs exist in the Maremme and elsewhere, and one of the Apennines, the *Monte di Fo*, is a volcano scarcely yet extinct; since, at intervals, it continues to send forth smoke, &c. Many other places exhibit distinct traces of volcanic agency. (*Huffman's Europa*; *Stein; Schults, &c.*)

*Land and Produce.*—Of 6,138,993 quadrati of land comprised in the Grand Duchy, according to a government survey, in 1834, 1,835,636 were estimated to be in pasture; 1,661,718 in forests; 997,672 arable; 644,285 in vineyards; 462,184 under vines and olives; 361,308 in chestnut woods, and the rest in meadow lands, buildings, roads, &c. The same survey gives, in all, 162,067 separate properties, including from 50,000 to 60,000 farms: there are, in all, about 122,000 landed proprietors. Except in the Maremme, properties are mostly small; and the metayer system, by which the produce of the soil is divided between the proprietor and the cultivator, is generally prevalent. In this system the proprietor supplies the capital, and the cultivator the labour and utensils; the produce is equally divided between them, even as regards the profits arising from the sale of cattle. The cultivator is only obliged to supply the labour required in ordinary cultivation. Should the proprietor desire to make new plantations, or reclaim waste land, the expense falls wholly upon him, and he is obliged to pay the cultivator wages for extra work. The manure and seed is supplied at their joint expense; but the proprietor is obliged to furnish the cultivator with as much of the latter as is necessary for his support. On all occasions it is the proprietor who reclaims or disburbs the marshes or the sale or the purchase of cattle. The contract, which is not in writing, holds good only for a year, and the proprietor may at its termination discharge his cultivators; but in such a case he loses all claim upon them should their accounts be in arrear; and in general good tenants continue on the same estate from generation to generation.

The cultivators do not reside in villages, but in isolated houses, or cottages in the centre of their farms. They seldom see their neighbours, except on holidays or at church. A good cultivator rarely goes to market; he neither buys nor sells; the great recommendation of the metayer system being that his land is frequently farmed with all he wants. The same field is frequently, at the same time, under different crops; and there is, in fact, but little division of labour either in husbandry or anything else.

The coloni, or occupiers, seldom sink into absolute poverty; but, on the other hand, they as seldom rise to

\* The islands of Elba, Pianosa, Gorgona, Palmaria, Troja and Moliore, in the Mediterranean, belong to the prov. of Pisa; and those of Ugento, Monte Crisio, Ugenti, &c., to the prov. of Grosseto.

any thing like wealth or comfort: and, though they may nearly all be above want, they enjoy extremely few of the luxuries and conveniences of life, other than those conferred on them by the bounty of nature. They are at once poor, ignorant, and incapable of vigorous and systematic exertion. "The metayer," says Sismondi, "lives from hand to mouth. He has rarely any corn in store, and still more rarely any oil or wine. He sells his oil when in the press, and his wine when in the vat. He has no provision of salt meat, butter, cheese, leguminous plants, &c. His kitchen utensils are of earthenware; and the furniture of his cottage consists only of a table, and some wooden chairs, one or two boxes, and a miserable bed, on which father, mother, and children sleep. Hence, as they possess nothing, they would in a bad year die of hunger, if they were not assisted by the proprietors, who rarely refuse making them a loan on security of the ensuing crop. Their debts are paid after the vintage, but before winter is over new ones are contracted. Of ten metayers, there is hardly one who owes nothing to his master. Such is their idleness, that a hired labourer will execute three times as much work in a day as a metayer." (*Tableau de l'Agriculture Toscane*, pp. 212-216.)

"I had more than once occasion," says Bowring, "to see 4 generations inhabiting the same cottage; but the last had not added a particle of knowledge to the ignorance of the first: the same gross superstitions; the same prejudices against books; the same unwillingness to introduce any species of improvement; the same reference to ancestral usages. In innumerable cases, families have occupied the same farms for hundreds of years, without adding a farthing to their wealth or a fragment to their knowledge." The metayer system of agriculture is, however, not only the oldest, but the only one that is understood in Tuscany. At Pistoia, indeed, and some other places, the system of letting the land to the cultivator at a fixed rent has been partially adopted; but it has taken no deep root, and the *mezzadria* has been introducing itself also with the extension of cultivation into the Maremma. Any change in the existing mode of occupancy must, therefore, be temporary.

Every species of cultivation, except that of wheat, vines, and olives, is neglected. Forests have been destroyed or badly managed; and the proper treatment of meadow lands is wholly unknown. All kinds of produce not suitable for direct consumption are but little esteemed. Mulberry trees, which answer admirably well, are not in favour; and the rearing of silkworms, though carried on more or less in the house of every cultivator, is reckoned of inferior importance, and is abandoned to the females. The produce of silk, therefore, is much less than it might be; and the same may be said of most articles of export.

The culture of the corn, and other articles required for home consumption is, however, conducted with the utmost care and attention. The hill sides are formed into a succession of terraces; and a small extent of land of very moderate fertility suffices for the support of a family of 10 or 15 individuals. "The Val d'Arno," says Mr. Maclaren, "is cultivated like a garden. Much of the land is in drills, about 2 ft. wide and 1 ft. deep, planted with maize, &c.; and about every 100 yards there is a neatly cut drain bordered by a row of poplars to serve as vine props. The rich bottom land is skirted with low hills, which are also carefully cultivated, and bear great numbers of olives. Though not a foot of land be wasted, and not a tree grows which has not been planted by human hands for use or ornament, the whole valley, from the bare hills on one side to those on the other, looks like a forest." (*Notes on Italy*, 185.)

But, as already seen, the appearance of the country furnishes no sure criterion of the condition of its inhabitants. The land is split into very small portions; and here, as in most other parts of Italy,

"The poor inhabitant beholds in vain  
The redd'ning orange and the swelling grain;  
Joyless he sees the growing oils and wines,  
And in the myrtle's fragrant shade repines:  
Starves in the midst of Nature's bounty curst,  
And in the laden vineyard dies for thirst."

M. de Chateaufieux states that the occupiers in the Val d'Arno are "never able to lay by any thing as a reserve against unfavourable years. On entering their houses, we find a total want of all the conveniences of life, a table more than frugal, and a general appearance of privation." (*Eng. Trans.*, p. 78.) It is true that, owing to the mildness of the climate, the temperance and contented disposition of the people, poverty is here productive of much less inconvenience than in England or less favourably situated countries. It appears, indeed, to have had but little influence over the increase of population. In 1801, for example, the pop. of Tuscany amounted to only 1,096,641, whereas, as already seen, it amounted in 1836 to 1,486,785.

Corn is the principal object of culture; but the quantity grown is inadequate to the consumption, and a good

deal is imported at Leghorn from the Black Sea and elsewhere. Maize, wheat, barley, and rye, are the grains principally raised. The husbandry is not uniformly the same, but, according to Chateaufieux, it is generally under a 5 years' rotation as follows:—1st, maize, French beans, peas, or other vegetables, manured; 2d, wheat; 3d, winter beans; 4th, wheat; 5th, natural clover, sown after wheat in the spring, and followed by *sorgho*, a large species of parsnip. The terrace cultivation absorbs a good deal of capital, time, and labour. Walls of turf, sod, and sometimes stone, are raised in succession along the sides of the hills, and support the soil brought down by the rains. The sunny sides of the hills thus terraced are chosen for vines; the shady sides for olive trees. The culture of olives and vines is not conducted on any scientific principle; but, from the care bestowed on their produce, the oil and wines of Tuscany hold a respectable rank. The best oil is raised near Pisa, Pescia, and Calci. The wines of Tuscany were formerly very celebrated: they include the Alaticco, and the red muscadell wine of Montepulciano, which last was, with excusable partiality, preferred by Redit to all other wines:

"Montepulciano d'ogni vino è il re."

*Bacco in Toscana*

Two centuries ago the wines of Chianti were well known in England: those of Caregnano, Monte Catini, Ponte a Moriano, &c. have some reputation. The annual produce of silk is estimated at about 250,000 lbs.

Out of five years' crops in the Val d'Arno it will be seen that only one is for cattle, the rearing of which is but a subordinate branch of Tuscan husbandry. Except the herds and flocks belonging to the grand duke and a few other large proprietors, in general only as many are kept as are indispensable for manuring the fields and other agricultural purposes. In 1832, the cattle, including buffaloes, were estimated at about 356,000, and the sheep at 600,000 head. The oxen are mostly of the Hungarian breed; they are not so much used for draught as buffaloes. From 60,000 to 70,000 sheep are pastured in the Maremma from Oct. to May, and in the Apennines the rest of the year. The wool of the Tuscan sheep is coarse, and little used for any but home manufactures; though during the short period of the French domination there was a considerable introduction of Merino flocks. Cheese made of the ewes' milk is consumed in the country, but it is of very inferior quality. The horses of the grand duchy are among the worst in Europe, small, weak, and ill-shaped; and though some attempts have been made to improve the breed, we believe the success has been only very partial. On the other hand, however, the Tuscan asses are the strongest and finest in Italy. Goats, being easily fed, are kept in large numbers in most districts; and the *ricotta* cheeses are made of their milk. Pigs are very abundant in the provs. of Siena and Grosseto, where they roam at large in the oak woods of the Maremma; and poultry and bees are pretty numerous.

It is a curious fact that, notwithstanding the houses of the peasants are so miserably ill-furnished, they are themselves of a very superior description. "In no country are the peasantry so well lodged. Probably half or more of their houses have been rebuilt within the last 60 years, and the remainder have been improved. It is reckoned, taking one house with another, they must have cost 1,000 crowns or 5,000 fr. each, and the average value of a farm is 2,000 crowns. The living of the peasantry does not correspond to the luxury of their habitations: it is wholesome, though frugal. In most of the provs. bread is a mixture of rye, barley, and maize, with a little wheat; in some places, however, it is of pure wheat. Next to bread, beans form the principal nourishment of the cultivators. They drink but little wine; more frequently aquarello or piquetto. To eat fresh meat once a week is considered a luxury; and the poorest are satisfied with a piece of bacon. Salt fish is a good deal eaten. The import of salt cod into Tuscany exceeds 1,000,000 fr. a year." (*Bowring's Rep.* p. 44.) The day labourer gets on an average 10d. a day for 11 hours' work in the summer, and 8 hours in winter. An English gentleman farming an estate of 40 acres near Florence stated to Dr. Bowring that the value of its gross produce amounted to about 315*l.* a year, which, after deducting the half share of the contadino and the expenses either shared by him or falling solely upon the proprietor, with casual expenses, left him a net profit of about 2*l.* 10*s.* per acre, or not quite 3*l.* per cent. interest on his outlay. (See *Report*, pp. 46, 47.)

Tuscany has a great variety of mines, which were formerly extensively wrought; but many of these have been abandoned. The principal are the iron mines of Elba (which see, I. 754.) Copper is obtained at Monte Catini, Montieri, &c.; cinnamon, lead, silver, &c. in different places. During a recent decennial period 413,000 lbs. a year of sulphur were produced at Pertita; and alum, nitre, various kinds of marble, &c. are found in different parts of the Maremma. But the most remark-

able mineral product is borax, obtained from a collection of lagoons, unique in Europe, if not in the world, and spread over a surface of about 30 sq. m. at and near M. Cerboli, about 15 m. S. by W. Volterra. "As you approach the lagoons, the earth seems to pour out boiling water as if from volcanoes of various sizes. In a variety of soil, but principally of chalk and sand. The heat in the immediate vicinity is intolerable, and you are drenched by the vapour which impregnates the atmosphere with a strong and somewhat sulphurous smell. The ground, which burns and shakes beneath your feet, is covered with crystallisations of sulphur and other minerals. The vapours break forth violently in different parts of the mountain recesses: they only produce boracic acid, when they burst with a fierce explosion. In these spots artificial lagoons are formed by the introduction of the mountain streams. The hot vapour keeps the water perpetually boiling, and after it has received its impregnation during 24 hours at the most elevated lagoon, the contents are allowed to descend to the second lagoon, where a second impregnation takes place, and then the third, and so forth, till it reaches the lowest receptacle; and having thus passed through from six to eight lagoons it has gathered half per cent. of the boracic acid. It is then transferred to the reservoirs, and thence, after a few hours' rest, to the evaporating pans, where the hot vapour concentrates the strength of the acid, by passing under shallow leaden vessels from the boiling fountains above. There are from 10 to 20 pans, in each of which the concentration becomes greater at its descent, till it passes to the crystallizing vessel; from whence it is carried to the drying rooms, when after 2 or 3 hours it is ready to be packed for exportation. There are in all 9 establishments. The whole amount produced varies from 7,000 to 8,000 lbs. of 12 oz. a day. The borax-lagoons have been brought into their present profitable action within a very few years. In 1833, only about 650,000 Tuscan lbs. were obtained; in 1836, 2,500,000 lbs. But the produce does not appear susceptible of much extension, as the whole of the water is now turned to account." (*Report*, pp. 36-38.) The territory around Volterra is rich in springs, and the spring salt works employ about 90 labourers, and produce nearly 18,000,000 lbs. of salt a-year, exclusive of the produce of Elba.

Among the manufactures, one of the principal is that of straw plait, so large an export from Leghorn. It is made with the straw of the beardless wheat, grown on soil the poorness of which renders the reed white, and is cut before it be quite ripe. Small patches of ground are chosen for its culture, on calcareous hills, and it is never manured. The seed is sown very thick; and Chateaufieux was assured that a crop of two acres would supply straw sufficient for the whole hat manufacture of Tuscany. (*Letters*, p. 75.) This manufacture employs a vast number of hands in Florence, Prato, and in all the districts from Florence to Pistoja on one side, and to Pisa on the other. It is estimated that between Florence and Prato only there are fifty manufactories; besides which, the females of nearly all the *contadini* families in the Val d'Arno employ themselves more or less, in making straw hats. "This branch of industry has lately diminished; but when Chateaufieux wrote, it brought 'an annual return of 3,000,000 fr. to the females of the country, for the men have no concern in it. Every young woman, for a few pence, purchases the straw she has occasion for; she exerts her talent to braid it as fine as possible; and sells, for her own profit, the hats she has made; the money which she thus earns at length forming her dower. Each individual in a family can earn from 30 to 40 sous (15d. to 20d.) a day in plaiting straw, while they can hire a poor woman from the Apennines for 8 or 10 sous (4d. or 5d.) to do the domestic work." (*Id.* pp. 74, 75.) From 3,000 to 4,000 looms in Florence, 600 to 700 in Sienna, and some at Prato are engaged in the silk manufacture; and, in many parts of Tuscany, there are steam mills for the chain and tram. At Sienna, Prato, &c. are several factories for woollens, including *berretti* or red woollen caps, in imitation of those of Tums. Pistoja has extensive iron works, hardware factories, and paper mills; Prato, many copper foundries; and at Folonica nearly all the iron of Elba is smelted and wrought; carpets at Florence; leather and rope at Leghorn; marble and alabaster goods at Volterra, &c.; glass, earthenware, hats, hempen and linen fabrics are the other articles principally manufactured. At Prato, which town may give a fair average, the wages of a working man, in most trades, may be about 24 pauls, or 1s. a day; few earn more than 3 pauls (15d.), or less than 2 pauls (10d.). The retail prices of food are, bread about 4d. per lb.; mutton and beef, 14d. to 24d. per lb.; oil, 34d. per lb.; *vino-ordinaire*, 24d. to 5d. for about three bottles, &c. (*Booring's Report*.)

The exports are principally oil, charcoal, borax, straw plait and hats, cork, rags, potash, tanned hides, marble, coral, woollen caps for the Levant, timber, paper, soap, tartar, &c. the imports, colonial produce, spices and dye stuffs, manufactured goods, hardware and earthen-

ware, salted fish, &c. Leghorn (which see *Ante*, 160.) engrosses almost the whole foreign trade of the country. Accounts are kept in *lire* (= about 8d.), of 20 *solidi*, and 240 *denari* each. The paulo = 14 lire; the pezza = 53 lire. The Tuscan lb. = about 12 oz. troy. The staja, for corn, &c. = 3-4ths bushel; the moggio = 25 staja. The barile (of wine) = 10 imp. galls.; (of oil) = 7½ galls. The braccio = about 2 ft.; the seccata of 660 per picche = about an acre.

The Government is an absolute monarchy, mildly exercised, being, in a practical point of view, not only the best in Italy, but one of the least exceptionable in Europe. The Grand Duke is assisted by a council of 4 ministers. Justice is usually administered by the syndics in the small towns and villages, from whose decision appeal may be made to the *vicario* of the canton. There are courts of primary jurisdiction in Florence, Leghorn, and Pistoja, from which appeal lies to the highest court, the *ruola* in Florence. Crime is rare, and is mostly confined to petty frauds and robberies. The civil legislation is far more defective than the criminal; and is often dilatory in the extreme. The total number of criminals and petty offenders convicted before the Tuscan courts in 1835 amounted to 1,320. All the inhab., except a few Jews, Protestants, Greek communicants in Leghorn, &c., are R. Catholics, being subordinate to the three archbishops of Florence, Pisa, and Sienna, and seventeen bishops. Education is almost exclusively in the hands of the ecclesiastics, but is notwithstanding better conducted than in most parts of Italy, especially the Papal States and the kingdom of Naples. There are universities in Pisa and Sienna; the former, in 1836, was attended by 545 students, and the latter by 254; and in Florence the famous schools of the Scolopi are attended by upwards of 1,000 students. Numerous other superior schools and many learned societies exist, and no better evidence can be given of the increase of knowledge than the fact that in 1814 there were but 6 printing presses in Florence, whereas in 1836 they amounted to 35. In 1835, about 21,300 children were attending the public schools. "Since 1830," says the *Journ. of Educ.* No. xvi., "much has been done to forward elementary education, though no general system be established. In the towns there are very good gratuitous schools, and Lancasterian schools have been established in various parts of the country. Holiday schools have also begun to be established." No. iii. of this *Journ.* has a very full account of the state of education, &c., in Tuscany.

Tuscany, as compared with its population and resources, has the smallest military force of any European state: it consists altogether of about 6,000 men, of whom only 4,500 are usually under arms. Military service is obligatory upon all classes, recruits being chosen by lot. The army is maintained on an economical footing, and officers are retained on duty till advanced in years, to avoid a multiplicity of pensions. The naval force is insignificant; there being only one ship of war to guard the port of Leghorn. (*Quatinot, Italie et ses Forces Milit.* pp. 290-292.)

The roads, bridges, canals, &c. of Tuscany are well kept; the roads, in particular, are so good, that the conveyance of goods by the rivers and canals is comparatively little resorted to. Between Florence and Leghorn there is a daily post; between the other towns about two posts a week. Mendicity is prohibited by law; but there are numerous and richly endowed charitable institutions. Workhouses exist at Florence, Sienna, and Arezzo, supported partly by the state, and partly by voluntary contributions and the labour of the inmates. Pisa and Sienna have deaf-and-dumb institutions; and, together with Florence, Leghorn, and Pistoja, establishments at which orphans are taught different trades. Several institutions distribute food, bedding, clothing, and working tools to persons in want, and at Prato is one which makes annual grants for study, and furnishes loans for various purposes. Government pawn-banks and savings-banks are established in the principal towns; the latter paying 3½ per cent on deposits up to a certain amount. The public revenue, derived principally from the government rents, custom duties, stamps, salt monopoly, lottery, tobacco duties, patents for carrying arms, fees, honours, &c., amounted in 1830 to 25,104,898 Tuscan lire; and the expenditure to 23,078,029 lire. In every respect we may consider Tuscany as the most flourishing state of the Italian peninsula. At two distant epochs, in remote antiquity, and at the revival of science and commerce in the middle ages, Tuscany has been the seat of the highest degree of civilization in Europe. The Tuscans of the present day are admitted generally to excel the other inhabs. of Italy in their taste for the fine arts, and the polish of their manners; and the Italian, or, as it is sometimes called, *Lingua Toscana*, is here spoken in the greatest purity and perfection. Even within this limited territory, there are, however, no fewer than five different dialects—the Florentine, Senese, Pistojan, Pisan, and Areline. The best Italian is said to be spoken in Sienna. History. Etruria was finally conquered by the Romans

about anno 280 A.C. After the fall of the Western Empire, it successively belonged to the Goths and the Lombards, by the last of whom it was erected into a duchy. Charlemagne conquered Tuscany with the rest of the Lombard dominions; but under his feeble successors its marquises made their government hereditary and independent. The Tuscan territories were afterwards divided, in the 12th and 13th centuries, among the famous republics of Florence, Pisa, and Sienna; but these were re-united in 1531 into a duchy under Alexander de Medici, in whose family it continued till its extinction in 1737, when it fell into the hands of the Ho. of Austria. In 1801, by the treaty of Lunéville, Napoleon erected it into the kingdom of Etruria for the Prince of Parma; but in 1808 it was incorporated with the French empire, and subdivided into the depts. Arno, Mediterranean, and Ombrone. Since 1814 it has reverted to Austria, and is now governed by one of the Austrian archdukes. (*Bouring's Rep. or the Statistics of Tuscany; Ram-poldi; Scerristori, Statist. d'Italia; Sismondi, Agriculture Toscane; Chateaubriand, &c.*)

TUY (an. *Tudā ad Fines*), a fortified town of Spain, in Galicia, cap. prov., on the Minho, which separates it from the Portuguese territory, 57 m. S. by W. Saint Jago. Pop. about 7,000. (*Mifano.*) It stands on a height surrounded by several small rivulets, and has always been a fortress of some strength, and a key of Spain on this side. It is regularly laid out, and has well paved and clean streets, several squares and bridges, a cathedral, several hospitals and convents, a seminary, college, and 2 barracks. Its principal manufacture is of table linen, in which its inhabitants trade with Portugal; but it also produces hats, leather, liqueurs, &c. Its climate is rendered unhealthy by adjacent marshes.

TWEED, one of the principal rivers of Scotland, forming, in the lower part of its course, the boundary between Scotland and England, has its sources on the E. side of Errickstane hill, about 6 m. from Moffat. Its course is first N.E. to Peebles; then E. with a little inclination to the S. to Melrose; it next passes Coldstream and Kelso; and, pursuing a N. easterly direction, falls into the sea at Berwick. The descent from the source of the Tweed to Peebles is 1,000 ft., and thence to Berwick about 500 ft. more. (*New Statistical Account of Scotland*, p. 2.) The waters of the Tweed are particularly pure and limpid. The first part of its course is through a fine pastoral country, especially celebrated in Scottish song, and the latter through one that is rich and well cultivated. Including windings, its length is reckoned at rather more than 100 m. Notwithstanding it conveys a large body of water to the sea, it is not navigable for any considerable distance. The salmon fisheries on the Tweed are of very considerable value and importance; being, in this respect, second only to those of the Tay. The fish is almost all conveyed, packed in ice, to London.

Among its principal tributaries is the Etterick, which, flowing from the S. parts of Selkirkshire, joins it at the Eldon Hills. A little lower down it receives the Gala, from Mid Lothian, and the Leader from the borders of East Lothian. The Tweed rises in Roxburghshire, on the confines of Dumfriesshire; and flowing N.E., and receiving several tributaries, it falls into the Tweed at Kelso. The Till rises in Northumberland, near Ingram, and, pursuing a N. westerly course, falls into the Tweed at Tilmouth. Near Berwick, the Tweed receives the Adder, a considerable river, formed by the junction of the Blackadder and Whiteadder, having their sources in the Lammermoor hills. The basin of the Tweed is estimated at about 1,870 sq. m.

TWENTY-FOUR PERGUNNAHS, a district of British India, presid. and prov. Bengal, between lat. 21° 30' and 23° N., and long. 88° and 90° E., having N. Nuddea, E. Jessore, W. the districts of Calcutta, Hooghly, and Midnapore, from which it is divided by the Hooghly river, and S. the Bay of Bengal. Area, 2,630 sq. m. Pop., in 1822, 593,895. Its surface is a dead flat, intersected by arms of the Ganges, and comprising many extensive fields or marshes, with a considerable portion of the jungle tract known as the Sunderbunds. It has long been progressively increasing in productiveness and importance; but, like the adjacent district of Bacher-gury, has been notorious for the prevalence of dacoity or gang-robbery. The Hindus are reckoned in proportion to the Mohammedans as 3 to 1. Total land-revenue, 1829-30, 1,139,888 rupees.

TWICKENHAM, a village and par. of England, co. Middlesex, hund. Isleworth, on the Thames, 10 m. W. by S. London, and 2 m. S.W. Richmond. Area of par., 2,440 acres. Pop. of do. in 1831, 4,871. The village consists of a street nearly parallel to the river, and of a number of detached villas. It would hardly, however, have been worth notice in a work of this kind, but for its having possessed the villa, famous as the favourite residence of the most elegant, harmonious, and correct of English poets, where he composed many of his noblest works, and where he expired on the 30th of May, 1744.

But to the disgrace as well of the country as of the parties more immediately concerned, "Pope's Villa" has been levelled with the ground! The structure now lives only in his immortal verses; and even his grotto,

"Where, nobly, pensive, St. John sat and thought;  
Where British sighs from dying Wyndham stole,  
And the bright flame was shot through Marchmont's soul;"

has been suffered to go to ruin!

The church, a brick building, erected in 1714, contains the remains of the poet and of his parents. Pope himself raised a monument to the memory of the latter; and a monument to himself was raised some years after his death, by his friend and literary legatee, Bishop Warburton. It is of grey marble, in the pyramidal form, and has a bust or medallion of the poet.

Among the existing villas in the vicinity of Twickenham, the most celebrated is that of Strawberry-hill, long the residence of Mr. Horace Walpole, by whom it was built, in a sort of trumphy Gothic style, and filled with a singular collection of rare, though mostly trifling articles. In the course of this year (1842), however, the collection has been sold by auction; and the villa itself, which is a very paltry affair, will probably soon share the fate of that of Pope. A national school, for the education of children of both sexes, was established in the village in 1809.

TYNE, an important river in the N. of England, is formed by the junction of two very considerable streams, the N. and S. Tyne. The latter rises on the borders of Durham and Cumberland, near Cross-Fell, one of the highest mountains in the great central range; and the former in the moorlands of Northumberland close to the Scottish border. They unite a short way from Hexham. After their junction, the river takes an easterly direction; and dividing Northumberland from Durham, and passing Newcastle, falls into the sea at Tynemouth, having the towns of N. and S. Shields close to its embouchure.

The Tyne is navigable for ships of from 300 to 400 tons burden, as far as Newcastle, and is navigated a few miles farther by keels, a peculiar description of craft employed to carry coal to the coal-ships. The banks of the Tyne at Newcastle are steep, and the ground rises on each side to a considerable height. Down to a comparatively late period the salmon fisheries in this river were of considerable value and importance. In 1761, no fewer than 260 fish were caught at one draught at Newburn; and in 1775, 275 were landed at one draught at the Low Lights, near the mouth of the river. The fisheries have, however, for several years past, been all but annihilated; a circumstance which has been variously accounted for, but which, perhaps, is most properly to be ascribed to the locks constructed at Bywell to improve the navigation of the river, preventing the ascent of the fish in the breeding season to the shallow streams in the upper parts of the river. For an account of the trade and shipping of this river the reader is referred to the articles NEWCASTLE, SOUTH SHIELDS, and TYNEMOUTH, in this work.

TYNEMOUTH and NORTH SHIELDS, a par. bor., co. Northumberland, on the N. bank of the Tyne, at its mouth in the German Ocean, immediately opposite South Shields, and 7 m. E.N.E. Newcastle. The par. bor., consisting of the townships of Tynemouth, N. Shields, Chilton, Preston, and Cullercoats, had in 1831, a pop. of 25,201, and in 1841, of 25,808. The township of Tynemouth occupies its most E. angle, and at its S.W. extremity is the town of N. Shields. The township of Chilton stretches along the whole S.W. side of the par. adjoining N. Shields. Preston adjoins both that town and the township of Tynemouth; it is of small extent, but contains some excellent houses, and a large pop. for its small area, as compared with some of the other townships. At the N. extremity of the township of Tynemouth is that of Cullercoats, which contains the fishing town of that name. This township comprises only about 5 or 6 acres of land, the greater part of which is covered with buildings. (*Bound. Rep.*) The village of Tynemouth has been much enlarged of late years; it is in general well built, and during the summer season is much resorted to for bathing. Its most remarkable edifice is the castle, originally a priory erected in the 11th century upon a previous foundation; it stands on a lofty and rocky peninsula, and is approached by the W. by a gateway flanked by towers, the whole being inclosed by a wall which runs for the most part along the edge of the cliff, at the N.E. angle of which is a light-house. Great care is taken by government to preserve the remains of the edifice, which forms a sea-mark for ships approaching the harbour or navigating the coast. The ruins of the priory within consist of a turret, now serving as a barrack, other buildings converted into military magazines, &c. Mr. Rickman says, that these exhibit very fine specimens of monastic remains, and the parts now existing, which belonged to the E. end, and some other portions of the church, are of remarkably beautiful design. The style is early English, with considerable

enrichment, and though the stone is much decayed, it shows great delicacy of execution. (*Goth. Archit.*) A monument is about to be here erected in honour of Lord Collingwood. This church was parochial till 1657, when a new church was built near N. Shields. The living of Tynemouth, a vicarage, worth 298*l.* a year, is in the gift of the Duke of Northumberland. Two other churches have recently been erected: one at the W. end of the par., and the other at the village of Tynemouth, which are curacies in the appointment of the vicar.

North Shields has increased rapidly of late years in size and importance, along with the increasing trade of the Tyne. It has many good streets and squares, a good market-place, gas and water works, a public library, scientific institution, neat theatre, Lancastrian and other schools, a sailors' relief society, meeting-houses for most of the principal dissenting sects, and a weekly newspaper. The Master Mariners' Asylum, the site for which was granted by his grace the Duke of Northumberland, is a neat stone edifice, recently built on the road leading from North Shields to Tynemouth. "The condition of the town of North Shields is certainly prosperous; it is progressively increasing in importance. The manufactures in this town are merely of those articles which are required by the ship-builder. Much building is in progress; and many improvements have been both commenced and agreed upon. New roads are to be made through the par. towards the W. and N.W.; and a railroad, 64 m. in length, now (1842) connects this town with Newcastle, passing through the township of Chirton. The town is chiefly extending itself on the W. and N.W. into Chirton and Preston townships, and in the direction of the town of Tynemouth. There is no doubt that in a few years the village of Chirton will be nearly united to North Shields by a continuous street, and that a great portion of the township of Preston will be occupied by that town. Already several buildings of a superior class have been erected in that township in its immediate neighbourhood; and the whole of a small part of that of Tynemouth, adjoining both Preston and Chirton is either covered with new buildings, or marked out as for their future site. It is stated that the town had taken the direction of Tynemouth and Preston, rather than Chirton, in consequence of the land of the latter township adjoining that town being in settlement." (*Bound. Rep.*) There is a bar at the river's mouth, but at high water it may be crossed by vessels of 500 tons, and those of 300 tons lie close to the quays. Ships, as explained in the article on SOUTH SHIELDS (which see), lie in tiers in the river, and were formerly loaded with the coal brought down the river in lighters; but of late years, stables and drops having been erected, the intervention of lighters is in a great measure superseded. This town, as well as that of S. Shields, is included in the port of Newcastle; but, in 1840, there belonged to it especially, 337 ships; and during the same year 9 vessels were built in the port, of the burden of 808 tons. The entrance to the Tyne is defended by Clifford's Fort, on its N.E. bank, near which is the low lighthouse; the high lighthouse being on the hill opposite Dockward Square. Its dependence on Newcastle is much complained of, as it obliges all ships to clear out from the latter. The shipping of coal is the staple business of the port.

The town is under the jurisdiction of the co. magistrates, but has a court for the recovery of debts under 40*l.*, held at Easter and Michaelmas, by the steward of Tynemouth Manor. It is lighted and watched by commissioners under a local act. The erection of a bridge over the river was formerly contemplated; but that project has been abandoned, and the communication between the towns of North and South Shields is maintained by means of a steam ferry. The Reform Act conferred on the bor. of Tynemouth the privilege of returning 1 m. to the H. of C. Registered electors, in 1839-40, 764.

TYRE (*Tyre*), the principal city of Phœnicia, and the most celebrated emporium of the ancient world, on the S.E. coast of the Mediterranean, where the inconsiderable town of Toudr, with 1,500 inhab., now stands, lat. 35° 17' N., long. 35° 14' 36" E. The harbour of the modern town is closed up, and we have introduced this article merely that we might have the opportunity of laying before the reader some statements respecting the commerce, arts, and navigation of the Tyrians, the most distinguished mercantile people of antiquity.

Tyre was founded by a colony from Sidon, the most ancient of the Phœnician cities. The date of this event is not certainly known, but Larcher supposes it to have been 1,600 years before the Christian era. (*Chronologie d'Hérodote*, cap. ii. p. 131.) It is singular that while Homer mentions Sidon, he takes no notice of Tyre, whose glory speedily eclipsed that of the mother city; but this is no conclusive proof that the latter was not then a considerable emporium. The prophets Isaiah, Jeremiah, and Ezekiel, who flourished from 700 to 600 years before Christ, represent Tyre as a city of unrivalled wealth, whose "merchants were princes, and her traffickers the honourable of the earth." Originally, the

city was built on the main land; but having been besieged for a lengthened period by the Babylonian monarch Nebuchadnezzar, the inhabitants conveyed themselves and their goods to an island at a little distance, where a new city was founded, which enjoyed an increased degree of celebrity and commercial prosperity. The old city was, on that account, entitled Palatyre, and the other simply Tyre. The new city continued to flourish, extending its colonies and its commerce on all sides, till it was attacked by Alexander the Great. The resistance made by the Tyrians to that conqueror showed that they had not been enervated by luxury, and that their martial virtues were nowise inferior to their commercial skill and enterprise. The overthrow of the Persian empire was a less difficult task than the capture of this single city, which was not effected till a mound had been carried from the main land to the island on which it was built. The victor had not magnanimity to treat the vanquished as their heroic conduct deserved. In despite, however, of the cruelties inflicted on the city, she rose again to considerable eminence. But the foundation of Alexandria, by diverting the commerce that had formerly centered at Tyre into a new channel, gave her an irreparable blow; and she gradually declined till, consistently with the denunciation of the prophet, her palaces have been levelled with the dust, and she has become "a place for the spreading of nets in the midst of the sea."

*Commerce, Colonies, &c. of Tyre.*—Phœnicia was one of the smallest countries of antiquity. It occupied that part of the Syrian coast which stretches from Aradus (the modern Roud) on the N., to a little below Tyre on the S., a distance of about 60 leagues. Its breadth was much less considerable, being for the most part bounded by Mount Libanus to the E., and Mount Carmel on the S. The surface of this narrow tract was generally rugged and mountainous; and the soil of the valleys, though moderately fertile, did not afford sufficient supplies of food to feed the pop. Libanus and its dependent ridges were, however, covered with timber suitable for ship building; and besides Tyre and Sidon, Phœnicia possessed the ports of Tripoli, Beblus, Berytus, &c. In this situation, occupying a country able to supply them with sufficient quantities of corn, hemmed in by mountains, and by powerful and warlike neighbours, on the one hand, and having, on the other, the wide expanse of the Mediterranean, studded with islands, and surrounded by fertile countries, to invite the enterprise of her citizens, they were naturally led to engage in maritime and commercial adventures; and became the boldest and most experienced mariners, and the greatest discoverers, of ancient times.

From the remotest antiquity, a considerable trade seems to have been carried on between the eastern and western worlds. The spices, drugs, precious stones, and other valuable products of Arabia and India have always been highly esteemed in Europe, and have exchanged for the gold and silver, the tin, wines, &c. of the latter. At the first dawn of authentic history, we find Phœnicia the principal centre of this commerce. Her inhabs. are designated in the early sacred writings by the name of Canaanites,—a term which, in the language of the East, means merchants. The products of Arabia, India, Persia, &c. were originally conveyed to her by companies of travelling merchants, or caravans; and which seem to have been constituted in the same way, and to have performed exactly the same part in the commerce of the East, in the days of Jacob, that they do at present. (*Gen.* xxvii. 25, &c.) At a later period, however, in the reigns of David and Solomon, the Phœnicians, having formed an alliance with the Hebrews, acquired the ports of Elath and Eziongaber, at the N.E. extremity of the Red Sea. Here they fitted out fleets, which traded with the ports on that sea, and probably with those of Southern Arabia, the W. coast of India, and Ethiopia. The ships are said to have visited Ophir; and a great deal of attention has been expended in attempting to determine the exact situation of that emporium or country. We agree, however, with Heeren in thinking that it was not the name of any particular place; but that it was a sort of general designation given to the coasts of Arabia, India, and Africa, bordering on the Indian Ocean; somewhat in the same loose way as we now use the terms East and West Indies. (See the chapter on the *Navigation and Commerce of the Phœnicians*, in the translation of Heeren's work.)

The distance of the Red Sea from Tyre being very considerable, the conveyance of goods from the one to the other by land must have been tedious and expensive. To lessen this inconvenience, the Tyrians, shortly after they got possession of Elath and Eziongaber, nearest to Rhinoculura, the port in the Mediterranean nearest to the Red Sea. The products of Arabia, India, &c., being carried thither by the most expeditious route, were then put on board ships, and conveyed by a brief and easy voyage to Tyre. If we except the transit by Egypt, this was the shortest and most direct, and for that reason, no

doubt, the cheapest, channel by which the commerce between Southern Asia and Europe could then be conducted. But it is not believed that the Phœnicians possessed any permanent footing on the Red Sea after the death of Solomon. The want of it does not, however, seem to have sensibly affected their trade; and Tyre continued, till the foundation of Alexandria, to be the grand emporium for eastern products, with which it was supplied by caravans from Arabia, the bottom of the Persian Gulf, and from Babylon, by way of Palmyra.

The commerce of the Phœnicians with the countries bordering on the Mediterranean was still more extensive and valuable. At an early period they established settlements in Cyprus and Rhodes. The former was a very valuable acquisition, from its proximity, the number of its ports, its fertility, and the variety of its vegetable and mineral productions. Having passed successively into Greece, Italy, and Sardinia, they proceeded to explore the southern shores of France and Spain, and the northern shores of Africa. They afterwards advanced upon the Atlantic, and were the first people whose flag was displayed beyond the Pillars of Hercules.\*

Of the colonies of Tyre, Gades, now Cadiz, was one of the most ancient and important. It is supposed by M. de St. Croix to have originally been distinguished by the name of Tartessus or Tarshish, mentioned in the sacred writings. (*De l'Etat et du Sort des Anciennes Colonies*, p. 14.) Heeren, on the other hand, contends, as in the case of Ophir, that by Tarshish is to be understood the whole southern part of Spain, which was early occupied and settled by Phœnician colonists. (See also *Iliad*, *Commerce des Anciens*, cap. 8.) At all events, however, it is certain that Cadiz early became the centre of a commerce that extended all along the coasts of Europe as far as Britain, and perhaps the Baltic. There can be no doubt that by the Cassiterides, or Tin Islands, visited by the Phœnicians, is to be understood the Scilly Islands and Cornwall. The navigation of the Phœnicians, probably, also, extended a considerable way along the western coast of Africa; of this, however, no details have reached us.

But of all the colonies founded by Tyre, Carthage has been by far the most celebrated. It was at first only a simple factory; but was materially increased by the arrival of a large body of colonists, forced by dissensions at home to leave their native land, about 883 years B.C. (*St. Croix*, p. 20.) Imbued with the enterprising mercantile spirit of their ancestors, the Carthaginians rose in no very long period to the highest eminence as a naval and commercial state. The settlements founded by the Phœnicians in Africa, Spain, Sicily, &c., gradually fell into their hands; and after the destruction of Tyre by Alexander, Carthage engrossed a large share of the commerce of which it had previously been the centre. The history, commerce, and institutions of Carthage, and the misfortunes by which she was overwhelmed, have, however, been already noticed in this work (See *CARTHAGE*); and we shall only, therefore, observe, that commerce, instead of being, as some shallow theorists have imagined, the cause of her decline, was the real source of her power and greatness; the means by which she was enabled to wage a lengthened, doubtful, and desperate contest with Rome herself for the empire of the world.

The commerce and navigation of Tyre probably attained their maximum from 650 to 550 years B.C. At that period the Tyrians were the factors and merchants of the civilised world; and they enjoyed an undisputed pre-eminence in maritime affairs. The prophet Ezekiel (chap. xxvii.) has described in magnificent terms the glory of Tyre; and has enumerated several of the most valuable productions found in her markets, and the countries whence they were brought. The fir trees of Senir (Hermion), the cedars of Lebanon, the oaks of Bashan (the country to the E. of Galilee), the ivory of the Indies, the fine linen of Egypt, and the purple and hyacinth of the Isles of Elishah (Peloponnesus), are specified among the articles used for her ships. The inhabitants of Sidon, Arvad (Aradus), Gebel (Byblos), served her as mariners and carpenters. Gold, silver, lead, tin, iron, and vessels of brass; slaves, horses, mules, sheep, and goats; pearls, precious stones, and coral; wheat, balm, honey, oil, spices, and gums; wine, wool, and silk; are mentioned as being brought into the port of Tyre by sea, or to its markets by land, from Syria, Arabia, Damascus, Greece, Tarshish, and other places, the exact site of which it is difficult to determine.

Such, according to the inspired writer, was Tyre, the "Queen of the waters," before she was besieged by Nebuchadnezzar. But, as has been already remarked, the result of that siege did not affect her trade, which was as

\* Mons Calpe and Mons Aplyia, the Gibraltar and Cruta of modern times.

† There is, in Dr. Vincent's *Commerce and Navigation of the Ancients in the Indian Ocean* (vol. ii. pp. 624–626), an elaborate and (like the other parts of that work) judicious commentary on this chapter of Ezekiel, in which most of the names of the things and places mentioned are satisfactorily explained. (See also Heeren on the Phœnicians, cap. i.)

successfully and advantageously carried on from the new city as from the old. Inasmuch, however, as Carthage soon after began to rival her as a maritime and mercantile state, this may, perhaps, be considered as the era of her greatest celebrity.

It would not be easy to over-rate the beneficial influence of that extensive commerce from which the Phœnicians derived such immense wealth. It inspired the people with whom they traded with new wants and desires, at the same time that it gave them the means of gratifying them. It every where gave fresh life to industry, and a new and powerful stimulus to invention. The rude uncivilised inhabs. of Greece, Spain, and Northern Africa, acquired some knowledge of the arts and sciences practised by the Phœnicians; and the advantages of which they were found to be productive secured their gradual though slow advancement.

Nor were the Phœnicians celebrated only for their wealth, and the extent of their commerce and navigation. Their fame, and their right to be classed amongst those who have conferred the greatest benefits on mankind, rest on a still more unassailable foundation. Antiquity is unanimous in ascribing to them the invention and practice of all those arts, sciences, and contrivances that facilitate the prosecution of commercial undertakings. They are held to be the inventors of arithmetic, weights and measures, of money, of the art of keeping accounts, and, in short, of every thing that belongs to the business of a counting-house. They were, also, famous for the invention of ship-building and navigation; for the discovery of glass; for their manufactures of fine linen and tapestry; for their skill in architecture, and in the art of working metals and ivory; and still more for the incomparable splendour and beauty of their purple dye. (See the learned and invaluable work of the President de Goguet, *Sur l'Origine des Loix*, &c., Eng. trans. vol. i. p. 296., and vol. ii. pp. 98–100; see also the chapter of Heeren on the *Manufactures and Land Commerce of the Phœnicians*.)

But the invention and dissemination of these highly useful arts form but a part of what the people of Europe owe to the Phœnicians. It is not possible to say in what degree the religion of the Greeks was borrowed from theirs; but that it was to a pretty large extent seems abundantly certain. Hercules, under the name of Melcarthus, was the tutelary deity of Tyre; and his expeditions along the shores of the Mediterranean, and to the straits connecting it with the ocean, seem to be merely a poetical representation of the progress of the Phœnician navigators, who introduced arts and civilisation, and established the worship of Hercules, wherever they went. The temple erected in honour of the god at Gades was long regarded with peculiar veneration.

The Greeks were, however, indebted to the Phœnicians, not merely for the rudiments of civilisation, but for the great instrument of its future progress—the gift of letters! No fact in ancient history is better established than that a knowledge of alphabetic writing was first carried to Greece by Phœnician adventurers; and it may be safely affirmed, that this was the greatest boon any people ever received at the hands of another.

Before quitting this subject, we may briefly advert to the statement of Herodotus with respect to the circumnavigation of Africa by Phœnician sailors. The venerable father of history mentions, that a fleet fitted out by Necho, King of Egypt, but manned and commanded by Phœnicians, took its departure from a port on the Red Sea, at a epoch which is believed to correspond with the year 604 before the Christian era, and that, keeping always to the right, they doubled the southern promontory of Africa; and returned, after a voyage of 3 years, to Egypt, by the Pillars of Hercules. (*Herod.* lib. iv. § 42.) Herodotus further mentions, that they related that, in sailing round Africa, they had the sun on their right hand, or to the north—a circumstance which he frankly acknowledges seemed incredible to him, but which, as every one is now aware, must have been the case if the voyage were actually performed.

Many learned and able writers, and particularly Gosselin (*Recherches sur la Géographie Systématique et Historique des Anciens*, tome i. pp. 204–217.), have treated this account as fabulous. But the objections of Gosselin have been successfully answered in an elaborate note by Larcher (*Herodote*, tome iii. pp. 458–464, ed. 1802); and Major Rennell has sufficiently demonstrated the practicability of the voyage. (*Geography of Herodotus*, p. 682, &c.) Without entering upon this discussion, we may observe, that not one of those who question the authenticity of the account given by Herodotus presume to doubt that the Phœnicians braved the boisterous seas on the coasts of Spain, Gaul, and Britain; and that they had, partially at least, explored the Indian Ocean. But the ships and seamen that did this much, might, undoubtedly, under favourable circumstances, double the Cape of Good Hope. The relation of Herodotus has, besides, such an appearance of good faith, and the circumstance which he doubts, of the navigators having the sun on the right,

affords so strong a confirmation of its truth, that there really seems no reasonable ground for doubting that the Phenicians preceded, by 2,000 years, Vasco de Gama in his perilous enterprise. (We have borrowed this article from the *Commercial Dict.*)

**TYROL** and **VORARBERG** (an. *Rhetia*, with part of *Noricum*), a prov. of the Austrian empire, principally between the 46th and 48th degrees of N. lat., and the 10th and 13th of E. long.; having E. the archd. of Austria (Salzburg, &c.), and Carinthia; S., the Lombardo-Venetian kingdom; W., Switzerland (the Grisons, &c.) and the princip. of Liechtenstein; and N., Bavaria. Length, E. to W., about 120 m.; average breadth somewhat less than 100 m. Area estimated at about 11,000 sq. m. Pop., in 1838, 831,298. This country may be regarded as an extension of Switzerland towards the E. It is traversed in its whole extent by the main ridge of the Alps, which has here some of its loftiest summits, including, among others, Mount Orteler 12,825 ft., and the Gross Gluckner 12,567 ft. above the level of the sea. This grand chain separates the waters that flow N. to the Rhine and the Upper Danube from those that flow S. to the Po and the Adriatic, and the Lower Danube. But, exclusive of this gigantic chain, an inferior chain from 50 to 60 m. S. of the latter divides the country into three portions: the Valley of the Inn, to the N. of the High Alps; that of the Drave, between the High Alps and the inferior chain; and the country to the S. of the latter drained by the Adige, Piave, and other rivers flowing into the Adriatic. The Vorarlberg, N.W. from the Tyrol, forms part of the basin of the Rhine, being drained by the Ill and Bregen, and bounded on the N.W. by the Lake of Constance. There are many small lakes in the country, but none is of any consequence; the Achensee, in the S., is the principal. The climate is very various. To the N. of the High Alps, and in the intermediate district, or valley of the Drave, it is very severe. Some very extensive mountain tracts are covered with immense glaciers and the accumulated snows of ages. The medium temperature of the year at Innsbruck is about 50°; at Botzen, or Bolzano, 57° Fahr. But the narrow valleys in the S., which unite with the plain of Lombardy, are very hot in summer; and frequently, indeed, experience the sirocco. In general, the spring and summer are wet, and autumn is the most agreeable season.

The central chain of the Alps is composed chiefly of granite, flanked on either side with a zone of slate, overlapped by limestone: the accompanying ranges on both the N. and S. sides are mostly calcareous. Estimating the total extent of land in the prov. at about 7,000,000 acres, it has been distributed in *Becker's Handb'ds Lexicon*, Vienna, 1836, as follows: viz., cultivated or arable land, 536,520 acres; vineyards, 74,636 do.; meadows and gardens, 615,520 do.; commons, 922,593 do.; and forests, 2,767,496 do., making, in all, 6,862,573 ac.; leaving, consequently, above 2,000,000 acres of land occupied by inaccessible mountains, glaciers, and snow-tracts. The products and husbandry in the S. are much the same as in the N. parts of Lombardy. In other parts of the Tyrol, maize, wheat, and pulse are grown in the bottoms, and scanty crops of buckwheat, rye, and oats on the mountain sides; but the produce of corn is insufficient for the consumption. The Tyrol is in fact, like the greater part of Switzerland, a pastoral country: the chief wealth of its inhabs. consisting in their cattle and other live stock. The cattle are kept in the valleys throughout the winter, but are in spring driven to the uplands, proceeding higher and higher as the lower meadows become exhausted and the upper divested of snow; and returning again in September. The meadows yielding the thickest grass are set aside for a hay crop. The hay, when cut, is carefully dried under cover, and stored up in sheds; but it is quite insufficient for the winter supply of the cattle, many of which have to be fed on maize stalks, ash leaves, &c. In the circle of Roveredo, and other parts of the count. adjoining Italy, a good many silk-worms are reared; and the annual average produce of silk is estimated at 3,200 centners. The rearing of canary-birds, though apparently an insignificant branch of industry, is pretty extensively carried on at Imst, and other places in the valley of the Inn; and, in fact, the Tyrol supplies most parts of Europe with these songsters. Among the wild animals are wolves, wild boars, and bears: the clefts of the rocks afford shelter to the marmots; and the chamois finds refuge on the highest summits, or in places secure from the approach of the hunter.

The precious metals and copper are met with; but they are of little importance. Iron and salt are abundant in certain districts; and though mining industry be in a rather backward state are produced in considerable quantities. Silk is manufactured in the S.; next to which, iron wire, plates, nails, and other kinds of hardware are the principal products. Leather, linen fabrics, wooden articles (some of which are executed with great skill, and display much ingenuity), glass, paper, toys,

and (at Innsbruck, Imst, &c.) some cotton goods, are produced. But the principal exports are cattle, cheese, silk, iron, salt, wine, timber, tobacco, and other raw produce, in return for corn and most sorts of manufactured goods. The inhabs. are exceedingly industrious, ingenious, and inventive; but the poverty of the country obliges them, notwithstanding, to migrate in great numbers; and several thousands annually leave their homes for Swabia, Bavaria, Italy, and more distant countries, where they exercise various functions, and continue for a longer or shorter time till, by dint of economy, they have saved what they suppose will maintain them at home, when they immediately return. A considerable transit trade is carried on across the Tyrolean Alps, between Italy and the S. parts of Germany. The principal route for this is by the road over the Brenner pass, between Innsbruck and Brixen; and thence to Bolzano and Roveredo. At its highest point this road attains to an elevation of 4,634 ft. At the W. extremity of the Tyrol is the famous military road over Monte Stelvio, rising to the prodigious height of 8,960 ft. above the sea, being the highest elevation of any carriage road in Europe.

In the official registers of the Austrian empire, Tyrol bears only the appellation of county; but it has its own diet composed of four orders of members—the clergy, nobility, the deputies of the towns, and those of the peasantry, all of whom assemble in one chamber. No new tax can be imposed without the consent of this body; and when it is granted, the sovereign is bound to make an explicit acknowledgment that the states might have refused it had they chosen. In addition to the states, there exists a permanent deputation and tribunal, in which the peasantry are represented. The only imposts are a land tax, payable indiscriminately by all classes, and a charge on the higher classes, consisting of a per centage on pensions, tithes, and rents.

The Tyrol is divided into seven circles, their chief towns being Botzen, Schwatz, Imst, Bruneck, Tient, Roveredo, and Bregen; in each of which is a court of justice. Innsbruck is the general cap. and the seat of the highest judicial tribunal. The pop. is almost wholly R. Catholic, under the superintendence of ten bishops subordinate to the archbishop of Salzburg.

The character of the Tyrolean is said to contrast favourably with that of the Swiss. In the N. or German portion of the country they are neither so fawning nor mercenary as the latter; and in the S. they approach the Italian standard in their manners and disposition as well as their language. Though quite as attached to personal and national liberty as the Swiss, the Tyrolean have always been steadfast adherents of Austria; and, next to the archduchy, the Tyrol may be depended upon as the prov. most likely to remain firmly attached to the House of Hapsburg in the event of any future dismemberment of the empire. But the Austrians draw little or no disposable military force from the Tyrol. Its inhabs. form an irregular militia, and act with the greatest vigour and alacrity in the defence of their country; but their natural repugnance to a disciplined military life is so great, that all attempts to extend the conscription to this prov. have hitherto proved unsuccessful. Of late, indeed, a part of the regiment of *Jägers*, raised in the Tyrol for its own defence, has been removed into another prov.; but this measure appears to have produced much dissatisfaction.

The dress of the peasantry is peculiar. The principal finery of the men consists of a straw hat ornamented with ribbands and nosegays: the dress of the women consists of a thick and short gown, stockings with cross stripes, and a cap tapering in the shape of a sugar-loaf. Music and dancing, rifle-shooting and athletic exercises, are the favourite amusements of the Tyrolean; in all which they excel.

From the fall of the Roman empire, this region ceased to be permanently united under one head till 1283; not long after which period, it passed by inheritance to the dukes of Austria, to whose descendants it has ever since belonged, with the exception of the period from 1806 to 1814. From 1806 to 1809, it belonged to Bavaria. The government of the Bavarians was, however, very disturbed; and the Tyrolean under Hofer maintained a doubtful contest with them and the French till 1810; when Hofer, having been taken and shot at Mantua, the Tyrol was governed by the French till 1814, when it reverted to Austria. (*Austrian Nat. Encyc.; Berghaus; Malte-Brun, &c.*)

**TYRONE**, an inland co. of Ireland, prov. Ulster having N. Londonderry, E. Lough Neagh and Armagh, S. Monaghan and Fermanagh, and W. Donegal. It contains 754,395 acres, of which 171,314 are unimproved mountain and bog, and 57,961 water, being a fraction of Lough Neagh. Surface in many places, especially on the N. and W., rough and mountainous; but there is, notwithstanding, a large extent of fertile land. Property mostly in very large estates. Farms of various sizes; those in the mountainous districts large, and seldom

much subdivided. Tillage farms small, and generally held under partnership leases; and it is almost needless to add that wherever this is the case agriculture is execrable. A great deal of work is done by the spade; and where ploughs are used, they are sometimes drawn by horses, bullocks, and milk cows, all yoked together! Potatoes and oats, the principal crops. Cattle and sheep very inferior. "Tenants may do what they will in regard to the management of their farms, if they only pay the rent." (*Poor Inquiry*, Append. F., p. 323.) Average rent of land, 14s. 6d. an acre. Habitations of the bulk of the people extremely mean: they live principally on oatmeal and potatoes, rarely tasting butchers' meat. Linen manufacture pretty generally diffused. A coal mine is wrought between Dungannon and Stewarston, but the coal is inferior. There is a good pottery near Dungannon. This is one of the counties in which illicit distillation was most prevalent. Principal rivers, Blackwater, Foyle, Ballinderry, with several others of inferior importance.

Tyrone contains 4 baronies, and 35 parishes; and returns 3 mems. to the H. of C., being 2 for the co., and 1 for the bor. of Dungannon. Registered electors for the co. in 1839-40, 3,594. In 1831 Tyrone had 84,663 inhab. houses, 67,035 families, and 304,468 inhabs., of whom 149,410 were males, and 155,058 females.

TYSDRUS or TYSDRA, an ancient and considerable, but now ruined, city of N. Africa, Reg. of Tunis, at present represented by the inconsiderable village of El Jemme, 110 m. S. by E. Tunis, and 30 m. W. by S. the port of Mehadiah, or Africa. The walls of the ancient town may still be distinctly traced, and it comprises, besides the foundations of temples and other buildings, the mutilated fragments of columns, statues, &c. But the distinguishing feature of the place, and that which gives it all its present interest, is its superb amphitheatre. This noble ruin, the exterior of which is in a high state of preservation, is of vast size and magnificence, being 429 ft. in length, by 368 ft. in breadth, and 96 ft. in height, so that it is inferior only, in respect of magnitude, to the Colosseum and the amphitheatre of Verona. It consisted originally of 64 arches, and 4 rows of columns of the Composite order, placed above each other. At each extremity was a grand entrance; but one of these, with an arch on either side, was destroyed, about a century ago, by one of the beys of Tunis, to prevent the ruin being occupied as a fortress by his rebellious subjects. The arena is nearly circular. There are no inscriptions by which we may learn the date or founders of this magnificent structure; but Dr. Shaw supposes, from its similarity to other structures of the same period, that it is of the age of the Antonines; and as the elder Gordian was proclaimed emperor in Tydrus, he concludes that he may, probably out of gratitude to the citizens, have presented them with this grand structure for the celebration of those barbarous sports then so much in fashion. (*Travels*, p. 117, 4to. ed.; see also *Temple's Excursions in Algiers and Tunis*, l. 150.)

## U.

UDINE, a town of Austrian Italy, cap. deleg. Udine or Friuli, on the Roja, 60 m. N.E. Venice. Pop., in 1837, 19,783. (*Berghaus*.) It is fortified and well built, but from its situation in a wide and level plain, its external appearance has nothing striking. Its streets are lined with arcades; and in the great square is a fine monument in commemoration of the treaty of Campo Formio (which village is in the immediate neighbourhood). Principal buildings, the cathedral, with some handsome marble columns and bas-reliefs, two par. churches, the chief guard-house, surmounted by a tower and two iron figures to strike the hours, the town-hall, bishop's palace, a good opera-house, &c. The old castle, on elevated ground in the middle of the town, is now a prison. The French, during their occupation, constructed several public walks and otherwise embellished the town. Udine is the seat of the provincial assembly and superior courts, and has a lyceum, 2 gymnasia, a high school, episcopal seminary and library, a society of agriculture, several hospitals, asylums, &c. The inhabs. are principally engaged in the silk trade, but they also manufacture linen fabrics, leather, paper, and liquors. (*Aust. Nat. Encyc.*, &c.)

UIST, NORTH AND SOUTH. See HEBRIDES.

ULEABORG, a town and seaport of Finland, cap. lan, or district of its own name, on a peninsula at the mouth of the Ulea in the Gulph of Bothnia, 68 m. S.E. Tornea. Pop. about 5,000. It is regularly built, and is, after Abo, the principal commercial town of the prov. Its harbour is, unfortunately, in great part choked up with sand. The chief exports are pitch, tar, fish, and salted butter. It was founded in 1605, and has frequently suffered from fire, by which it was nearly de-

stroyed on May 25., 1822. (*Schottelzer, La Russie; Paris*.)

ULM, a frontier town of Wirtemberg, cap. circ. Danube, on the Danube where it begins to be navigable, 45 m. S.E. Stuttgart, and 44 m. W. by N. Augsburg. Pop. about 14,600. It has an antiquated appearance, and, though it has some traffic, a garrison, &c., it is dull. The cathedral, a fine Gothic building, has an unfinished tower, 337 German ft. in height. The body of the building is 416 ft. in length, 166 ft. in breadth, the nave being 152 ft. in height (*Stein*), so that it is larger than any other church in Germany. This edifice was erected, between 1377 and 1494, at the sole expense of the citizens of Ulm. It has some beautiful stained glass and carved work, and a tablet commemorating a showman's feat of the Emperor Maximilian, in 1492, who is said to have stood on the parapet of the tower, on one foot, balancing a coach-wheel with the other! Several other buildings are worthy of notice, as the town-hall, government and custom houses, corn-hall, and arsenal. Ulm has a gymnasium, a large and richly-endowed hospital, a female orphan asylum, and the house of correction for the circle. Tobacco pipe-bowls, linen fabrics, leather, paper, vinegar, &c., are made by the inhabs. many of whom also engage in horticulture, boat-building, the transit of goods, and the rearing of snails for export to Bavaria and Austria. Large quantities of Rhenish, Swiss, and other wines, are brought thither to be shipped down the Danube. Ulm was formerly strongly fortified, and a military post of importance. (*Berghaus; Memminger's Wirtemberg; Spencer's Germany*.)

In 1805, Ulm was the theatre of some most important military events. Austria, having declared war against France, pushed forward a strong army into Bavaria, under General Mack, who established his head quarters at Ulm. But Napoleon having succeeded by a series of masterly manoeuvres in cutting off Mack's communications with Austria, the latter was cooped up in the city with all that portion of his army, amounting to about 26,000 men, that had not already fallen into the hands of the French. Considering the strength of the place, and the numbers of the garrison, a vigorous resistance might have been anticipated; but, instead of this, Mack capitulated on the 17th of October, and delivered up the town, and his army as prisoners of war, without so much as firing a shot!

ULSTER, one of the provinces into which Ireland is divided, and the most northerly, comprising the cos. of Donegal, Londonderry, Antrim, Tyrone, Fermanagh, Monaghan, Armagh, Down, and Cavan.

ULVERSTONE, a market-town and par. of England, hund. Furness, co. Lancaster, about 2 m. from the W. side of the embouchure of the Leven in Morecambe bay, on a tract apparently abandoned by the sea, 14 m. N.W. Lancaster. Area of par., 29,100 acres. Pop., in 1831, 7,741. Of late years the town has greatly improved: it has now a neat theatre, two subscription libraries, news and assembly-rooms, &c.; and, besides the par. church, Trinity Church has been erected within these few years. The livings of both are perpetual curacies, in the gift of — Braddell, Esq.; that of the par. is worth 149*l.*, and that of Trinity Church 143*l.* a year. The par. church is a handsome modern structure, in the style that prevailed in the time of Henry VIII., with a good altar-piece of the Descent from the Cross, and an E. window of stained glass. There are also meeting-houses for Dissenters, and some public schools of a minor kind. In 1795 a canal was cut from the river Leven, by which vessels of 400 tons reach a large basin, and load or unload close to the town. The inhabs. principally manufacture cotton goods, canvass hats, &c., and are occupied in conveying coastwise copper and iron ore, limestone, corn, and slates; the latter being exported in large quantities. Ulverstone belongs to the port of Lancaster. It is the seat of petty sessions for the hundred, manorial courts for the recovery of debts under 40*l.*, &c.

UNITED STATES (THE), a federal republic, and the leading state of N. America, and indeed of the American continent, ranking immediately after the great powers of Europe. The U. States claim the sovereignty over a vast portion of the N. American continent, stretching from the Atlantic on the E. to the Pacific on the W. between the British territories on the N. and those of Mexico and Texas on the S., and included within the 25th and 49th degs. of N. lat., and the 66th and 124th of W. lon. But the States themselves extend only between the 29th and 47th degs. of lat., and the 67th and 99th of lon., having, N., Canada, from which they are mostly divided by the St. Lawrence and the great lakes; W. the Wisconsin and Sioux territories, and the State of Texas; S. the Gulph of Mexico; and E. the Atlantic Ocean. The total area of that portion of this vast territory which has been divided into states and territories may be estimated at about 1,100,000 sq. m., the pop., in 1840, having amounted to 17,062,546. (*See sup.*)

*Physical Geography*.—The entire territory belonging to the U. States is divided into three regions, the At-

lantic slope, the Mississippi and Missouri basin, and the Pacific slope, by two ranges of mountains, the Appalachian chain towards the E., and the Rocky Mountains in the W. The Appalachian or Alleghany chain is more remarkable for length than height; it extends from the state of Mississippi, N.E. through the states of Alabama, Georgia, Tennessee, N. Carolina, Virginia, Pennsylvania, New York, Vermont, &c., for about 1,200 m., at a variable distance of from 70 to 300 m. from the Atlantic, and consists of several parallel ranges of an average aggregate breadth of about 100 m. The mean height of the Alleghany is not more than from 2,000 to 3,000 feet, about half of which consists of the elevation of the mountains above the adjacent plain, and the rest of the elevation of the latter above the sea. The White Mountains, in New Hampshire, which belong to this chain, reach a height of more than 7,000 ft., and are the loftiest within the limit of the States. The Black Mountain, in N. Carolina, is said to rise 6,476 ft. above the sea; and many other summits reach 6,000 ft. and upwards. The Rocky Mountains are a prolongation of the great Mexican Cordillera, and of considerably greater elevation than the Appalachian chain. Their average height may be about 8,000 ft. above the Pacific, parallel to which they extend; but some of their summits attain to 10,000 or 12,000 ft. The Atlantic slope, the Alleghany, and the country nearly to the E. bank of the Mississippi, was, in its native state, almost covered by a continuous forest; and by far the greater proportion of it still remains in the same condition. West of this is the immense prairie or grassy region, of a still greater extent, and occupying all the central part of N. America to an uncertain limit northward, and westward to near the Rocky or Chippewyan chain. Here commences a barren region of sand and gravel several hundred m. in length, by, perhaps, 300 in width. The Pacific, like the Atlantic slope, of which the Columbia or Oregon territory forms a part, is densely wooded, but it is little frequented and is only partially explored.

The rivers of the United States are of prodigious magnitude and importance. The principal are the Mississippi and Missouri, which, with their tributaries, the Ohio, Arkansas, Red River, &c., give to the interior of the United States an extent of inland navigation, and a facility of communication, unequalled, perhaps, and certainly not surpassed, in any other continent. (See *ante*, p. 311.) The Alabama, Appalachicola, &c., flow, like the Mississippi, into the Gulf of Mexico; the Atamapha, Savannah, Cape Fear, Roanoke, Potomac, Susquehanna, Delaware, Hudson, Connecticut, Penobscot, &c., into the Atlantic; and the Oswego, Cuyahoga, Maumee, &c., into the great lakes of the St. Lawrence basin. Most of these rivers have been described in the articles on the several States traversed by them.

Except the great lakes Superior, Michigan, &c., in the basin of the St. Lawrence, noticed in separate articles in this work, no lake of any very considerable size is comprised within the limits of the United States. The largest is Lake Champlain, between New York and Vermont; there are, however, numerous smaller lakes in New York, Maine, and some of the other N.W. states. In the Wisconsin territory, also, W. of Lake Michigan, many small lakes are scattered over the surface; and there are a few, also, in the Oregon territory.

The coast of the Atlantic is indented by many noble bays, as those of Passamaquoddy, Massachusetts, Delaware, Chesapeake, &c.; and several extensive and sheltered inlets are formed by the islands off the coast, the principal of which are Long Island Sound, near New York, and Albemarle and Pamlico Sounds, in N. Carolina. The coast of the Gulf of Mexico, presents, also many valuable inlets and back waters; and there are some, though fewer, on the shores of the great lakes. Altogether, the United States are furnished with some of the finest harbours in the world. (*Encyc. Americana; Encyc. of Geog.*, American edit.; *Darby's View of the U. States.*)

*Climate.*—In a country extending through 20 degrees of lat., and nearly 30 of long., the climate must, of necessity, vary considerably. In the N., on the banks of the St. Lawrence, the winter is severe; during this season the snow is sufficiently abundant to admit the use of sledges, and the ice on the rivers strong enough to bear the passage of horses and wagons. In summer, on the contrary, the heat is proportionally oppressive. As far S. as New York, Pennsylvania, New Jersey, &c., the thermometer falls in winter below zero; rising, in summer, to nearly 100° Fahr. The climate of the Atlantic coast, between the 41st and 45th degrees of lat., is colder in winter and warmer in summer, by nearly 10 degrees, than the parts of Europe under the same parallels; and even at New Orleans, where the summer heats are intense, a winter seldom passes without frost. Snow, however, rarely falls further S. than lat. 30°; nor is it often seen S. of the Potomac river, except on mountains. (*Encyc. Amer.*) According to Bergius, the mean annual temp. of Albany is about 49° Fahr.; of

Philadelphia, 59°; of New York and Cincinnati, nearly 64°; of Natchez, 68°; and of Cantonment Brooke, in Florida, 79°. (*Alg. Länder, &c.*, l. 225–259.) The prevalent winds are from the N.W., S.W., and S.E. The first is by far the driest and coldest, and predominates in winter. The second prevails throughout the basin of the Mississippi for most part of the year, except during about 2 months of the winter season. The N.E. wind brings moisture, particularly in the N. part of the Union. The rains are much heavier than in most parts of Europe, resembling, rather, the torrents of tropical countries. According to Darby, the mean annual fall of rain in the United States is about 37½ inches; that of N.W. Europe amounting to 31–32 inches; but evaporation is quicker, and there are more dry days in the year in the United States than in Great Britain.

*Vegetable Products.*—The forests of the E. section of this great territory comprise 140 different kinds of trees, of which 80 are said to attain the height of 60 ft. and upwards. Among them are numerous species of oak, ash, and pine, the hickory and tulip tree, American cypress, and plane; several magnollas, walnuts, &c. In respect to its vegetable products, the country may be divided into the following regions:—

Regions.	Products.
Northern: N. of lat. 40°	Birch, American elm, red and white pine, numerous willows, sugar, and other maples; many herbaceous plants common to N. Europe and Siberia; few climbing or peculiar aquatic plants.
Middle: from lat. 40° to 35°	Numerous oaks, hickory, and ash trees, W. plane, white cedar, fewer willows, sweetgum, witch hazel, red maple, yellow birch, more climbing and herbaceous plants, and many fine flowering aquatics.
Southern: from lat. 35° to 27°	Many of the foregoing, deciduous cypres, Carolina poplar, <i>Magnolia grandiflora</i> , live oak, swamp hickory; very many climbing, herbaceous, and aquatic plants. S. of lat. 32° the character of N. America merges in that of tropical vegetation.

Apples, pears, cherries, plums, &c., flourish in the N.; pomegranates, melons, figs, grapes, olives, almonds, oranges, &c., in the S. section. Maize is grown from Maine to Louisiana, and wheat throughout the Union; tobacco as far N. as about lat. 40°, and in the W. States S. of Ohio. Cotton is not much raised N. of 37°, though it grows to 39°. Rice is cultivated in Carolina, Georgia, Louisiana, and as far N. as St. Louis in Missouri. The sugar-cane grows as high as 33°, but does not thoroughly succeed beyond 31° 33'. The vine and mulberry tree grow in various parts of the Union; oats, rye, and barley in all the N. and the mountainous parts of the S. states; and hemp, flax, and hops, in the W. and middle states. The cultivation of these crops, &c. will be treated of hereafter.

The *Animal Kingdom* comprises the bison (*Urus Americanus*), which is found roaming over the vast plains W. of the Mississippi, in herds, conjectured sometimes to amount to 10,000 head; the moose, or American elk (*Cervus alces*), the prong-horned antelope, peculiar to N. America; the Virginian deer, cougar, black and grisly bears, American fox (*Vulpes fulvus*), racoon, opossum, beaver, skunk, glutton, &c. Among the birds are the white-headed eagle, several vultures, and a great number of birds common to the old world, though few of the wading species resemble those of Europe. The alligator (*Crocod. lucius*) is a native of the S. states, but does not occur N. of the Carolinas and the Red River. The rattlesnake is among the serpents of the United States, and the *siren* is a native of the muddy pools of Georgia and Carolina. Cod, mackerel, salmon, &c. abound on the shores; and shell-fish are particularly abundant in the rivers of the Mississippi basin. The domestic animals of the States are the same as in Europe. (*Encyc. of Geog.*, Amer. edit.)

*Geology and Minerals.*—The White Mountains consist of granite, which is also very prevalent in the greater part of New Hampshire and Maine. Silente, porphyry, and greenstone occur in the N.W. part of the Appalachian chain; gneiss forms the upper regions in New York and New Jersey; most of the mountain summits S. of the Juniata river consist of fossiliferous sandstone; and talcose mica, chlorite, and other slates, with crystalline limestone and argillaceous, lie along the W. side of the primary belt, in the middle and S. parts of the Union. Blue limestone, red sandstone, shales, anthracite, coal measures, and other transition formations, flank these rocks in many places. Secondary strata occupy by far the largest portion of the U. States; but no strata corresponding in date with the new red sandstone or oolitic groups of Europe appear to be present. Tertiary formations, many of which abound with fossil remains, have

been found in many parts of the Atlantic slope, and in Alabama, &c.; in the S. part of the Mississippi basin; but they seem to be almost exclusively confined to those regions. The most extensive and remarkable alluvial tract is that around the mouth of the Mississippi. If we except a few small insulated fields, all the bituminous coal in the U. States lies W. of the Appalachian chain, where a vast series of coal-beds stretch from the mountains westward through Ohio, Indiana, and Illinois, and parts of Kentucky and Alabama, into the state of Missouri, and even as far as 200 m. beyond the Mississippi! The coal best suited for manufactures, &c., lies at the N. extremity of this great field, in Pennsylvania, and in the W. part of Virginia, the E. part of Ohio, and Illinois. Numerous salt springs exist in New York, Virginia, Pennsylvania, and the W. states. Iron is distributed most abundantly through the coal measures in Pennsylvania, Ohio, Virginia, Tennessee, &c., where the ore contains from 25 to 33 per cent. of metal, though it has hitherto been little wrought. It also abounds in the N.W. states, and in one part of Vermont the ore is said to yield 78 per cent. of iron of the best quality. A large proportion of the ore found in this part of the Union is magnetic. The produce of pig iron, in 1830, was estimated at 191,836 tons; and as the make has increased rapidly in the interval, it may now (1842) be probably estimated at 300,000 tons. Lead is next in importance: it is found in various places, especially in Missouri, the Wisconsin territory, and Illinois; and its average annual produce may be estimated at about 32,000,000 lbs. In some parts of the Wisconsin territory the lead ore is so very rich as to yield from 60 to 70 per cent. of lead. Gold has been found in certain parts of Virginia, both Carolinas, Georgia, and Tennessee; but its importance has been much exaggerated: the value of the quantity produced, which, in 1834, amounted to 898,000 doll., had fallen off in 1840 to 176,766 doll. Copper, zinc, manganese, with lime, building-stone, &c., constitute the other chief mineral products. Substances of volcanic origin appear to be rarely, if ever, found in the U. States E. of the Hokey Mountains. We subjoin the following returns with regard to mines and mineral products, as ascertained by the marshals employed to take the late census:—

## MINES.

IRON.	Forces	814
	Tons of cast iron produced	286,963
	Forces and rolling-mills	795
	Bar iron produced, tons	197,253
	Tons of fuel consumed	1,528,110
	Number of men employed	34,497
	Capital invested	20,452,131 dolla.
LEAD.	Smelting-houses	120
	Pounds produced	31,239,453
	Number of men employed	1,017
	Capital invested	1,546,756 dolla.
COAL.	Anthracite coal, tons	865,089
	Men employed	5,345
	Capital invested	4,756,802 dolla.
	Bituminous coal, bushels	27,603,191
	Men employed	5,768
	Capital invested	1,108,162 dolla.
SALT.	Bushels produced	6,179,174
	Men employed	2,565
	Capital invested	6,998,045 dolla.

**Population.**—The progress of population in the U. States has been rapid beyond any previous example. This, however, may be easily explained, from the peculiar circumstances under which they have been placed. They have the good fortune to possess an all but boundless extent of fruitful soil, and a climate which, as it is, speaking generally, neither too hot nor too cold, is most favourable to the exercise of industry; they are, also, well situated for commerce, and enjoy an almost unequalled extent of inland navigation; and at the period of its discovery this vast country, possessing such natural advantages, was occupied only by a few thousand miserable savages. The colonists who left this country to settle in America had, therefore, after the difficulties incident to the foundation of the first settlements had been got over, unparalleled opportunities for increasing in wealth and population. They carried with them the science and the arts of the most civilized nations of the old world; and they applied them to the culture of a virgin and unoccupied soil. Each colonist got as much land as he could cultivate or occupy without being subject to any charge for lordship or rent, at the same time that his taxes were quite inconsiderable. In fact, all that the colonists had to do was to provide for their internal government, as Britain took upon

herself and defrayed the cost of their defence against foreign aggression. She, also, supplied them with manufactured products at the lowest possible rates, so that they were able to apply all their energies to agriculture, which, under the circumstances, was especially profitable. In such a state of things, the demand for labour could not be otherwise than astonishingly great; for a high rate of wages, combined with a facility of procuring land, speedily changes the labourers into landlords, who, in their turn, become the employers of fresh labourers. Under such circumstances every man might enter into matrimonial engagements without being deterred, as in old settled and densely peopled countries, by the fear of not being able to provide for the children that might be expected to spring from them. In America, indeed, and in all similarly situated countries, a large family is a source of wealthy marriages, in consequence, are at once comparatively general and early. And in addition to the extraordinary stimulus thus given to the principle of population in the United States, they have been ever since their settlement a "land of promise," to which industrious and ambitious individuals in depressed circumstances have been emigrating from Europe; and they have, also, been a "city of refuge," in which the victims and the foes of political or religious intolerance have found a secure asylum.

It is true that the progress of population in the *ci-devant* Spanish colonies has been much less rapid than in the English colonies; but the differences in their situation have not been less considerable than the points of resemblance, and are quite sufficient to account for the different rate at which their population has increased. The Spanish colonists were placed under the most degrading system of civil and religious intolerance; their industry and freedom of action were interfered with in a thousand different ways; and all emigration to them from foreign countries, and, in fact, all intercourse with the latter was strictly prohibited. The English colonies, on the other hand, have always enjoyed a remarkably free system of government; their mental and physical energies have been allowed to expand without let or hindrance; and they have been always open to all classes and descriptions of immigrants, not from England only, but from all the world. We need not, therefore, wonder at the more rapid progress of the latter, or at the fact that they have gone on for a lengthened period doubling their population once in every 25 years!

It is, however, to be observed, that this rate of increase, though it prevails at an average of the entire Union, does not prevail in each particular state. Indeed the western are now, in respect to the eastern states, what the latter formerly were in respect to Europe,—a field to which the impoverished, enterprising, industrious, and adventurous are glad to resort. There is, in fact, a constant emigration current setting from the eastern to the western states. And hence, while population is now but slowly increasing, in the old settled parts of the country, it is advancing with unprecedented rapidity in the valley of the Mississippi, and the territory to the W. of that great river. And the fair presumption is that this progress will continue till the country be occupied westward to the Pacific, or which is the same thing, till the existing facilities for the support and employment of additional inhabitants begin to fail; when new habits and a slower rate of increase will, no doubt, also, begin to manifest themselves. We subjoin a

STATEMENT exhibiting the Area of the different States and Territories comprised within the limits of the Union in 1840, with the Progress of Population in each from 1790 downwards.

States and Territories.	Area in Sq. m.	Population.					1840.			Pop. to Sq. m. in 1840.	
		1790.	1800.	1810.	1820.	1830.	Males.	Females.	Total.

† Not slaves, but "indented coloured servants."

We borrow from the American edition of the *Encyclopædia of Geography* the following details with respect to slavery in the U. States:—

Slavery has been abolished in the eastern states, and prospectively in New York, Pennsylvania, and New Jersey, and has never been permitted in the north-western states. By the laws of Pennsylvania, all persons born within that state since 1790 are free, but the children of a slave are subject to a limited servitude to her owner. In New Jersey, every child born in the state after July 4. 1804, is declared to be free, and the traffic in slaves between that and other states was prohibited in 1798. The revised laws of New York declare that every person born in that state is free, and that all persons brought into the state, except for a limited period, become free; and no person can sell any other person in that state. Provision is, however, made in these and the other non-slaveholding states for the delivery of runaway slaves from the other states. The ordinance for the government of the territory north-west of the River Ohio passed in 1797 prohibits for ever the introduction of slavery into that tract of country, in which four states have

already been formed with this prohibition incorporated in their constitution. The introduction of slaves from abroad was prohibited by Virginia in 1798, and by Congress into the Mississippi Territory in the same year. In 1808 the importation of slaves into the U. States was forbidden; and it is believed that the number since clandestinely introduced into the country has been very small. Slavery may be said to exist in thirteen states: Delaware, Maryland, Missouri, Arkansas, and all the states S. of the Potomac and the Ohio. The slaves form rather more than one third of the whole pop. in the states in which the institution exists, but they are unequally distributed, although the white pop. generally predominates. In Missouri, Tennessee, and Kentucky, the whites are to the slaves in the proportion of about 4 to 1; in Maryland, of about 3 to 1; in North Carolina, of about 2 to 1; and in Virginia, rather less; in Georgia, Alabama, and Mississippi, the whites are little superior, and in South Carolina and Louisiana, a little inferior, in number to the slaves. Louisiana and other states have prohibited the introduction of slaves from the other states, except by an immigrant proprietor; but there is an active traffic in

slaves carried on between the different states, consisting chiefly in their exportation from the worn-out tracts of more northern and eastern to the new cotton lands of the southern districts.

"In the slave-holding states slaves are chattels personal, except in Louisiana, and, with certain qualifications, may be sold to pay the debts and bequests of their master. Slavery is hereditary, and the servitude of the mother determines that of the child. When a coloured person claims to be a freeman, the burden of proof is thrown upon him, his colour being, *a priori*, a sufficient indication of slavery. The life and person of the slave are protected by law under the same penalties as those of whites, but the master or overseer may punish minor offences by flogging; for greater offences, the slaves are tried by justices of the peace and from two to five freeholders. The slave can make no contracts, nor can he legally hold any property: the instruction of slaves is prohibited by law, but they often receive some education from the members of the family, and they are generally allowed to attend public worship, which must be conducted by a white. There are in all the states restraints upon manumission, as a pop. of free blacks is felt to be dangerous to the subordination of the slaves. Although some of the laws relating to slaves are severe, it is to be observed that many of these are not enforced, or are of very rare application. There are various laws restraining cruel punishments or tasks, and prescribing suitable food and clothing for the slaves; but their best security is in the force of custom and public opinion, and in the humanity and interest of their masters. They are in general humanely and even kindly treated, well fed, and lightly worked; they are commonly allowed a little patch of ground to cultivate for their own benefit; they may raise poultry and hogs, which, with the produce of their farm, they may sell to the family or elsewhere at their option; in this way they often acquire a little property, or expend their earnings in ornaments. It is a sufficient proof of their general ease in this country, that their numbers have increased with amazing rapidity, and that many of them live to a great age. 'All these,' says Paulding, 'who have visited the states in which slavery prevails, whatever may have been their previous impressions of the horrors of that condition, must have been struck with the uniform hilarity and cheerfulness which prevail among the blacks. Labouring generally in large numbers together, they partake of the influence which companionship always exercises over man, the most social of all beings. In the meadows and harvest fields they lighten their labours by songs, the measures of which accord with the strokes of the cradle and scythe; and in whatever employment they may be associated, they are always joking, quizzing, or bantering each other. The children enjoy a life of perfect ease, and are maintained by the products of the land which belongs to them and theirs. The parents, being freed from all anxiety or exertion for the present or future support of their offspring, are never beset by the gnawing cares of the free white man, whose whole life is one continued effort to provide for himself and his children. The aged and infirm are also taken care of by the master, either from the dictates of his own humanity, or the obligation imposed on him by law.'

"The slaves do not work on Sundays, and they have generally several days at Christmas, Easter, and Whitsuntide, and often other holidays. The usual hours of labour are from sunrise to sunset, — with about two or three hours' intermission at breakfast and dinner, according to the season and the nature of the work; they frequently gain a day by doing the task of three days in two, and women with a certain number of children are allowed some further indulgences. Their food and clothing vary in different sections of the country, but they generally receive from nine to twelve quarts of Indian corn a week, with bacon and salt fish; instead of the corn, a bushel of sweet potatoes or two pecks of paddy are given by way of change, and on the rice plantations rice is the principal article of food. For clothing each man receives six or seven yards of woollen cloth, each woman five or six, and the children in proportion; a new blanket is given to each grown person, and one for every two children, once in two years, and in winter a handkerchief is given to the women, and a cap to the men. A suit of cotton or linen clothes is also allowed in summer. On every plantation there is a nurse, and the overseer has a chest of medicines. The marriages of the slaves are merely a connection subsisting during pleasure. Their amusements are chiefly music and dancing, many of them being able to play and sing in a rude manner."

But this, though on the whole a pretty fair statement, certainly sets the condition of the slaves in too favourable a point of view. The truth is, that the American legislators have done but little for the protection of the slave against the tyranny and caprice of his master; and that little is in a

great measure defeated by the prejudices of the people, and the difficulties which the partiality of the law throws in the way of getting evidence sufficient for the legal conviction of a master of whose guilt no doubt can be entertained. We do not, however, suppose that acts of cruelty and ill treatment are more common in the U. States than in most other countries where slavery exists; but it is idle to imagine, where there is such tremendous power on the one hand, and nothing but abject submission on the other, that the former should not be sometimes abused.

But if the treatment of slaves by their masters be, on the whole, favourable, nothing can be said in favour of their treatment by the law. Whether it be that the rapidly increasing magnitude of their numbers has alarmed the legislatures of the states in which they are most numerous, or that they are resolved that slavery shall be maintained at all hazards without any relaxation, certain it is that the legal condition of the slaves has, in most of the slave-holding states, been latterly altered for the worse; and that few or no measures have been taken either for their moral or religious improvement. In 1830, the legislature of Louisiana passed certain laws in relation to slaves, in which, among other things, their instruction in reading and writing is expressly forbidden; and in which the penalty of death, or of imprisonment at hard labour for life, or, at least, for three years, is denounced against every one who shall print, publish, or distribute anything "having a tendency" to create insubordination among the slaves, or who shall use any language in any public discourse from the bar, the bench, the stage, or the pulpit, or in private, having the above-mentioned tendency! (*Stuart's America*, ii. 208.) And laws of an equally severe character have been enacted in most of the other slave-holding states. People of colour, including all who have any taint, how slight soever, of African blood, are, also, almost everywhere treated with contempt, and are deprived of various privileges enjoyed by the whites.

It is as impossible to foresee, as it would be presumptuous to conjecture, how this state of things may terminate. It seems, however, to be reasonable to suppose, seeing the rapid growth of the black population, that it will be extremely difficult to maintain the existing constitution of society, without incurring the most imminent hazard of servile wars and of the most formidable outrages. But it is easier to point out the probable consequences of maintaining the present order of things, than to suggest the means by which they may be obviated. This is a problem that has puzzled, and will, no doubt, continue for a lengthened period to puzzle, American legislators and philosophers. But, perhaps, on the whole, the best and safest plan would be gradually to modify the severity of the laws against blacks, to hinder the separation of families, to endeavour to improve their moral and religious habits, to enable them to accumulate a little property, and to train them up for that entire or modified emancipation which sooner or later most likely awaits them. The subject, however, is one that should be approached with extreme caution. And though we do not state it in the view either of justifying the existence of slavery or of extenuating the abuses to which it has given rise, it will, we apprehend, be found to be impossible to continue the cultivation of the southern states on the same scale and with the same vigour that it is now conducted without the aid of slaves of one kind or other. The climate is too hot and the labour too

severe to be voluntarily undertaken. It has, we are aware, been alleged over and over again, that slavery has retarded the progress of Virginia, the Carolinas, and other S. states. But there is really no foundation whatever for this allegation. New York and the middle and northern states, that have so rapidly advanced without the aid of slaves, are placed under totally different circumstances. They are to Louisiana, Alabama, Mississippi, &c., what England is to Jamaica. Branches of industry suited to the one are not suited to the other; and that field labour which may, without difficulty, be carried on in the New England states, New York, and Pennsylvania, would be oppressive and all but intolerable in the states lying along the Gulf of Mexico. But, as stated above, we do not mention this in vindication of slavery, or as an apology for the cruelties of slave-masters. This probable consequence of the abolition of slavery should, however, be kept in view by those who would fairly estimate its real influence. The dangers of rebellion, anarchy, and bloodshed, are not the only contingencies American statesmen have to guard against in dealing with the blacks; they must, also, keep in view the probable influence of their acts on the productive energies and trade of the country; and should endeavour, in as far as possible, to combine with the maintenance of the latter a proper respect for the rights and interests of humanity.

The rapid increase of population, and particularly the continual extension of the white settlers further W. will, ere long, go far to extinguish the native races. The Sioux Indians, estimated at 27,000 or 28,000, still hold their ground W. of the Mississippi; and nearly all the region from that river to the Rocky Mountains, and from the Arkansas to the head waters of the Missouri, are inhabited by nations more or less connected with them; but of the tribes formerly inhabiting the country E. of the Mississippi, few remnants exist. Of the Iroquois and Algonquins, there are now estimated to be only about 8,000 individuals in all, chiefly in New York, and the New England States. Further S. a few Cherokees, Chickaws, &c. still occupy their original seats; but a war of extermination has been lately carried on against the Indians of Florida, provoked in a great measure by their hostility to the whites; and it is stated, that "from the Tennessee to the Lakes, and from the Des Moines to the Gulf of Mexico, scarcely a drop of Indian blood remains within the limits of the States." (*Encyc. of Geog.*) The Indians who remain within the limits of the States are allowed to retain their own government, laws, &c., but inducements have been held out to them either to become citizens of the states in which they reside, or to emigrate to the Platte country, W. of Arkansas and Missouri, where lands have been provided for the purpose; and where they are supplied with agricultural implements, and other necessities of civilized life. In 1836, about 31,300 Indians had migrated thither; and the number remaining within the States at the same period was estimated at rather more than 150,000.

**Land and Agriculture.**—In the N. states, extensive landholders are not common; and where they exist, a great part of their possessions is unproductive. The soil is chiefly cultivated by its owners, who in many respects resemble the tenants of Scotland, and often perform a great portion of the manual labour of the farm. But in many parts of the country, which have been long settled, the farmers are opulent, and hire a good deal of labour; and in the more recently settled tracts they do not labour hard after the first 3 or 4 years from their settlement. (*Shirreff's Tour in N. America*, p. 340.) In the S. states are larger; and in the rice plantations of Louisiana, a single field sometimes comprises 300 or 400 acres! (*Plin.*) The price of land is very variable: near Philadelphia land of fine quality and in high condition may be had at from 100 to 120 dollars an acre; but there produce of all kinds fetches a high price; and the straw of a wheat crop has been sold at 30 dollars per acre. In some parts of New York, as near Canandaigua, 25 doll. an acre is asked for fine cleared land; but in other parts of the same state land is sometimes sold by auction at 14 doll.; and Mr. Shirreff attended a sale in New York at which 25,000 acres in the co. St. Lawrence were knocked down in one lot at 1s. 14d. sterling per acre! (*Shirreff*, p. 216.) Almost every farmer in the E. states who has a family, or is in straitened circumstances, is willing to sell his land, and move to the W. states, where he can

obtain soil of an equal or better quality, and in a finer climate, usually at one twentieth part of the price. In Michigan, &c., though the prairie lands sometimes fetch from 3 to 6 doll. an acre, the government upset price is only 1½ doll.; and the rich land in Illinois, and elsewhere in the Union, is often to be had at the same low rate. The terms of rent, at least in the N., are almost equally variable. Near towns, and in thickly peopled districts, a small rent is paid in money, and a lease of several years taken. In remote situations, land is commonly let in shares from year to year. If the owner of the soil furnish seed and labouring animals, he gets two thirds of the produce; if the tenant supply animals and seed, the landowner gets one third. But terms may vary according to situation, soil, and crop." (*Shirreff's N. America*, *passim*.)

The quantity of land unoccupied within the U. States and territories was, in 1835, estimated at 220 millions of acres; besides that in the subject Indian territory to the W., which, in fact, is as much at the disposal of the government of the U. States as the unoccupied lands to the E., of the Mississippi, and which is supposed to comprise above 750 millions of acres. From 1833 to 1840, 56,842,806 acres of land within the limits of the States were sold by the central government at prices which realized to the treasury 72,269,750 doll. (*See post*.) But the extent of cleared land is still quite inconsiderable, as compared with the whole surface. It is principally in the country E. of the Alleghanies, where all the land worth occupying belongs to private individuals. But even of this, a great part is covered with forest; and in all situations near a village, or where there is ready access to water-carriage, forest land is more valuable than that which has been cleared, fuel, in many places, having lately become dear. Except on the banks of the rivers, the soil E. of the mountains is generally so inferior, that much of the land covered with wood is not worth cultivating; and should the trees be cut down, it is likely to remain in pasturage, or be preserved as a forest for the production of new trees. The price of farms, however, varies from 5*l.* to 30*l.* an acre, according to the quality of soil, buildings, and situation. This part of the States has a comparatively abundant supply of labour, and a ready market for all kinds of produce. Market-gardening and dairy husbandry are here the most profitable branches of industry.

The soil W. of the Alleghanies is generally much superior to that on their E. side; and large tracts produce, for a while at least, Indian corn and wheat without manure. Almost all the land in the E. part of this region belongs to private individuals, though a large proportion be still covered with forest trees. On the W. side of the Mississippi the greater part of the country is public property; but in either case great quantities of land are always in the market. Labour can generally be had, except in the extreme W. Farm produce is in constant demand, and prices are regulated by the markets of New Orleans, to which it is sent down by the Mississippi; these being in part governed by the prices on the E. coast, and in part by those in the Havannah and other great W. Indian ports. Manures are seldom used except near the larger towns. The price of farms of an equal quality of soil vary according to their distance from the means of transport, from a dollar to 12*l.* the acre. The money wages of labour may be stated to be nearly the same from the E. to the extreme W., any difference being towards a rise in the W. But land is there so cheap, that every prudent labourer is able to purchase a farm for himself in a year or two, and it is only the imprudent who continue labourers. (*Shirreff*, 395—396.)

Speaking generally, agriculture is little known as a science in any part of America, and but imperfectly understood as an art; and it could not rationally be expected that it should be otherwise. In all those countries in which, as in the greater part of America, portions of fertile, and unoccupied land may be obtained for little more than a nominal price, the invariable practice is, after clearing and breaking up a piece of land, to subject it to a course of continuous cropping; and when it is exhausted, to resort to some other tract of new ground, leaving that which has been abandoned to recover itself by the aid of the *vis medicatrix nature*! But in those parts of the Eastern or Atlantic states that have been long settled, and are fully occupied, this scouring system can no longer be advantageously followed; and there, consequently, a better system of agriculture has been introduced; and the rotation of the crops, and the manuring of the land are generally practised, sometimes with more and sometimes with less care and success. Still, however, it is certain that even in the best farmed districts agriculture here is very backward; and in the W., and other newly settled districts, it is conducted on the scouring ambulatory principle previously noticed. In the neighbourhood of New York, clover-fields, when the grass is worn out, are ploughed and sown with Indian corn, not manured; they grow potatoes with manure in the second year; followed, if early, by buck-wheat: in the

third year barley; and in the 4th, oats, accompanied with grass-seeds. Potatoes are grown in drills, as in Britain. According to the official returns, there were raised in the Union, in 1840, 108,298,060 bushels potatoes. Near Philadelphia, and in many other parts of the Union, Mr. Stuart says that, in appearance at least, the farms and buildings are like those seen in England and Scotland, except that thorn hedges and other fences are often wanting. According to the official returns the total produce of wheat in the Union, in 1840, amounted to only 84,832,272 bush., or 10,604,034 quarters.

Maize is the great staple of American husbandry, and it grows on soil, not particularly rich, as respects other products for a succession of years without manure, in all the vigour and luxuriance of an indigenous plant. It has been justly called the "meat, meadow, and manure" of the farm, as it is used for both human food and the

supply of the farm stock in winter; and furnishes more nourishment for man and beast on a given acre, and with less labour, than any other bread-corn. But it is not successfully cultivated beyond lat. 43° N., where it begins to be superseded by the grains of Europe. The total produce of maize in the Union, in 1840, was estimated by the marshals, under the census, at 377,531,875 bush. Tennessee is the principal maize-growing state; and next to it are Virginia, Ohio, Indiana, Illinois, &c.

The surface of the New England States is often hilly, and the soil rocky, or of the most inferior kind of sand. The principal crops here are oats for horses, &c., and rye for distillation; and perhaps the corn produce of these states barely supports their inhabs. Boston, the largest corn and flour importing port in the Union, receives nearly all her supplies of these articles from the S. states. We subjoin

An Official Account of the Produce of the principal Corn Crops raised in the greater number of the States, in 1840, as ascertained by the Marshals appointed to take the Sixth Census.

Tobacco is grown from lat. 39° or 40° throughout all the S., and in a part of the W. states; it is the staple produce of Maryland and Virginia, where it is raised than in any other part of the Union. The tobacco of the U. States is of very superior quality; but it is a crop which scourges the land, and the labour attending its cultivation is very severe. (See Virginia.)

Cotton and rice are the great staples of the S. part of the Union: the former has even supplanted the culture of tobacco in some of the cos. of Virginia.

A little cotton had been raised for domestic use, in the Southern states, previously to the revolutionary war, but its produce was quite inconsiderable. In 1791 it began, for the first time, to be exported; the trifling quantity of 189,316 lbs. having been shipped in the course of that year, and 138,328 lbs. in 1792. Such was the late and feeble beginning of the American cotton trade! And we are warranted in saying that there is nothing in the history of industry to compare with its subsequent progress and extension, unless it be the growth of the manufacture in this country.

American cotton, the produce of the *Gossypium herbaceum*, is of two kinds, generally known by the names of *sea island* and *upland*. The former grows along the low sandy islands off the shores of Carolina, Georgia, &c. It is long in the staple, has an even silky texture, a yellowish tinge, is easily separated from the seed, and is decidedly superior to every other description of cotton hitherto brought to market. Unluckily, however, it can be raised only in certain situations; so that its quantity is limited, and has not, in fact, been at all increased since 1805. At present 97 or 98 per cent. of the cotton produced in the United States consists of what is denominated upland, from its being grown on the comparatively high ground at a distance from the coast. Though of varying qualities, it is all short-stapled, and its separation from the seed and pod, if attempted by the hand, is so very difficult, that the cotton is hardly worth the trouble and expense. This, however, was the only way in which it could be made available for home use.

or exportation, in 1791; and had any one then ventured to predict that 10,000,000 lbs. of upland cotton would ever be exported, he would have been looked upon as a visionary. But the genius and talent of Mr. Eli Whitney did for the cotton planters of the United States what Arkwright did for the manufacturers of England. He invented a machine by which the cotton wool is separated from the pod, and cleaned with the greatest ease and expedition; and in this way may be said to have doubled the wealth and industry of his countrymen. (*Pike's Statistics of the United States*, p. 109, ed., 1835.) Mr. Whitney's invention came into operation in 1793; and, in 1794, 1,601,760 lbs., and in 1795, 5,276,300 lbs. of cotton were exported! The effect of the machine has been, like that of Arkwright's, all but miraculous. The exports of cotton from America, during the year ending 30th of Sept., 1810, reached the enormous amount of 743,941,061 lbs.; worth, when shipped, 63,870,307 dollars! And it is not going too far to say that, had not Whitney's, or some equivalent machine been invented, there is no reason to think that the exports, during the above year, would have exceeded 45,000,000 lbs., if so much, so that the existence of the other 700,000,000 lbs., with the greater part of that retained for home consumption, may be ascribed to Mr. Whitney's machine, as to its real source and origin. The total crop of cotton in the United States at this moment (1842) be estimated at 1,200,000,000 lbs. It is generally exported in bales, firmly packed, and containing each about 330 lbs. The quantity of cotton produced per acre varies, according to the American edition of the *Encyc. of Geog.*, on good lands, from 250 to 300 lbs., and on inferior lands from 125 to 150 lbs.

Rice is produced chiefly in S. Carolina. It was introduced into the States in 1694 from Madagascar, and has since succeeded so well, that, besides supplying the home consumption, from 100,000 to 140,000 tonnes, worth from 2 to 2½ million dollars, are exported yearly. "The usual time of planting rice is from the 20th of March to the 20th of May, and the harvest begins about Sept. 1. No grain yields more abundantly. From 40 to 70 bushels an acre is an ordinary crop; but 80 and 90 bushels are often produced on strong lands, having the advantage of being overgrown by a rice or reed sward. The water is not let in upon the field till after the second hoeing, and is kept on frequently for 30 days." (*Stuart*, ii. 89.) The sugar cane grows in low and warm situations as high as lat. 33°, but the climate does not suit it well N. of 31°. 30°. In Louisiana, however, it is cultivated with success, and in 1840, about 155,000,000 lbs. sugar, with a proportional quantity of molasses were raised in that state. Several varieties of the cane, as the African, Otahite, W. Indian, and Ribband, are grown. The last is the most prolific of juice, and, according to Mr. Stuart, an acre of ground, properly managed, will yield a hhd. of sugar. (ii. 156.) In the N. part of the Union, as in Canada, maple sugar, a saccharine matter derived from maple trees, either growing wild or cultivated for the purpose, is extensively collected. The trees are tapped two or three inches into the wood to obtain the sap, from which the sugar is extracted, some time in February or the beginning of March. The holes are made in a slanting direction, in which sprouts of alder or sumach are placed; but they are plugged up as soon as the sap is drawn. The tree does not become impoverished by repeated tapplings. There are instances on the Hudson, where the process has been continued for 50 years." (*Stuart*, i. 74, 75.)

Indigo was formerly raised in Georgia and Carolina, but its culture has been superseded by that of cotton. Some good wine has been produced in the same states; and the vine and mulberry tree are common in many parts of the Union, without, however, having yet become objects of much attention. Fruits of most temperate and tropical climates, and European vegetables, thrive well. The apples grown in the vicinity of New York are decidedly the best variety of the fruit that is anywhere to be met with. Hemp, flax, hops, &c., are frequent crops in the N. and W. states.

Mr. Shirreff speaks disparagingly of the cattle and sheep of the Eastern states. Near New York, he says, the cattle grazing on the scanty herbage appeared mere starvelings, and smaller than some of the highland cattle of Scotland. The sheep were even more miserable-looking than the cattle; pigs corresponded; and the horse alone formed an exception to the general wretchedness, some fine animals of this species being met with. The same appeared to him to be the case in the New England States, sometimes even on superior farms, and with cattle originally of a good breed. This inferiority of the cattle in the Eastern states has, however, been satisfactorily explained by Mr. Jefferson: "In a thinly-peopled country, the spontaneous productions of the forests and waste fields are sufficient to support indifferently the domestic animals of the farmer, with very little aid from him, in the severest and scarcest season. He, therefore, finds it more convenient to receive them from the hands of nature in that indifferent

state than to keep up their size by a care and nourishment that would cost him much labour." (*Notes on Virginia*, p. 90.) This, no doubt, is the cause of the lean and wretched condition of the cattle in most parts of the Atlantic states; but wherever the pastures are of especial excellence the cattle are comparatively good; and, luckily, fine grass lands are not unfrequently even in the old settled states. Mr. Shirreff says of the Genesee flats in the state of New York, "Perhaps no gentleman's park in Britain equals them in fertility and beauty. They differ from the rest of the surface in this part of the country, in having been cleared by nature; and are chiefly in grass, affording the richest pasture I ever saw, with the exception of some fields in the neighbourhood of Boston in Lincolnshire." (*Tour*, p. 84.) But the great cattle-breeding states are in the W.; and herds of some thousands are brought up from Kentucky, &c., for sale at New York. They bear some resemblance to the Hereford cattle, and when 4 or 5 years old are estimated to weigh at an average 80 stone. (*Ibid*, p. 32.) On the improved farms, the sheep are mostly crosses of the Saxon and Merino; for, though the Leicester and Cotswold breeds are reared, the former, particularly if pure, is not found to answer. In 1840 the U. States are said to have possessed 19,311,374 sheep, producing 35,802,114 lbs. of wool; Illinois appears to be the state best adapted for sheep, as it is for most other species of husbandry; and so much of its surface remains to be disposed of, that, estimating the fleece of a Merino sheep at 3 lbs., and its price at 60 cents the lb., the wool of one sheep in a year will nearly purchase ¼ acre of land! Wool can be transported from Illinois to the E. states for 3 or 4 cents per lb. (*Shirreff*, p. 457.)

According to the official returns, the live stock of the Union, in 1840, were:—

Horses and mules	-	-	-	1,353,669
Neat cattle	-	-	-	14,971,586
Sheep	-	-	-	19,311,374
Pigs	-	-	-	26,301,295
Value of Poultry	-	-	-	9,344,410 dolrs.

The condition and mode of life of the agricultural pop. is very different in different parts of this extensive region. The N. E. states, the oldest settled portions of the country, bear the greatest resemblance to Great Britain. The villages of New England are uniformly clean, airy, and neat, with spacious openings near the centre, in which churches form the most prominent feature. The houses are, in some instances, built of brick, but more frequently of wood, painted white, and with green Venetian blinds opening to the outside. Both churches and dwelling-houses seem to be painted annually; at least they are never seen in the slightest degree dingy coloured. The houses of every size and fabric have a light appearance from the number of windows they contain. They seldom indicate either extensive wealth or poverty in the inmates, and the villages want only the judicious aid of flowers and shrubs to render them beautiful." (*Shirreff*, p. 52.) Landscape gardening, and similar ornamented work, is, however, very backward in America.

In the newly settled states of the W., the farmer must dispense with much of the civilisation of the E., and live in his log house with a few necessary articles of furniture, in the rudest and most primitive manner. But if his style of life be less comfortable, he reaps the benefit of his privations in a more rapid accumulation of wealth. "The settler of Illinois places his house on the forest or on the open field as fancy may dictate. The prairie furnishes summer and winter food for any number of cattle and sheep, and poultry and pigs shift for themselves until the crops ripen. With the preliminary of fencing, the plough enters the virgin soil, which, in a few months afterwards, yields a most abundant crop of Indian corn, and, on its removal, every agricultural operation may be executed with facility. Pastoral, arable, or mixed husbandry, may be at once adopted, and produce of all kinds obtained in profusion." (*Shirreff*, p. 459.)

The agricultural labourers of the U. States are well fed, and generally efficient. Mr. Shirreff states, that, near Philadelphia, a cradler or mower boarding with another labourer, and paying 45 cents a day, would breakfast at 7 o'clock on wheat or rye bread, fish, cheese, butter, and coffee; lunch at 10 on cold meat, pickled pork, cheese, butter, pickles, bread and coffee; dine at 12 on every thing good and substantial; at 5 take coffee, with bread, butter, fruit, and fruit pie; and occasionally have supper at 7, though this meal is considered superfluous. (P. 25.) Generally, however, the labourers do not fare quite so well. The hours of labour are usually from sunrise to sunset. Near New York farm labourers get from 10 to 12 dollars a month, with bed and board, including washing; spademen get 75 cents a day, without board, all the year round. Near Philadelphia, wages are about the same. In Michigan, where labour is scarce, a good farm help obtains 120, and an indifferent one 100 dollars a year, with bed and board; and a female help receives, in private families, one dollar a week. An or-

inary farm labourer in Illinois gets the value of 80 acres of land a year: in Britain, due allowance being made for the board of the labourer, he does not get 1-10th of the value of an acre of good land; so that when wages are compared with land, the farm labourer of Illinois is about 800 times better rewarded than in Britain! (*Shirreff*.) This, however, does not show that labour is better paid in America than in England; but that there land is very cheap, and here very dear. As respects clothing and lodging, the English labourer is better off than the American. For further particulars we refer the reader to the articles on the several States in this work.

**Manufacturing Industry** in the United States, though, of course, very considerable, is carried on under several disadvantages incident to their situation. The fact is that, under the peculiar circumstances in which America is placed, agriculture is necessarily the most advantageous employment in which her population can engage; and it is a short-sighted, false, policy to endeavour, by dint of custom-house regulations, to force up a manufacturing interest. The boundless extent of her fertile and unoccupied land gives her extraordinary advantages as compared with almost every other people in respect of agriculture; but she has no such advantage as regards manufactures; and yet it is plain that, unless the work-people engaged in manufactures in different parts of the Union realised the same rate of wages, and the capitalists the same rate of profits that is realised by the workmen and capitalists engaged in agriculture, they would either never engage in the former, or speedily abandon it for the latter. Hence the futility of all attempts to establish the finer branches of manufacture in America, without burdening similar articles when imported from abroad with heavy duties. The coarser description of articles, or those which are bulky and heavy, and in which the value of the raw material exceeds the value of the workmanship must, of course, in America as elsewhere, be always produced at home. But the finer description of goods, or those of which the value or price is principally made up of wages and profits, would, but for the interference of Congress, be wholly imported from countries in which wages and profits are comparatively low. And it is needless to say, that every attempt to limit or hinder such importation is inconsistent with and subversive of every sound principle. If the cotton and woolen manufactures now carried on in the United States cannot exist without a duty of 25 or 35 per cent. being laid on foreign cottons and wools, it is plain that the existence of such manufactures obliges every individual in the United States to pay from 25 to 35 per cent. additional price for every yard of their produce that he has occasion to use! And even this is not all; for the prohibition withdraws a large portion of the public capital and industry from employments in which America has an advantage to make them be vested in employments in which the advantage is on the side of others!

The commercial policy of America is, in truth, but little creditable to her people and legislature. The prohibitions that have so long fettered the employment of industry, and the growth of commerce in Europe, grew up in a comparatively dark and unenlightened age, and have for many years been progressively declining. But America has been foolish enough to adopt the prohibitory and forcing system after its *feto de se* character had been fully demonstrated. She has not acted in ignorance, but in contempt of well-established principles and of the most comprehensive experience; and has consequently involved herself in difficulties and losses of which

it is not easy to estimate the extent nor to foresee the termination.

No doubt America will gradually become more and more suitable for manufacturing industry; and her command of water-power and of coal, and her facilities for internal transport and navigation, are circumstances eminently favourable to manufactures. Still, however, it is certain that her natural progress to manufacturing eminence cannot be hastened but must, in fact, be retarded by the policy on which she has embarked. When population has become dense in America, and her unoccupied land has been generally appropriated, she will necessarily undertake, and will no doubt successfully carry on, such branches of manufacturing industry as are suitable to her peculiar capabilities; but this natural development of her maturer growth must be waited for; and though it may be delayed cannot be forwarded by interfering with the free exercise of industry.

Pitkin estimated the total value of the manufactures of the U. States in 1835, at from 325,000,000 to 350,000,000 dollars. The first cotton-mill was established at Providence, in 1790, but power-looms were not introduced till 1815. A convention held at Harrisburg in 1832 put forth the following statement respecting the cotton manufacture of America in 1831. But as this convention was held for the express purpose of endeavouring to procure additional support and encouragement for the manufactures of the Union, the fair presumption is that it will rather have exaggerated its importance and value.

STATEMENT, exhibiting the Number of Manufacturing Establishments, the Capital employed, and the Raw Cotton wrought up, in the Cotton Manufacture of the States of Virginia, Maryland, Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, and Delaware, in 1831, with the Number of Persons employed in the same, and other Particulars.

Capital	-	-	dols.	40,614,984
Number of mills	-	-	-	793
Number of spindles	-	-	-	1,216,503
Number of looms	-	-	-	33,506
Yarn sold	-	-	lbs.	10,642,000
Cloth	-	-	yds.	230,461,290
Cloth	-	-	lbs.	59,601,926
Males employed	-	-	-	18,539
Wages per week (Massachusetts) dols.	-	-	-	38,927
Females employed	-	-	-	2-25
Wages per week (Massachusetts) dols.	-	-	-	4,691
Children under twelve years	-	-	lbs.	77,757,816
Cotton used	-	-	do.	1,641,355
Starch used	-	-	do.	17,845
Flour for sizing	-	-	barrels	46,319
Wood	-	-	cords	24,480
Coal	-	-	tons	9,205
Charcoal	-	-	bushels	500,338
Oil	-	-	gallons	599,923
Value of other articles	-	-	dols.	174,024
Spindles building	-	-	-	4,760
Hand-weavers	-	-	-	117,626
Total dependants	-	-	-	26,000,000
Annual value	-	-	dols.	10,294,344
Aggregate wages	-	-	do.	

The returns collected under the late census exhibit the following particulars with respect to the cotton manufacture of the U. States in 1840:—

Factories	-	-	-	1,210
Spindles	-	-	-	2,284,631
Dyeing and printing works	-	-	-	129
Persons employed	-	-	-	72,119
Capital invested	-	-	-	51,102,499 dols.
Manufactures, value of	-	-	-	46,550,455 do.

Sheetings, shirtings, printed calicoes, jeans, sail-cloth, &c. are among the principal cotton fabrics produced in the Union; but though substantial and durable, they are mostly of a coarse quality, the American manufacturers being unable to come into competition with our own in the finer description of goods. Lowell (which see), in Massachusetts, is the chief seat of the cotton manufacture.

The manufacture of woollens has been extensively carried on from an early period, in the colonisation of the States: but it is principally conducted in private families; and it is only in recent times that woollen factories have been established on any large scale. In 1836, the excess of the imports of fine wool in the U. States over the exports is stated to have been 1,390,674 lbs., and of coarse wool 10,905,571 lbs. The quantity of wool manufactured in families, chiefly in the states of New York, Pennsylvania, and Ohio, was then estimated at 8,500,000 lbs.; and at the same period there existed 1,549 sets of m

chinery (mostly in Massachusetts, New York, &c.) Broad cloths, cassimeres, satinetts, flannels, jeans, linseys, blankets, yarn, and carpets are the goods principally made.

The returns under the late census as to the woollen manufacture are as follows:—

Pulling-mills	-	-	2,585
Woollen manufactories	-	-	1,420
Persons employed	-	-	21,512
Manufactures, value of	-	-	80,509,509 dolls.
Capital invested	-	-	15,765,124 do.

The manufactures of leather, and articles made of leather, of linen and linen yarn, iron and hardware, glass, soap, candles, &c., are all carried on pretty extensively; but we have no estimates of their amount on which it would be safe to rely. Steam-engines, and all kinds of machinery, nails, fire-grates, and stoves, chain cables, agricultural and mechanical implements, fire-arms, &c., are extensively manufactured; but all the finer descriptions of hardware and cutlery, and a great variety of hardware articles, are imported from England. In 1840, according to the census, there were 10,306 distilleries in the United States, producing in that year 41,402,627 gallons spirits. N. Carolina had the greatest number of these establishments; but the greatest quantity of spirits was distilled in the States of Pennsylvania, Massachusetts, and New York. It has been said that the consumption of spirits in the U. States has declined, in consequence of the spread of temperance; but however this may be, the foregoing return shows that the consumption continues to be enormous.

The shot, and red and white lead manufactured in the States, now nearly supply their consumption. About 6,000,000 bushels salt are estimated to be annually made from brine-springs. But, notwithstanding, about 8,000,000 bushels salt are annually imported, principally from Great Britain, but partly, also, from Spain and Portugal.

**Commerce.**—The trade of the U. States is very extensive. The great article of export is cotton wool, the value of the exports of which, in 1840, amounted, as already seen, to \$3,470,307 dolls., being considerably more than half the value of the entire exports (of domestic growth) from the Union. Indeed, the astonishing increase in the production of cotton, and in the demand for it in foreign countries, has been the principal cause of the rapid growth and vast magnitude of American commerce. Cotton is principally shipped for the United Kingdom, France, and Germany. Next to cotton, the great articles of export are wheat flour, Indian corn, and provisions; tobacco, raw and manufactured; rice; the produce of the American fisheries; timber, lumber, &c. The flour and provisions are partly sent to Europe, but principally to Cuba, Brazil, and the W. Indies generally, which are also the great mart for lumber. Tobacco is principally sent to England and Holland. The

exports of manufactured goods from the U. States are comparatively trifling; the value of those of cotton amounted, in 1840, to 3,549,607 dolls.

The great articles of importation are manufactured products, including cottons, woollens, linens, hardware, and earthenware, principally from England; silks and wines, from France and Spain; tea from China; sugar and coffee from Cuba and Brazil; linens and woollens from Germany; salt from England and Portugal; with spices, dye-stuffs, and an infinite variety of other articles from all parts of the world. We subjoin some statements illustrative of the progress and present magnitude of American commerce.

**SUMMARY STATEMENT** exhibiting the Value of the Articles of Domestic and of Foreign Growth and Manufacture exported from the United States, during each Year, ending on the 30th September, from 1803 down to 1840; with the Value of the Imports during the same Years:—

Years	Value of Exports in Dollars.			Value of Imports in Dollars.
	Domestic.	Foreign.	Total.	
1803	12,205,561	13,591,072	25,796,633	64,666,666
1804	11,167,177	36,251,597	47,418,774	85,000,000

A very large proportion of the commerce of the U. States is carried on in native ships, and the mercantile marine of the Union is inferior only to that of the U. Kingdom. We subjoin

An ACCOUNT of the total Tonnage of the American Mercantile Marine, from 1830 to 1840, both inclusive.

Years.	Tons.	Years.	Tons.
1830	1,191,776	1836	1,882,103
1831	1,267,846	1837	1,806,686
1832	1,439,150	1838	1,995,610
1833	1,604,150	1839	2,000,479
1834	1,758,907	1840	2,180,764
1835	1,821,940		

*Internal communications.*—Nowhere in the world, a few parts of Europe excepted, have such extensive canals, and other public works been undertaken and completed as in the U. States; and those within a very short period. "The zeal with which the Americans undertake, and the rapidity with which they carry on every enterprise, which has the enlargement of trade for its object, cannot fail to strike all who visit the U. States as a characteristic of the nation. Forty years ago the country was almost without a light-house, and now no fewer than 200 are nightly exhibited on its coasts; 30 years ago it had but one steamer and one short canal, and now its rivers and lakes are navigated by between 500 and 600 steamers, and its canals are upwards of 2,700 m. in length; 10 years ago there were but 3 m. of railway in the country, and now there are no less than 1,600 m. in operation.\* Nor are the labours of the people at an end; for even now there are no fewer than 33 railways in an unfinished state, the aggregate lengths of which, when completed, will amount to upwards of 2,500 m." (*Stevenson's Civil Engineering of N. America*, 1838.) The whole of the S.E. quarter of Pennsylvania, with the adjacent parts of New Jersey, Delaware, and Maryland, is one continued network of canals and railroads; and similar works exist, more or less, in nearly all the States; but particularly in those of New York, Ohio, Virginia, S. Carolina, and New England. The great length of many of the U. States' canals is one of their most remarkable features, in which they far surpass any hitherto constructed in Europe. The Erie Canal, connecting Lake Ontario with the Hudson River, is 363 m. in length, or very materially more than twice as long as Canal of Languedoc, the longest of which Europe can boast. Generally, however, they are deficient in breadth and depth for the increased traffic conducted by their means; several of them have, however, been enlarged.

The tolls paid to the State, by the persons who have boats on these canals, are 1 $\frac{1}{2}$ d. per mile for each boat, and a small charge per mile for each passenger conveyed. The passenger-boats vary from 12 to 15 ft. in breadth, and are 80 ft. in length; the large-sized boats weigh about 30 tons, and cost about 250 $\frac{1}{2}$  each. They are usually dragged by three horses, which run 10 m. stages, and the rate of travelling is from 4 to 4 $\frac{1}{2}$  m. an hour. Except in the most S. part of the Union, the canal navigation, as well as that on the rivers and lakes in the N. States, is completely suspended for from three to five months a year during winter, and then the water is always withdrawn from the canals and feeders.

The internal improvements of the United States are placed under the management either of the legislature of the state in which the works are situated, or of joint-stock companies. Those constructed by the states are called state-works, and are conducted by commissioners chosen from the different legislatures. The joint-stock companies, on the other hand, are composed of private individuals, who, as in Britain, receive a charter from the government empowering them to act accordingly.

At first view, a person from England is struck by the temporary and apparently unfinished state of many of the American works; in which it is in vain to look for

\* The American Almanack for 1841, pp. 160–165, quoting Taylor, Sec. of the Canal, &c., states the aggregate length of the canals in the U. S. at 3,909 m., and that of the railroads at 5,320 m.; but many of the works enumerated are not yet completed, and some not mentioned are in progress.

greater number that stopped for a while and afterwards resumed payments. Various complicated schemes for insuring the stability and prudent management of banks have been devised; but, as they all involve regulations which it is impossible to enforce, they are practically worse than useless. In Massachusetts, for example, it is provided that no bank for the issue of notes can go into operation in any way until at least half its capital stock be paid in gold and silver into the bank, and be actually existing in its coffers, and seen in them by inspectors appointed for that purpose; and the cashier of every bank is bound to make specific returns once a year of its debts and assets, on being required to do so by the secretary of state. But our readers need hardly be told that these elaborately contrived regulations are really good for nothing, unless it be to afford an easy mode of cheating and defrauding the public. Instances have occurred of banks having borrowed an amount of dollars equal to half their capital for a single day, and of such dollars having been examined by the inspectors appointed for that purpose, and reported by them, and sworn by a majority of the directors, to be the first instalment paid by the stockholders of the bank, and intended to remain in it. (*Gough's Paper Money and Banking in the U. States.*) We do not, of course, imagine that such disgraceful instances can be of common occurrence; but what is to be thought of a system which permits a company for the issue of paper money, founded on such an abominable fraud, to enter on business with a sort of public attestation of its respectability? The publicity, too, to which the American banks are subject is injurious rather than otherwise. Those who are so disposed may easily manufacture such returns as they think most suitable to their views; and the more respectable banks endeavour, for a month or two previously to the period when they have to make their returns, to increase the amount of bullion in their coffers by temporary loans, and all manner of devices. The whole system is, in fact, bottomed on the most vicious principles. The facility, too, with which loans may be obtained from the different banks in periods of prosperity tempts private individuals and associations, and even states, to engage in the wildest and most gigantic projects. But whenever a pressure for money occurs, fresh supplies being no longer obtainable, those who depend on the banks are involved in the greatest difficulties, while the latter, being unable to procure payment of their advances, and having, in most instances, no sufficient capital, are obliged forthwith to suspend their payments. Perhaps no instance is to be found in the history of commerce of such a wanton over-issue of paper as took place in the U. States in 1835 and 1836; and the revulsion to which it necessarily led after producing a frightful extent of bankruptcy and suffering in all parts of the Union, compelled, in May, 1837, every bank within the states, without, we believe, a single exception, to suspend payments! In 1838, such of them as were not entirely swept off resumed specie payments; and in 1839, by far the larger number of them, with the bank of the U. States at their head, again suspended payment!

The Bank of the United States had a *bond fide* paid-up capital of no less than 35,000,000 doll., the whole, or nearly the whole, of which immense sum has been lost! It would be out of place to enter into any detailed statement explanatory of the various circumstances that have contributed to the downfall of this establishment. Something, no doubt, must be attributed to the hostility of General Jackson and the government; but the real cause of the catastrophe must be sought for in the mismanagement of the directors, and in the vices inseparable from the American banking system.

Unfortunately, however, there seems little reason to expect that this system will be speedily amended. The only effectual cure for the evil would be the suppression of all local issues of paper, leaving it to be wholly supplied, in exchange for bullion or other convertible securities, by a single central bank, and in an alteration of the law of partnership as respects banks of deposit. But there is not the smallest probability that any measure of this sort, if proposed, would ever be agreed to; and there can be no doubt that, in time to come, as in time past, each state will zealously patrol its own banking system; that the Union will continue to have hundreds or rather thousands of issuers of money; and that those periodical alternations of extreme prosperity and all but universal bankruptcy we have hitherto witnessed will continue, for a lengthened period, to delight and disgrace the republic.

**Coins.**—The American gold coin, the Eagle, contains 232 gr. pure gold and 36 alloy. This coin is made the equivalent of 10 dollars, so that the English sovereign is equal to 4 dolls 87 cents. The doll. is worth at par about 4s. 6d. Weights and measures same as in England.

The Government, as established in 1787, is a federal democracy. The legislative power is vested in the Congress, an assembly of two separate bodies, the Senate and the H. of Representatives. The Senate consists of 62 mems., 2 from each State, chosen for a term of six years

by the legislatures of the several states they represent. The qualifications necessary for a senator are the having attained the age of 30 years, having been a citizen of the U. States for 9 years, and being an inhab. of the state for which he is elected. The Senate has a concurrent vote in the ratification of treaties and executive nominations, and the sole power to try impeachments. One third of its number goes out of office every two years. The H. of Representatives is composed of mems. from the several states, elected by the people for the term of 2 years. According to an act of Congress, 1 representative is returned for every 47,700 of the pop. (5 slaves being reckoned equivalent to 3 free persons); and the present regular number is, accordingly, 242 representatives, besides 3 delegates, 1 from each territory. The qualification for representatives is, their having attained the age of 25 years, and been 7 years citizens of the U. States. This house has the sole power of impeachment, and of originating money-bills. Congress must assemble at least once a year, on the first Monday in Dec. Each house chooses its own speaker and other officers; the president of the senate being the vice-president of the U. States. Both houses are divided into a number of committees for the despatch of business, chosen by ballot. The mems. of both houses receive a salary of 8 dollars a day during their attendance, and travelling expenses of 8 dollars for every 20 m. The speakers of both houses have 16 dollars a day. The executive power is vested in the president, who is chosen by the electoral colleges of the several States for the term of 4 years; he must be 35 years of age, and a natural-born citizen who has resided for 14 years in the U. States. The president is commander-in-chief of the land and sea forces; and has power to make treaties, and appoint to the principal civil and military offices in the states, with the consent of the senate. He has a veto on bills which may have passed both houses of Congress, though if these be passed a second time by a vote of two thirds of each house, they become law without his sanction. His salary is 25,000 dollars a year. The president is assisted by a cabinet of six ministers, who hold office during his pleasure: the secretary of state, the secretaries of the treasury, war, and navy, the postmaster-general, and the attorney-general, the salaries of each being 6,000 dollars a year. Besides the General Congress, each state has its own separate senate and H. of Representatives, elected by its inhabs. The qualifications of electors are not the same in every part of the Union; and respecting them we refer the reader to the arts. on the several States. The individual States are in many respects independent as to their internal administration; but no State can enter into any treaty or alliance with any foreign power, grant letters of marque and reprisal, coin money, emit bills of credit, grant titles of nobility, &c. &c.

In order that the reader may be fully acquainted with the institutions and government of the U. States, we subjoin a copy of the general constitution of the Union, as agreed upon in 1787, and of the amendments that have since been made upon it.

#### CONSTITUTION OF THE UNITED STATES.

WE, the people of the U. States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defence, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the U. States of America:—

##### ARTICLE I.

SECTION I. All legislative powers herein granted shall be vested in a Congress of the U. States, which shall consist of a Senate and House of Representatives.

SECTION II. 1. The House of Representatives shall be composed of members chosen every second year by the people of the several states; and the electors in each state shall have the requisite qualifications for electors of the most numerous branch of the state legislature.

2. No person shall be a representative who shall not have attained to the age of 25 years, and been seven years a citizen of the U. States, and who shall, when elected, be an inhabitant of that state in which he shall be chosen.

3. Representatives and direct taxes shall be apportioned among the several states which may be included within this union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the U. States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of representatives shall not exceed one for every thirty thousand, but each state shall have at least one representative; and until such enumeration shall be made, the state of New Hampshire shall be entitled to choose 3; Massachusetts, 8; Rhode Island and Providence Plantations, 1; Connecticut, 5; New York, 6; New Jersey, 4; Pennsylvania, 8; Delaware, 1; Maryland, 6; Virginia, 10; North Carolina, 5; South Carolina, 5; and Georgia, 3.

4. When vacancies happen in the representation from any state, the executive authority thereof shall issue writs of election to fill such vacancies.

5. The House of Representatives shall choose their speaker and other officers; and shall have the sole power of impeachment.

SECTION III. 1. The Senate of the United States shall be composed of two senators from each state, chosen by the legislature thereof, for six years; and each senator shall have one vote.

2. Immediately after they shall be assembled, in consequence of the

**SECTION III.** He shall, from time to time, give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may, on extraordinary occasions, convene both Houses, or either of them, and in case of disagreement between them, with respect to the adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; and he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

**SECTION IV.** The President, Vice-President, and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

#### ARTICLE III.

**SECTION I.** The judicial power of the United States shall be vested in one supreme court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office.

**SECTION II.** 1. The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority;—to all cases of admiralty and maritime jurisdiction;—to controversies to which the United States shall be a party;—to controversies between two or more states;—between a state and the citizens of another state;—between citizens of different states;—between citizens of the same state claiming lands under grants of different states, and between a state or the citizens thereof, and foreign states, citizens, or subjects.

2. In all cases affecting ambassadors, other public ministers, and consuls, and those in which a state shall be party, the supreme court shall have original jurisdiction. In all the other cases before mentioned, the supreme court shall have appellate jurisdiction, both as to law and fact, with such exceptions, and under such regulations, as the Congress shall make.

3. The trial of all crimes, except in cases of impeachment, shall be by jury; and such trial shall be held in the state where the crime shall have been committed; but when not committed within any state, the trial shall be at such place or places as the Congress may by law have directed.

**SECTION III.** 1. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort.

2. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court. 3. The Congress shall have power to declare the punishment of treason, but no attainder of treason shall work corruption of blood, or forfeiture, except during the life of the person attainted.

#### ARTICLE IV.

**SECTION I.** Full faith and credit shall be given in each state to the public acts, records, and judicial proceedings of every other state. And the Congress may, by general laws, prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

**SECTION II.** 1. The citizens of each state shall be entitled to all privileges and immunities of citizens in the several states.

2. A person charged in any state with treason, felony, or other crime, who shall flee from justice, and be found in another state, shall, on demand of the executive authority of the state from which he fled, be delivered up, to be removed to the state having jurisdiction of the crime.

3. No person held to service or labour in one state, under the laws thereof, coming into another, shall, in consequence of any law or regulation therein, be discharged from such service or labour, but shall be delivered up on claim of the party to whom such service or labour may be due.

**SECTION III.** 1. New states may be admitted by the Congress into this Union; but no new state shall be formed or erected within the jurisdiction of any other state, nor any state be formed by the junction of two or more states, or parts of states, without the consent of the legislatures of the states so concerned, as well as of the Congress.

2. The Congress shall have power to dispose of and make needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be construed as to prejudice any claims of the United States, or of any particular state.

**SECTION IV.** The United States shall guarantee to every state in this Union a republican form of government, and shall protect each of them against invasion; and on application of the legislature, or of the executive (when the legislature cannot be convened), against domestic violence.

#### ARTICLE V.

The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of two thirds of the several states, shall call a convention for proposing amendments, in which case any amendment shall be valid to all intents and purposes, as part of this Constitution, when ratified by the legislatures of three fourths of the several states, or by conventions in three fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided that no amendment, which shall be made prior to the year 1808, shall in any manner affect the 1st and 4th clauses in the 9th section of the 1st article; and that no state, without its consent, shall be deprived of its equal suffrage in the senate.

#### ARTICLE VI.

1. All debts contracted, and engagements entered into, before the adoption of this Constitution, shall be valid against the United States under this Constitution as under the Confederation.

2. This Constitution, and the laws of the United States which shall be made in pursuance thereof; and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every state shall be bound thereby, any thing in the constitution or laws of any state to the contrary notwithstanding.

3. The senators and representatives before mentioned, and the members of the several state legislatures, and all executive and judicial officers, both of the United States and of the several states, shall be bound by oath or affirmation to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

#### ARTICLE VII.

The ratification of the conventions of 9 states shall be sufficient for

the establishment of this Constitution between the states so ratifying the same.

Done in convention, by the unanimous consent of the States present, the 17th day of Sept., in the year of our Lord 1787, and of the Independence of the United States of America the 12th. In witness whereof we have hereunto subscribed our names.

GEORGE WASHINGTON, President,  
and Deputy from Virginia, &c.

*Congress at their first session under the Constitution, held in the city of New York, in 1789, proposed to the legislatures of the several States, 12 amendments, 10 of which only were adopted. They are the first 10 of the following amendments; and they were ratified by three fourths of the constitutional number of States, on the 25th of Decr. 1791. The 11th amendment was proposed at the first session of the third Congress, and was declared in a message from the President of the U. States to both Houses of Congress, dated the 8th of Jan. 1798, in have been adopted by the constitutional number of States. The 12th amendment, which was proposed at the first session of the eighth Congress, was adopted by the constitutional number of States, in the year 1804, according to a public notice by the Secretary of State, dated the 25th of September, 1804.]*

#### AMENDMENTS

To the Constitution of the U. States, ratified according to the Provisions of the 5th Article of the foregoing Constitution.

**ARTICLE I.** Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

**ARTICLE II.** A well regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed.

**ARTICLE III.** No soldier shall, in time of peace, be quartered in any house, without the consent of the owner, nor in time of war, but in a manner to be prescribed by law.

**ARTICLE IV.** The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

**ARTICLE V.** No person shall be held to answer for a capital, or otherwise infamous, crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service in time of war or public danger; nor shall any person be subject for the same offence, to be twice put in jeopardy of life or limb; nor shall be compelled, in any criminal case, to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

**ARTICLE VI.** In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the state and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favour, and to have the assistance of counsel for his defence.

**ARTICLE VII.** In suits at common law, where the value in controversy shall exceed 20 dollars, the right of trial by jury shall be preserved; and no fact tried by a jury shall be otherwise re-examined in any court of the U. States than according to the rules of the common law.

**ARTICLE VIII.** Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

**ARTICLE IX.** The enumeration, in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

**ARTICLE X.** The powers not delegated to the U. States, by the Constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people.

**ARTICLE XI.** The judicial power of the U. States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the U. States by citizens of another state, or by citizens or subjects of any foreign state.

**ARTICLE XII.** The electors shall meet in their respective states, and vote for electors for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same state with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall be distinct ballots for all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists shall be signed and certified, and transmitted sealed to the seat of the government of the U. States, directed to the President of the Senate. The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted;—the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose the President, by ballot. But in choosing the President, the voters shall be the President. But in choosing the President, the voters shall be taken by states, the representation from each state having one vote; a quorum for this purpose shall consist of a member or members from two thirds of the states, and a majority of all the electors. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the 4th day of March next following, then the Vice-President shall act as President, as in the case of the death or disability of the President. The person having the greatest number of votes for Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed, and if no person have such majority, then from the two highest numbers on the list, the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two thirds of the whole number of senators, and a majority of all the electors shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the U. States.

The fact that the legislature, and that all the principal officers of the government, from the president downwards, are chosen by a widely

extended system of election, constitutes the distinguishing characteristic of the American constitution. Any lengthened inquiry into the advantages and disadvantages of such a form of government would, perhaps, be foreign to our subject; and would, at all events, be incompatible with our limits. It is sufficient to observe that, as the suffrage in the greater number of the states is now nearly or completely universal, the legislature and officers of government, as well of separate states as of the Union, are chosen rather by the numerical majority than by the intelligence of the country. It has, it is true, been contended in an able, though partial article on the U. States, in the new edition of the *Encyclopædia Britannica*, that, "when the people have a free choice, they will always prefer merit to demerit." And no doubt this would be the case provided they could readily distinguish between the merit and demerit of the parties soliciting their suffrages. But how are they to do this? how are they to discriminate between the tares and the corn? between protestations and realities? between a simulated zeal for the public interests and a secret determination to prostitute them to selfish ends? Every one knows that the most popular individuals are not always, nor even frequently, the most deserving; but those who can best contrive to recommend themselves, whether by worthy or unworthy means, to the favour of the public. This, no doubt, is an evil that is, partially at least, inherent in all elective systems; but it becomes more obvious the lower the suffrage is extended, and the greater the number of the electors. The bulk of the latter can then know but little of the private history, connections, and real character of the candidates for their favour; and having, in the great majority of instances, nothing better to trust to than protestations and promises, are often deceived in the estimate they form of those whom they choose for representatives. In the election to the highest offices, such as those of president and vice-president, which are chosen by the whole Union, the inconvenience now stated is not so much felt; for, before a man can aspire to such offices, he must have been for a lengthened period before the public, and have, consequently, afforded them the means of making a pretty fair appreciation of his public principles and conduct. But in the case of the representatives sent to the legislature of the different states, and those selected to fill local offices, the principle now noticed does not apply. In these the electors always have been, and, it may safely be affirmed, always will be caught by the same baits; declamatory harangues, violent party demonstrations, and specious, though hollow, promises, will too frequently succeed where talents, knowledge, good sense, and integrity are disregarded.

The universality of the franchise in the U. States, and the frequency of elections, have the advantage of keeping the public attention alive to political matters; but this, on the other hand, keeps up the most violent party contentions; and too frequently tempts one or other party, in difficult exigencies, to resort to unjustifiable proceedings. The tyranny of a majority may be quite as oppressive as that of a despot. And where the government is so entirely dependent on the democracy, it dares not take any course, how just soever or expedient, that might clash in any way with popular prejudices. In its results, at least, the *vox populi* is here the *vox Dei*; and as it is very apt to be influenced by sudden impulses, injustice is apt to be committed before

time is given for reflection, or a fair estimate can be formed of the consequences of measures. In proof of what is now stated we may refer to the recklessness which the greater number of the separate states evinced of late years in the contraction of debts; and the still more shameless effrontery with which several of them have refused, notwithstanding their undoubted ability, to make good the engagements into which they had so recently entered. The mere populace has, in fact, far too much influence in America; and the government will never be secure, nor able to act consistently on just and sound principles, till this influence be diminished.

The division of the Union into separate states, each of which is, as it were, a semi-independent republic, with its local government and legislature, has some advantages, but many more defects. It enables the private and peculiar affairs of the different states to receive that proper attention that could hardly be expected from a general government, and in so far is beneficial: on the other hand, however, it weakens, and indeed goes far to nullify, the authority of the central government in the transacting of the public business of the Union. The fact of all its local and private business being transacted at home makes each state regard itself rather as an independent community than as a portion of one great empire. Owing, also, to the vast extent of the Union, the inhab. of its different states have but little intercourse with each other; and their interests as regards foreign countries may not unfrequently have little in common, and be even opposed to those of their fellow-citizens in some other quarter. What interest, for example, can the Southern States take in the question as to the boundary of Maine? and supposing the negotiations respecting it were unhappily to terminate in war, is it to be supposed that Louisiana, Alabama, and other states along the Gulf of Mexico, should submit to the burdens and privations it would bring along with it, for a matter in which they really have very little, if any, interest? Again, in the case of the *Creele*, which is of importance only to the slave-holding states, is it to be supposed that their pretensions should be abetted by those who repudiate slavery?

But apart from these prominent causes of dissension, it seems pretty clear in the event of the central government getting, on whatever grounds, into a dispute with a foreign power, that their opponents would gain a majority in the legislatures of some of the states, and it is impossible to say to what lengths faction and party spirit might carry them. The general opinion is, and we believe that it rests on a solid foundation, that had the last war with this country been protracted for a year or two longer, and been conducted with proper vigour on our part, it would have occasioned a disruption of the Union. In fact, the latter could not exist for any length of time were the country surrounded, like the European states, by other independent and formidable nations; and even as it is, the different interests of the different states, and the necessity of obviating, in as far as possible, the causes of disagreement, obliges the central government to adopt a timid and tentative policy, and deprives it of the greater portion of the weight and influence it would certainly enjoy were its action at home less impeded.

Even if a purely democratic government had been more successful in America than it appears to have been, that would be but a slender re-

commendation in its favour. There are so many important circumstances of a special and peculiar character in the condition of America, that it would be rash in the extreme to infer that institutions suitable for her would answer equally well in other countries. The extraordinary facilities for obtaining wealth and the means of subsistence in the U. States render universal suffrage incomparably less dangerous there than it would be in old settled, and densely-peopled countries. The people in the former are not exposed to those severe distresses and privations which they frequently suffer in the latter; and that incomparably larger proportion of their number who are dependent on the land are always sure to obtain a pretty ample share of, at least, the necessities of life. They have, therefore, but little motive to interfere with the rights of property, or to adopt any violent means for improving their own condition at the expense of their neighbours. Certainly, however, the conduct of some of the states in repudiating their debts shows what might be expected from them, had they any very conspicuous objects of attack, were distress at all prevalent. We do not, however, think that in this respect the Americans are at all worse than others; and our conviction is, that if we had the same sort of ultra-democratical government in England that exists in the U. States our national debt would be very speedily wiped off, and our large estates parcelled out into more convenient portions. The American institutions are not very unsuitable for a country where property is generally diffused; and where, owing to the abundance of fertile and unoccupied land, every industrious man may become independent: but they are wholly unsuitable for countries in the condition of most of those in Europe. Can any one doubt that if those who have nothing were permitted to legislate for those who have, as would be the case if we were subject to the curse of universal suffrage, a division of property would be the inevitable consequence?

The *judiciary power* of the United States resides in a supreme court at Washington, and 35 district courts, one or more in each separate state, and the district of Columbia. The supreme court consists of a chief justice with a salary of 5,000 doll., and at present (1842) eight associate judges, who each receive 4,500 doll. a year. The United States are divided into nine circuits, which are travelled separately twice a year by the judges of the supreme court; and the circuit courts have jurisdiction in all criminal cases, and in civil causes to the amount of more than 500 doll., and, in some cases, exercise a jurisdiction of appeal from the inferior courts. The laws of the United States are bottomed upon the common and statute law of England; but capital punishments are less frequently resorted to than they used to be in this country.

On the whole, however, we apprehend it cannot be denied that the administration of justice in the U. States labours under several, and those probably incurable, defects. Party-spirit, which is the bane of all free countries, runs very high in America, and in cases involving political considerations jurors are very apt to be biased, and the most obvious principles of justice are too often sacrificed to the most unworthy feelings and prejudices. In the Southern and Western States the existence of slavery, the weakness of the government, and the turbulent unruly character of many of the settlers, oppose the most formidable obstacles to the due administration of the laws; and the fact is, that the most barbarous actions, and crimes of the utmost atrocity, are there frequently perpetrated with impunity. This weakness of the law keeps alive, and, in some degree, excuses the practice of *Lynch law*, or the execution of summary justice by the populace upon individuals whose offences the law might not be able to reach. It is not easy, however, to say whether the toleration of such a practice, or the negation of all law, be preferable. Numerous instances may, no doubt, be specified, in which notorious offenders, who would otherwise have escaped all punishment, have, through the intervention of *Lynch law*, suffered the

penalty due to their crimes; but, on the other hand, it exposes all individuals who have, how undeservedly soever, become objects of popular aversion and dislike, to the most serious danger; and instances have not been wanting, especially in the southern States, in which individuals have met with the most savage treatment, and even been put to death, for manifesting some little interest in the fate of the blacks, and some wish to meliorate their condition!

The truth is, where so much power is conceded to the lower classes as in the United States, the administration of justice must always be liable to great abuse. Juries chosen from among the people must necessarily be influenced to a greater or less extent by the feelings and prejudices prevalent amongst the class from which they are taken. In Great Britain jurors are selected from among the middle classes, and are not, therefore, so apt to be swayed by popular enthusiasm, at the same time that the station, authority, and learning of the judges give them an influence over juries which it were idle to suppose should be enjoyed by such functionaries in the U. States. Many of the latter, indeed, are chosen for short terms only by popular election, and carry to the judgment-seat all those narrow party views that recommended them, in the first instance, to the support of their friends. It is true there have been, and still are, numerous judges in the U. States, whose learning and judicial talent would do honour to any country; but this is not, and cannot be, the general character of this class of functionaries when chosen under such a system as prevails in America.

*Public Instruction* is nowhere more extensively diffused than in the N. part of the Union; and the education in the common schools is of the best description. Their attention to the education of the people, and the liberal provision made to insure that grand object, are most creditable to the American legislators. Every where in New England, except in Connecticut, the primary schools are supported by a property tax; and some of the States have school funds in addition, the income of which is distributed among the towns in proportion to the number of pupils educated. The common or public free schools are managed in each district by 12 directors, chosen by the people; and the children are taught gratuitously, the only expense being for books. Each town has one of these schools, and one is generally established in every rural district of 5 or 6 sq. m. The instruction which is thus brought as it were within reach of every body, embraces the rudiments of English education, including arithmetic and geography; and in the larger towns Latin and Greek.

The principles of this system, its adaptation to the peculiar circumstances of the country, and its probable influence over the character and condition of the people, were set in the most striking point of view, in a speech delivered by Mr. Webster, in an assembly held in Massachusetts in 1821:—"For the purpose of public instruction," said he, "we hold every man subject to taxation in proportion to his property, and we look not to the question whether he himself have or have not children to be benefited by the education for which he pays; we regard it as a wise and liberal system of policy, by which property, and life, and the peace of society, are secured. We seek to prevent, in some measure, the extension of the penal code, by inspiring a salutary and conservative principle of virtue and of knowledge in an early age. We hope to excite a feeling of respectability and a sense of character, by enlarging the capacities and increasing the sphere of intellectual enjoyment. By general instruction we seek, so far as possible, to purify the moral atmosphere; to keep good sentiments uppermost; and to turn the strong current of feeling and opinion, as well as the censures of the law, and the denunciations of religion, against immorality and crime. We hope for a security beyond the law and above the law, in the prevalence of enlightened and well principled moral sentiment. We hope to continue and to prolong the time, when, in the villages and farm-houses of New England, there may be undisturbed sleep within unbarred doors. Knowing that our government rests directly upon the public will, that we may preserve it we endeavour to give a safe and proper direction to that public will. We do not, indeed, expect all men to be philosophers, or statesmen; but we confidently trust, and our expectation of the duration of our system of government rests upon that trust, that by the diffusion of general knowledge, and good and virtuous sentiments, the political fabric may be secure, as well against open violence and overthrow, as against the slow but sure undermining of licentiousness. We rejoice that every man in this community may call all property his own, so far as he has occasion for it to furnish for himself and his children the blessings of religious instruction and the elements of knowledge. This celestial and this earthly light he is entitled to by the fundamental laws. It is every poor man's undoubted birthright; it is the great blessing which this constitution has secured to him; it is his solace in life,

and it may well be his consolation in death, that his country stands pledged, by the faith which it has pledged to all its citizens, to protect his children from ignorance, barbarism, and vice."

Out of New England an adequate provision for public schools exists in all the populous states, as Pennsylvania, New Jersey, Maryland, Virginia, &c.; and whites may overy where procure free education. In the newly settled States the provision for the support of common schools has been settled by Congress; and every township is divided in 36 sections of a sq. m. each, one of which is appropriated to the support of schools. The land set apart for educational purposes in the new states E. of the Mississippi already amounts to 8,000,000 acres. (*Stuart*, i. 319, &c.) We have previously seen, that the blacks are not permitted to share in the advantages of education; and if it be determined, *coulx qui coule*, to retain them in their present abject state of slavery, this regulation cannot, perhaps, be fairly objected to. But its modification or repeal should certainly precede any attempts to improve their condition, or to invest them with any portion of the rights and privileges enjoyed by the whites.

Superior instruction is, also, provided for in the most liberal manner, partly by the central and local governments, and partly by private individuals and associations. Academies of various degrees of excellence are found in every part of the Union. In these the ancient and modern languages, grammar, history, logic, rhetoric, natural and moral philosophy, &c., are taught. There are, besides, above 170 colleges and universities, supported by different religious denominations or by the States; and, in the more populous parts of the country, there are but few districts of any considerable extent without one or more of these institutions. The principal are Harvard University, in Massachusetts, Yale College, in Connecticut, Dartmouth Union, Rutgers's College, &c. There are about 40 theological, 30 medical, and 10 law schools, the last of which are much the least frequented.

According to the returns under the census, there were in the Union, in 1840—

Universities and Colleges	173
Students	16,253
Academies	3,212
Students	164,139
Primary Schools	47,209
Scholars	1,815,224
Scholars at public Charge	468,264

A vast multitude of newspapers and journals issue from the American press; their numbers, according to the census of 1840, being:—

Daily Newspapers	158
Weekly Newspapers	1,111
Semi and tri weekly Newspapers	125
Periodical Publications	227

But, with some few exceptions, the newspapers and political journals are more distinguished by the violence of their party-spirit and outrageous abuse, than by ability or information. The best European works are mostly republished in America; and the Americans have themselves made some valuable contributions to the literature they have inherited from their forefathers. Numerous scientific societies are established, and science and the fine arts have made considerable progress in the Union. A vast number of hospitals and charities of all kinds, missions, Sunday-schools, prison societies, savings' banks, and other benevolent institutions, have also been established.

The *Standing Army*, in 1840, amounted to 12,537 men, including 8 regiments of infantry, 4 of artillery, 2 of dragoons, 57 staff officers, and 83 medical officers. The whole territory of the U. States is subdivided into 7 military departments, and 2 grand divisions, the head-quarters of the E. of which are at Elizabeth Town, New Jersey, and of the W. at St. Louis, Missouri; the general head-quarters being at Washington. The pay of a major-general is 200 dollars a month; of a colonel, 75 do.; of a captain, 40 do.; and of lieutenants, from 25 to 30 do., with proportional rations. Sergeants-major receive 17 dollars; corporals, 9 do., and privates, 7 do. a month, without rations. No half-pay is given. The army is not a favourite service, which, considering the demand for labour, and the facilities of rising in all ordinary employments, is not to be wondered at. According to Captain Marratt, the privates in the regular army are mostly Irish immigrants, Germans, and deserters from the English regiments in Canada. (*Diary* see America, II. 303—308.) The native Americans are all, however, enrolled in the militia, which, in 1840, comprised 1,228,592 men.

The *Naval Force* consisted, in 1841, of one ship of 120, 7 of 80, and 3 of 74 guns; 15 first-class, and 2 second-class frigates; 21 sloops of war, 4 brigs, 8 schooners, and some steamers, &c. Marratt says, "It is impossible not to be struck with the beautiful architecture of most of these vessels. The Ohio is, as far as I am a judge, the

perfection of a ship of the line." (*Diary*, III. 8. 10.) The navy is a favourite service; and the pay is much higher proportionally than in the army: captains receive from 2,500 to 4,500 dollars a year; lieutenants, from 1,200 to 1,800 do.; surgeons, from 1,000 to 2,700 do.; assistant-surgeons, from 650 to 1,150 do.; midshipmen, from 400 to 750 do.; masters, from 750 to 1,100 do.; and boat-swains, sail-makers, &c., from 360 to 750 dollars. This scale is much higher than that in the English navy; but, according to Captain Marratt, the officers of the American navy have not one cent more than they absolutely require; all things being much dearer in America than in England to a person not growing or otherwise producing his own necessities, but living upon his income. Besides which, in a country like the U. States, where any one, in a few years, by personal industry, may become independent, it would be impossible for the government to procure officers if they were not tolerably well paid. (*Diary*, III. 15.)

The Americans are justly proud of their navy, and of its gallant exploits during the last war with England. But it should be remembered, that the American ships were mostly of much greater size and weight of metal than the British ships, which they captured; and that, in cases such as the contest between the *Saboteur* and *Chesapeake*, where the ships on both sides were of nearly equal force, the result was different. No doubt, however, the Americans are excellent seamen; and the built, outfit, and discipline of their ships of war do them infinite credit. Seamen for the American navy are not obtained by impressment, but by voluntary enlistment; and, unless we give up the practice of impressment, it is all but certain, in the event of another war occurring, that it will drive vast numbers of British seamen into the American service. This, in fact, it has already done. At the end of last war it was estimated that about 16,000 English seamen were in the American service; so that it may really be said that the victories of the Americans over English ships were in great part achieved by English seamen. It is to be hoped that we may not, by obstinately clinging to a practice fraught with injustice and oppression, so greatly lessen our own and increase the number of foreign seamen.

There are 7 navy-yards in the U. States; those of Portsmouth, in New Hampshire, Charleston, near Boston, New York, Philadelphia, Washington (where all the anchors, cables, blocks, &c. required are made), Portsmouth, in Virginia, and Pensacola, in Florida. These are all small, and very deficient both in wet and dry docks. Properly speaking, the Americans have no great naval *dépôt*, probably in consequence of the jealousy, as to the place of its establishment, which exists among the several maritime states. (*Marriott*.)

*Revenue and Expenditure.*—The revenue of the Union is almost wholly derived from the customs' duties, the produce of the sales of public lands, and the post-office. The customs' duties amount, at an average, to from 16 to 22 million dollars, fluctuating according to the state of trade, the magnitude of the duties, &c. The revenue derived from the sale of public lands fluctuates in a still more extraordinary degree, as is obvious from the following

STATEMENT of the Quantity of Public Land sold in the United States, and the Amount paid for the same during the Eight Years ending the 30th September, 1840.

Years.	Acres.	Price in Dollars.
1833	3,956,297	4,072,285
1834	4,658,419	6,099,281
1835	1,754,429	1,899,801
1836	2,007,182	2,516,233
1837	5,601,103	7,007,593
1838	3,111,907	4,233,265
1839	4,576,383	6,161,257
1840	1,036,617	2,432,202
Totals	56,842,807	72,609,750

We may remark, by the way, that this table sets the influence of the excessive over-issue of bank paper in 1836 in the clearest point of view, as well as the depression under which the Union was labouring in 1840, and which has not yet (1842) been wholly overcome.

The post-office revenue barely suffices to defray the expenses of the establishment, and the other sources of revenue are quite inconsiderable.

The public establishments of the U. States are all on the most parsimonious scale; and her fleet and army, and the defences of her principal cities, are all quite inadequate to repel any hostile attack with which they might be threatened.

The public debt of the Union, which amounted at the close of last war with Great Britain, to 138,713,049 dollars, was entirely paid off in 1835. The surplus revenue which accrued in that and the years immediately following was distributed, pursuant to the act of congress,

among the several states of the Union, on condition that it should be repaid at certain intervals by quarterly instalments. But, owing to the pecuniary difficulties in which they have since been involved, the payment of the last instalment has been indefinitely postponed. Small, indeed, as is the expenditure of the Union, the government has latterly, owing to the embarrassments arising out of the vicious banking system with which the country is afflicted, found the greatest difficulty in meeting its engagements.

Most of the separate states, and some of the principal cities of the Union, have contracted a greater or less amount of debt, principally for the construction of canals, railways, or other local improvements, the erection of public buildings, the establishment of banks, and other institutions, &c. Subjoined is a

Some of the funds so borrowed have been profitably laid out; but the larger proportion have, we believe, been expended on projects, some of which will, most probably, be a total loss, while others will yield little or no revenue for years to come. But their injudicious outlay does not certainly afford so much as the shadow of an excuse for the conduct of Michigan, Mississippi, Louisiana, and other states who have proceeded to repudiate their debts. Nothing, in fact, was ever heard of in the public conduct of nations more entirely profligate and audaciously villanous than this repudiation. Necessity may compel a state, as well as an individual, to become bankrupt; but the repudiating American states have no such excuse; they are all but entirely free from the burden of taxes; and the smallest sacrifice on their part, such as the imposition of a small internal duty on spirits, tobacco, or some such articles, consumed within their limits, would enable them to face all their engagements. The truth is, that their dishonesty is glaring and barefaced, and admits neither of palliation nor excuse. The pretences they have put forward in extenuation of their roguery, serve only to set it in a still more striking point of view. What is it to the capitalists who made them loans, whether they expended them judiciously or employed honest agents? That was their own private affair; and to decline paying their just debts on such flimsy grounds is the climax of knavery. We regret to have to state, that our countrymen are large creditors of the states who have repudiated their debts; and we would fain hope that the experience they have now had of American honour will make them more cautious how they trust to it on future occasions.

At the same time, however, it would be unjust not to state that several of the leading states of the Union have treated the doctrine of repudiation with contempt, and have honourably distinguished themselves by their adherence to their engagements; and, seeing the disgrace that will be brought upon the Union by the proceedings of the repudiating states, the central government may, it is to be hoped, endeavour to bring them to a sense of their duty.

**Religion.**—No particular form of religion is established by law in the U. States. Each sect supports its own ministers, and provides for its own religious instruction. Subjoined is an

**Historical Notice.**—The first English settlement in this part of America was made in Virginia, by a private company, in 1607; and during the civil wars and subsequent period, the pop. of the states was successively augmented by numbers of Puritans from the mother country, who settled in New England, R. Catholics in Maryland, defeated Royalists in Virginia, &c., with numbers of Swedes, Germans and others. The settlement of the several colonies, down to 1776, when the revolutionary war broke out, took place as follows:—

Colonies.	Settled.	Colonies.	Settled.
1 Virginia - - -	1607	8 Providence -	1636
2 New Hampshire -	1623	9 Rhode Island -	1638
3 New Jersey - -	1624	10 North Carolina -	1650
4 Delaware - - -	1627	11 New York (pre- viously Dutch) -	1664
5 Massachusetts -	1628	12 South Carolina -	1670
6 Maryland - - -	1633	13 Pennsylvania -	1682
7 Connecticut -	1635	14 Georgia - - -	1733

The delegates of the above colonies, afterwards called states, signed the memorable Declaration of Independence on the 4th of July, 1776, since which the following states have been added to the Union:—

States.	Add'd.	States.	Add'd.
14 Vermont - - -	1791	21 Illinois - - -	1818
15 Tennessee - -	1796	22 Alabama - - -	1819
16 Kentucky - -	1799	23 Maine - - -	1820
17 Ohio - - - -	1802	24 Missouri - - -	1820
18 Indiana - - -	1816	25 Michigan - - -	1836
19 Mississippi -	1817	26 Arkansas - - -	1836

It would be useless to attempt giving in this place any exposition of the causes which led to the revolutionary war, or any account of its progress. The attempts of the English minister to impose duties on certain articles imported into America, were, as every one knows, the immediate cause of the contest. But though these attempts had not been made, we are not of the number of those who suppose that the struggle could have been much longer delayed. It is idle to suppose that a powerful and rapidly growing country, on the other side of the Atlantic, should have continued to submit to have her governors appointed, and her intercourse with other countries regulated by England. At a certain stage of their progress, all great colonies must separate from their mother country; and the only thing to be regretted in the American revolution is, that it was not allowed to take place without opposition on our part. We derive quite as much advantage from America, now that she is independent, as we should have done had she continued to be a colony; and we do this without being obliged to keep up expensive armaments for her defence and protection.

**ACCOUNT OF THE Churches or Congregations, Ministers, Communicants, &c., belonging to the principal Religious Bodies:—** [See top of next col.]

It will always be one of the chief glories of England, that she was the *magna virum mater*, that she bred and sent forth the men who established this mighty empire in the wilderness. But it would be invidious to attempt to institute any comparison between the English and Americans of the present day. That their characters have diverged considerably is certain. Nor is this to be wondered at, seeing the extremely different circumstances under which the mother people and their descendants have been placed. The merits and the faults of the latter both stand prominently forward; and may be easily and satisfactorily accounted for by those who fairly appreciate the nature of the country they inhabit, and the institutions under which they live.

It may be further observed, that the bankruptcy and mischief occasioned by her worthless banking system, and the disorder it introduces into all the commercial dealings of the country, only affects her prosperity in a very slight degree. The latter is essentially bottomed on agriculture, or rather on the facility with which all classes may acquire tracts of fertile and unoccupied land. The great mass of the American citizens may, like *Antæus*, on the occurrence of any difficulty, fall back upon the land, and gather new vigour from its embrace. The merchants and ship-owners in the great towns, the speculators in banks, railway and canal shares, &c., may be ruined, the local governments may be reduced to a disgraceful state of bankruptcy, and even the federal government be involved in the greatest difficulties, without affecting the elements of the national prosperity, or having any material influence over the condition of the great bulk of the people. In this respect America differs from most other countries; but it is to be observed, that this difference depends wholly on natural circumstances; it is not occasioned by any foresight on the part of the American people, or any peculiar excellence in their government or institutions; but is merely a consequence of the physical circumstances of the country they have the good fortune to inhabit.

Besides those already referred to, we have consulted a great number of works on the subject of this article, among which may be specified that of De Tocqueville, *De la Démocratie en Amérique*, a work that has been praised far beyond its merits; *Lettres sur L'Amérique du Nord*, by Chevalier; *The Introductory Discourse to Wardens, Statistical Account of the U. States, &c. &c.* UNST. (See ORKNEY and SHETLAND ISLES.)

UNTERWALDEN, one of the Four Forest Cantons of Switzerland, near the centre of the confed., in which it holds the 6th rank; between lat.  $46^{\circ} 40'$  and  $47^{\circ} N.$ , and long.  $8^{\circ}$  and  $55' E.$ , having W., Lucerne; N., the same cant., and the Lake of Lucerne; E., Uri; and S. the Bernese Oberland. Area, estimated at 262 sq. m. Pop. in 1837, 22,571, all R. Catholics; and of whom 12,358 belonged to Upper, and 10,203 to Lower, Unterwalden. The territory consists principally of 4 valleys, inclosed by mountains of various heights, the loftiest of which, the Titlis, rises to nearly 11,000 ft. above the sea. Two streams, called Aa, hardly deserving the name of rivers, flow into the Lake of Lucerne; and there are several small lakes, and numerous cascades. The climate is temperate, particularly in the E., where various kinds of fruit are grown. The valleys and lower hills afford fine pasturage; which makes cattle breeding the chief occupation of the inhabs. The cattle are small, but a good cow is estimated to yield a profit of from 50 to 100 florins a year to the owner; and about 10,000 head of cattle are annually depastured in the canton. The cheese of Unterwalden is reckoned inferior only to that of the Emmenthal; and a good deal is sent into Italy. In good years the value of the cheese exported from the valley of Engelberg amounts to about 40,000 florins. Agriculture is comparatively neglected; and corn, to the value of at least 120,000 florins, has to be imported from Lucerne. The vine does not succeed; and the place of wine is supplied by liquors made from different fruits. The forests are a chief source of wealth;

a good deal of timber and fuel being exported. Pine and fir, and after these, beech, oak, and elm, are the principal trees: the extensive forest of Kernvald has formed the line of separation between the republics of Lower or N., and Upper or S., Unterwalden, ever since the 12th century. Mining and manufactures are insignificant; some linen thread is, however, spun in the valley of Engelberg.

In both parts of the canton, the constitution is wholly democratic. Upper Unterwalden consists of 7 communes, all the male inhabs. of which above 20 years of age meet in a general assembly, exercising the sole deliberative and legislative power, on the last Sunday in April at the cap. Sarnen. The executive body, consisting of 14 principal functionaries, chosen by the general assembly, and 65 other mems. appointed by the different parishes, exercises all the high judicial and other functions, except in case of capital punishment; when the *triple council*, an assembly composed partly of special delegates, must pass sentence. Lower Unterwalden consists of 13 communes. Its general assembly is similarly constituted; but its government, carried on at Stanz, the cap., is more complicated than that of the other part of the canton, being conducted by a great variety of councils and assemblies. Public education is every where very backward. Both parts of the canton have but one united voice in the Swiss diet; they contribute 382 men to the Swiss army, and 1,907 fr. a year to the federal treasury.

Unterwalden, with Uri and Schwytz, formed the nucleus of the Swiss Confederation early in the 14th century; but little worth notice has occurred in its subsequent history, except that the inhabs. of Lower Unterwalden made a vigorous opposition to the French revolutionary troops in 1798, for which they suffered proportionally. (*Picot; Statist. de la Suisse; Ebel, &c.*)

UPSAL, or UPSALA, a city of Sweden, cap. prov. of same name, on the Sala, by which it is divided into two parts, 37 m. N. by W. Stockholm. Pop., 4,500. "Upsala, built on a gentle height, and part of the adjoining plain in a very level and fertile country, is one of the most beautiful old-fashioned cities in Europe. The view on approaching it is very fine, an old red palace on the hill, occupied by the governor of the prov., with the newly-finished university-buildings glistening white beside, and the grey towers of the cathedral rising calmly over both, give an air of grandeur to the place, as seen by the distant spectator, beyond that of any town we had yet visited in Sweden. If, on entering, this city loses somewhat of its dignity, still its broad, quiet streets, and its strange old houses, generally of brick covered with stucco, or of wood painted red and roofed with turf, impressed us at once as in excellent keeping with the character of this favoured retreat of science." (*Bremner, li. 299.*)

Only a few of the inhabs. are engaged in manufactures, or in the little trade carried on by the river, on which a steam navigation is kept up with Stockholm. The greater number depend for support on the University, the principal in the kingdom. This establishment was founded by Steno Sture in 1478, and modelled on the university of Paris. It was warmly patronised by Gustavus Vasa, who was partly educated in it. At a subsequent period, however, it was transferred to Stockholm, but was again restored to Upsal by Charles IX. It has long enjoyed a very extensive celebrity, and is at present attended by from 1350 to 1450 pupils, though of these only in the winter session of 1837, the University had in all 1,376 students, of whom 874 were resident. Of the entire number, 269 attended the theological, 305 the legal, 142 the medical, and 408 the philosophical classes. The students, like those of Scotland and Germany, lodge in the town. Their average expenditure may be estimated at about 30*l.* for the session. As many as 150 students are maintained free of expense from endowments left by Gustavus Adolphus. The public lectures are all gratuitous, and but few private lectures are attended. The lectures commence in October, and continue till Christmas, when there is a 6 weeks' vacation, after which they are resumed, and continue till May. No fixed number of years' study is prescribed for a degree, the rule being, that a candidate may obtain it as soon as he can pass the required trials, which few attempt till they have studied in the university for some years. The public examinations are not very formidable; but those which have first to be gone through privately with each professor, are conducted with great strictness. Printed lists of the students and professors are published every year: the former are divided into 8 nations, named from different librarians, provs., each of which has an inspector, curator, 4 theol. &c. In the lists for a recent year, there appear a theological, 3 judicial, 5 medical, and 14 philosophical professors, in all 26; besides 19 adjuncts, and 24 docents, with a music director, and masters for German, French, English, dancing, fencing, riding &c. Most of the professors lecture in their own houses. None have a salary of more

than 300l. a year, and many have much less. The University revenues amount to about 130,000 thalers banco a year. A professor who has continued in office for the space of 30 years, is allowed to retire, with the title of *Emeritus*, and enjoys his salary during life. The new university is a handsome and spacious edifice, built of freestone, in the Florentine style of architecture. Most part of it has been devoted to two splendid halls, one on the first story for the principal library, and another on the second for oratorios, the conferring of academic degrees, &c. The ground floor is occupied by rooms appropriated to MSS.; but, until very lately, the library, comprising 100,000 volumes, remained in the old university building. The greatest curiosity in this collection, is a manuscript of the four gospels, called, from its silver letters, the *Codex Argenteus*, supposed to be a copy of the Gothic translation made by Ulphilas, the apostle of the Goths, in the 4th century. Much controversy has existed among the learned as to the characters in which this famous codex is written; especially whether it be in those used by the Goths of Mesia, ancestors of the present Swedes, or in the Frankish idiom. At all events, however, there can be no doubt of its high antiquity; it is admitted on all hands not to be later than the 6th century, and may be of the 4th or 5th, while it certainly has the further advantage of having been translated from the original Greek. The codex was found in 1597, in the library of the Benedictine abbey of Werden, in Westphalia; and having found its way (whether honestly is doubtful) into the library of Isaac Vossius, was, on his death, purchased for the comparatively trifling sum of 250l. by the Count de la Gardie, who presented it to the university. (*Coxe*, iv. 173, &c. 8vo. ed.)

In the same edifice are preserved a beautiful cabinet, presented to Gustavus Adolphus by the city of Augsburg in 1632, and the large chest, sealed and left by Gustavus III., with instructions that it should not be opened till 50 years from the day of his death. The prescribed period expired during the past April (1842); but we have not learnt whether the chest has been opened. Here, also, is a botanic garden, and a museum, in which is a fine statue of Linnaeus by Byström. This university has had many celebrated individuals among its professors, especially in the department of Natural History; among others may be specified, Linnaeus, Bergman, Arzelius, &c.

The cathedral is an imposing edifice, though built only of brick; in some respects its appearance is similar to that of Notre-Dame at Paris. It is 350 feet in extreme length, with a lofty nave and a magnificent altar. The Swedish monarchs were formerly crowned in this cathedral, and here, also, they are mostly interred. Among the numerous tombs, the most interesting is that of Gustavus Vasa; distinguished in every station of life, and equally great as a legislator, a warrior, and a politician. Linnaeus, also, is entombed in this cathedral, and the house is still shown which he occupied in the town.

Except the cathedral and university buildings, Upsal has no other remarkable edifice; but it has some public walks, on one of which a fine obelisk has been erected to the memory of Gustavus Adolphus. It is the metropolis of Sweden, and possesses an ecclesiastical school, a cosmographic, and other scientific societies.

About 2m. N. is Old Upsal, a mere village of huts round an old church, the origin of which is lost in remote antiquity, but which certainly was once dedicated to the worship of Odin. Near it are some remarkable tumuli, and many curious antiquities have been discovered in the neighbourhood. (*Coxe*, iv. 1. *Bremner's Excursions*, ii. 1. *Dict. Géog.*; *Voyage de deux Français*, &c.)

**UPTON ON SEVERN**, a market-town and par. of England. co. Worcester, hund. Pershore, on the Severn, here crossed by a stone bridge of 6 arches, 9 m. S. Worcester. Area of par., 3,110 acres. Pop. of do., in 1831, 2,343. The town is neatly built with well-paved streets. The church, rebuilt in 1758, is a handsome structure. The living, a valuable rectory, worth 979l. a year, is in the patronage of the Bishop of Worcester. The Baptists, and other sects, have also places of worship. A charity school for 16 girls, founded and endowed in 1718, to which a boys' school was attached in 1797, has been incorporated with 2 national schools, supported by voluntary contribution. A subscription library has been founded. The river, which is navigable thus far for vessels of 100 tons, has a commodious wharf, and a good harbour for barges. It has no manufacture of any importance; but a considerable trade is carried on in corn, malt, &c. and a good deal of cyder is brought here for shipment from Hereford and other parts. A manor court is held occasionally, and petty sessions once a fortnight. Upton is a place of great antiquity. During the civil wars, it adhered stoutly to the royal cause. Market-day, Thursday; fairs, four times a year.

**URBINO** (an. *Urbium Horicense*), a fortified town of Central Italy, in the Papal States, cap. leg., and formerly of the duchy of its own name, on a mountain near the Metauro, 20 m. S.W. Pesaro. Pop. of the town only

about 7,000, but, including the suburbs, 12,000. (*Rampoldi*.) Its fortifications are a good specimen of the military works of the 14th century. Its old castle now forms part of a Carmelite convent, in which and in the churches are several fine works by Raphael and other distinguished artists. Urbino has an ancient ducal palace, which, like the *Palazzo Albani*, is a large and fine building; a newly built cathedral, with a rich chapter and archbishopric; a university, with about 200 students; a college, hospital, seminary, an association called by the singular title of *Accademia Assurditorium*, and a court of primary jurisdiction. But the legate and other chief authorities of the legs. of Urbino and Pesaro reside at the latter town. Urbino is celebrated for its brass, manufactured to the value of about 14,000 crowns a year. (*Bowring's Rep.*) It has 4 annual fairs, and markets on Wednesday and Saturday.

Among other illustrious individuals, Urbino has to boast of having given birth to Raphael, hence called by the Italians *Raffaello d'Urbino*, unquestionably the greatest painter of modern times. He was born on Good Friday, 1483, and died at Rome in 1520, on the anniversary of his birth, at the early age of 37—a wonderfully brief space in which to have attained to such matchless proficiency, and to have completed so many great works. This was also the birthplace of Bramante, one of the greatest modern architects, a relative of Raphael; of the machinist Zabaglia, and other distinguished personages. (*Rampoldi*; *Corder's Italy*, &c.)

URI, a canton of Switzerland, in the S.E. part of the Confederation, between the 46th and 47th degs. of N. lat., and 8° 30' and 9° E. long., having N. Schwyz, the Lake of Lucerne, E. Glarus and the Grisons, S. Tessin, and W. the Valais, the Bernese Oberland, and Unterwalden. Area estimated at 338 sq. m. Pop. in 1837, 40,650, all Rom. Caths. The canton consists mostly of one principal valley, that of the Reuss, into which several others open laterally; and the whole are shut in, except at the N. and S. extremities of the canton, by lofty and generally impassable mountains. Among the mountains comprised in this canton is the celebrated St. Gothard, the passage across which is the principal route from Italy into E. Switzerland. The transit trade by this road was, and perhaps still is, the most profitable occupation of the inhabs. of Uri. Various other lofty and remarkable summits are included in the ranges surrounding the canton. The principal river is the Reuss, which rises in Mount St. Gothard, and after a course usually N., through Uri, in its whole length, falls into the Lake of Lucerne, near Altorf. "It is," says Luglis, "a remarkable river, not for the length of its course, or the volume of its waters, but for its extraordinary rapidity, far exceeding that of the Rhine; and the magnificent scenery on its banks. Its whole course is a succession of cataracts; and in the short space of 4 leagues, its inclination is no less than 2,500 ft." (*Ingli's Switzerland*, p. 100.) Besides the Lake of Uri (the S. extremity of that of Lucerne) there are numerous small alpine lakes; and the canton is a good deal visited by strangers, both on account of its sublime scenery and the historical interest attached to it as the land of Tell, said to have been a native of Bürglen, near Altorf.

The pastures of this canton are very superior, and these and their cattle constitute the entire wealth of the inhabs. A good many cattle, tended by Bergamesque cowherds, are sent thither from Italy to feed during summer. The cheese of the canton is in high repute; but it is not extensively produced; and the stock of sheep, goats, &c., is not more than sufficient for the wants of the pop. Agriculture is entirely neglected. "Throughout the whole of the upper part of the valley of the Reuss and in the vale of Usern, not one stalk of any kind of grain, nor one cultivated vegetable of any kind, is to be seen. There is no doubt, however, that these might be successfully cultivated. The vale of Usern is better sheltered than almost any part of the Engadine, and is less elevated than many other parts where rye is grown abundantly, where other grain, even wheat, is not a failure, and where all the hardier vegetables are plentiful. About 2 leagues lower down than Adernat, the valley widens. Cottages are sprinkled here and there, and now and then a hamlet; still, however, grass only was to be seen. I saw many warm stripes, and even little plains, along the river side, where wheat and vegetables could have been successfully cultivated; but I still continued to meet carts laden with flour and potatoes. As I descended still lower in the valley, the scenery became more varied and more beautiful. Charming meadows lay by the river side, prettily diversified by clumps of walnut and pear trees; and cottages and hamlets thickly dotted the slopes. Altorf is surrounded by gardens and orchards; yet even here, where the climate is mild, and where the ordinary fruits come to great perfection, scarcely an ear of corn is to be seen." (*Ingli's*, p. 1045.) This, however, does not originate in any want of industry, but in what is most probably a well-founded conviction on the part of the inhabs., that it is most advantageous for

them to confine their attention to the breeding and depasturing of cattle, and to import their corn, flour, and other provisions, and such manufactured goods as they do not produce in their cottages. The devastations of the late war, and the construction by Napoleon of the route over the Simplon, by diverting a considerable portion of the travelling and transit trade carried on through this canton into a new channel, have been especially hostile to its interests. Several metallic ores are met with, and Pictot (p. 237.) enumerates a long list of valuable minerals found on Mount St. Gothard; but mining industry is quite insignificant.

Uri is subdivided into two districts, Uri and Ursern: Altort is the cap. The constitution is strictly democratic. The legislative power resides in the General Assembly, composed of all the male pop. above 20 years of age, which assembles every year on the first Sunday in May, to choose the cantonal council of 44 mems., to which is confided the direct executive power. There are several inferior councils for separate departments of service. Each district has its own assembly and tribunals; and in the cap. is a tribunal of appeal, composed of 15 mems., and presided over by the *landamman*. The communes are generally too poor to support public schools all the year round, and education is very backward; no libraries or literary societies worthy of notice exist in the canton. The inhabs. are under the ecclesiastical jurisdiction of the Bishop of Chur: they are mostly of the German stock, though in the S. an Italian dialect is spoken. Contingent to the Swiss army, 236 men; do. of money to the federal treasury, 1,184 fr. a year. This canton is supposed to have derived its name from the *urus*, or wild bull, which formerly inhabited its valleys in great numbers. Uri was one of the three cantons which revolted from the German empire in 1307, and formed the nucleus of the Swiss Confed. It was a principal theatre of war between the French and Austrians, in 1799–1800. (*Pictot, Statist. de la Suisse*, &c.)

URUGUAY, or BANDA ORIENTAL, a republic of South America, between lat. 30° and 35° S. and long. 52° and 59° W.; having N. Brazil, E. and S. the Atlantic Ocean and the estuary of the La Plata, and W. the Uruguay river (see *ante*, p. 517.), by which it is separated from the Argentine or La Plata territories. It is of nearly circular form, and is supposed to embrace an area of above 200,000 sq. m., while its pop. is not supposed. Indians included, to exceed 150,000, or at most 200,000. It is but very little known. The coast presents the aspect of a low flat plain, without wood of any kind, and as far as the eye can reach quite level in appearance with the water. Inland, however, and particularly in the N., the country is intersected by many hill-ranges alternating with valleys traversed by considerable affluents of the Uruguay. In this territory, the humidity of the soil, which is watered by numerous rivers, is corrected by the Pampero, a remarkably dry wind. The climate of Uruguay is proverbially healthy, and it is evident that the thinness of the pop. must arise from the mode of life followed by the settlers, or from political causes, and not from any deficient fertility of the soil, or other natural or necessary cause. It is divided into 9 depts., and possesses 3 principal towns, Monte Video, La Colonia, and Maldonado, 15 small towns, and 8 hamlets, without including estancias or farms, and ranchos or cottages. Monte Video, having a better port and as good a government, bids fair to become a city of greater trade and wealth than its opposite rival, Buenos Ayres. (For its trade and that of the republic generally, see the art. MONTE VIDEO.) Uruguay is an integral, not a federal, republic: it formed a prov., under the gov. of Buenos Ayres, till 1821, when it was taken by the Brazilians, and incorporated with Brazil under the title of Prov. Cisplatina. In 1825, however, it declared itself independent; and its independence was recognised in 1828 by a treaty between Brazil and La Plata. (See Mr. Scarlett's *S. America*, 52–56.)

URUMEA, OORBAH, or SHABEE, a town, and a considerable lake of Persia, prov. Azerbijan. The town stands in a fine plain, watered by the Shar, 8 m. W. the lake, and 65 gn. S.W. Tabriz. Its pop. has been roughly estimated at 12,000. It is fortified with a strong wall and deep ditch, which may be filled with water from the river. Though supposed to be the *Thebarma* of Strabo, it is said to possess no remains of antiquity worth notice: it has, however, been rarely, if at all, visited by recent European travellers.

The lake of Urumea or Shabee was visited by Major Rawlinson so late as 1838. "It extends above a degree of lat. in length, and is about 1-2d of that distance in extreme breadth. The greatest depth of water that is found in any part is four fathoms, the average is about two fathoms, but the shores shelve so gradually that this depth is rarely attained within 2 m. of the land. The specific gravity of the water, from the quantity of salt which it retains in solution, is so great, that a vessel of 100 tons' burden has a draught of no more than 2 or 4 feet. This heaviness of the water prevents the lake from being much affected by storms, which, from its extreme shall-

lowness, would otherwise render its navigation dangerous. A gale of wind raises the waves but a few feet, and as soon as the storm has passed, they subside. It is an old opinion that the waters of this lake are too salt to support animal life. No fish, certainly, are found in it, but the smaller class of zoophytes are met with in considerable numbers. The islands in the lake, until lately, were barren and uninhabited; but the largest has been recently colonized, and settlements on the rest have been proposed." (*Geog. Journ.* x. 7. &c.)

On the E. side of the lake is the village of Shishewan, the residence of a Persian prince, Melik Kasim Mirza, a brother of the late shah, who has adopted in every particular European habits and pursuits. He has built a palace in the European style, near which he has established mulberry gardens for the culture of silk, a farm yard, a glass work, a pottery, looms for weaving cotton, silk, and worsted goods, and various other kinds of manufactures. He has also built a vessel of 100 tons, which he employs in trading on the lake; on which also, he contemplated the introduction of steam navigation. (For further particulars, see Rawlinson in *Geog. Journ.* x. 5–9, &c.)

USHANT (Fr. *Ouessant*), the most W. of the islands off the coast of France, forming a portion of a group near the W. coast of Brittany, dep. Finistère, in lat. 48° 28' N., long. 5° 3' W., 26 m. W.N.W. Brest. Its area is about 2 sq. leagues, and its pop. rather exceeds 2,000. It is difficult of access, but is tolerably fertile, affording pasture to a good many sheep and horses. It has a village, several hamlets, an old castle, and a small harbour frequented by fishing boats. Sir Edward Hawke totally defeated a French fleet, under Admiral Conflans, off the coast of this island, in 1759. Owing to the violence of the weather, two of the British ships accidentally got ashore, and were lost. At a later period, on the 27th July, 1778, an indecisive action took place off the island between the English fleet under Admiral Keppel, who had been second in command in the former action, and that of the French under Count d'Orville.

USK, a pari, and mun. bor., market-town, and par. of England, hund. Usk, co. Monmouth, on the Usk; here crossed by a stone bridge of 5 arches, nearly in the centre of the island, 12 m. S.W. Monmouth. The modern bor., which is more extensive than the ancient, has an area of 410 acres, with a pop., in 1831, of 1,160. The town is neatly, but irregularly built, the houses being mostly detached and interspersed with gardens and orchards. It is indifferently paved; and down to a recent period was not lighted. The church, which belonged to an ancient priory, appears to have been erected in the Norman period. It was originally cruciform, but has been very much altered; the square embattled tower now at its E. end, seems to have been formerly in its centre; its interior contains little worth notice, except an inscription on a brass plate, which has not yet been satisfactorily explained. The living, a vicarage, worth 250*l.* a year, is in the gift of Mr. Williams, Esq. Here, also, are chapels for Independents, Wesleyans, and R. Catholics. Over the market-place is the town-hall, a handsome building, erected at the expense of the late Duke of Beaufort, attached to which is a lock-up house for the custody of prisoners till they can be conveyed to the co. gaol. The educational establishments comprise a free grammar-school, founded and endowed in 1624, to which a writing school has since been attached; a national school for both sexes, supported by voluntary contributions; and almshouses for 24 inmates. Near to the latter are the remains of the ancient priory previously alluded to.

"Usk is increasing not only from natural increase of pop., but also from the beauty of its situation, attracting persons of independent property to build cottage villas in its vicinity. It has a small manufacture of Pont-y-pool japan ware, which employs 4 or 5 hands, and is the only one remaining in this part of the country, the trade having been removed to Birmingham. It has no other trade peculiar to it, and very little of any kind." (*Parl. Bound. Report*.) Most part of the inhabs. are engaged in husbandry and salmon-fishing. The earliest charter of the bor. dates from 1399; but it has not been governed for a long period by this or any other charter. The local authority is vested in a portreeve, chosen annually; a recorder, 2 bailiffs, 4 constables, and an indefinite number of burgesses. It is associated with Newport and Totmouth, in returning 1 mem. to the H. of C. Quarter electors for the three bors., in 1820–40, 1,304. Quarter sessions for the co. are held here, as well as a court for the recovery of small debts, and a court leet twice a year.

Usk is a place of remote antiquity, and appears to have formerly been of much more importance than at present. On an eminence adjoining the town are the extensive remains of its ancient castle, formerly one of the most considerable structures of its kind in the country. It came through the Mortimers, earls of March, into the possession of the crown, and was the favourite residence of Richard duke of York, nephew of Henry VI., whose

sons, Edward IV. and Richard III., were born within its walls. At a subsequent period it belonged to the Earls of Pembroke; and is now the property of the Duke of Beaufort.

Market-day, Thursday; fairs, four times a year, for wool, horses, cattle, and pedlary; and once a month for cattle only. (*Beauties of England and Wales; Parl. and Man. Board, 1845.*)

USKUP or SCOPJA (an. *Scopi*), a considerable town of European Turkey, prov. Macedonia, cap. Sandjick, on the river of its own name, a tributary of the Vardar, 110 m. N.W. Salonica. Its pop. is estimated at about 10,000. It has a good many handsome mosques, Greek churches, &c.; but its streets, though wide, are filthy in the extreme. It is the see of a Greek archbishop, and has some manufactures of leather. A Turkish garrison is stationed in its old dilapidated castle.

USTIUG (VELIKI, or 'the Great'), a town of Russia, gov. Vologda, at the confluence of the Joug and Souchonia, tributaries of the Dwina, about 400 m. from the White Sea, and 550 m. E. by N. Petersburg. This town, though in so remote and desolate a region, has 8,000 inhab., and is the seat of a considerable trade between Europe and Asia. It has, according to Possart, 3 cathedrals and 28 par. churches, many of which are built of stone; and several private buildings, and a large exchange, are of the same material. It has numerous tallow, soap, candle, leather, and tile factories, with saw-mills, and some jewellery and silver works; but its trade is chiefly in corn, lard, linen, ship timber, and sail cloth. Its merchants, who trade with the Siberian towns generally, as far as Kiachta, were estimated, in 1830, to possess an aggregate capital of 288,000 roubles; and the town revenues are estimated at 20,000 do. a year. A large annual fair is held here on the 8th July. (*Possart, Kuisher; Russland.*)

UTICA, a town or city of the U. States, nearly in the centre of the state of New York, on sloping ground, gently rising from the Mohawk river, and on the line of the Erie canal, 82 m. N.W. Albany, and 180 m. N. by W. New York. Pop., in 1840, 12,872. It is regularly laid out; the streets, which generally cross each other at right angles, are, in some instances, shaded by rows of trees; and the houses are, for the most part, handsome and substantially built. The Erie Canal, which intersects the town, is crossed within its limits by several bridges, and here unites with the Chenango canal, which opens a communication with the Susquehanna. Utica has above a dozen churches for different religious bodies, some of which are large and costly edifices. It has also a lyceum, and various superior public and private academies; a mechanics' association for the promotion of manufactures, &c.; a young man's association, with a library and reading-room open to the public; an apprentices' library, a theatre, and numerous religious and charitable institutions. Its situation, at the junction of the Erie and Chenango canals, has made Utica the seat of an extensive and rapidly increasing commerce; and it has numerous banks, insurance companies, and other joint-stock associations. Its manufactures are also extensive and various; and it is in the centre of a district which is well supplied with water-power, and in which there are manufactures, with power-looms, for the weaving of cotton and other cloths, the spinning of cotton yarn, &c.; with saw-mills, grist and flour-mills, &c. In 1835, six weekly and two monthly periodical publications were issued in the town. It also derives considerable advantage from its being at the W. terminus of the Utica and Schenectady railroad, 77 m. in length, opened in 1830, and from another railroad, 53 m. in length, by which it is connected with Syracuse. In 1794, Utica was an inconsiderable village; and so late as 1820, its pop. amounted to only 2,972; but the Erie canal having been opened, in 1823, its subsequent increase has been astonishingly great. It was incorporated as a town in 1817, and as a city in 1832; and it is worthy of remark, that in the charter by which it is erected into a city, the licensing of shops and houses for the retailing of ardent spirits is expressly prohibited! We are unable, however, to say whether this prohibition has been practically carried into effect. In the list of businesses in the town, in 1835, we observe 21 *br.* (*Encyc. Americana; New York Gazetteer; American Almanac, 1841-42, &c.*)

UTRECHT (an. *Utra-Tractum*), a city of Holland, cap. prov. of its own name, on the Old Rhine, by which it is divided into two parts, 20 m. S. by E. Amsterdam. Pop. 44,000. It is oval-shaped, and is one of the best situated towns in the kingdom, being built on an undulating tract of land, more elevated than the surrounding territory, and having, in consequence, a drier and purer atmosphere. The country immediately around is finely wooded, and well sprinkled with farm-houses and cottages. Fields of wheat and other grain are seen instead of unvarying green pastures; and the novel spectacle presents itself of rivers and canals flowing below the general level of the country, and not above it on the tops of mounds, as elsewhere in Holland. The approach to

Utrecht, from Amsterdam, is very fine, being through a long avenue of lime trees, which forms a favourite public walk. The city was formerly defended by lofty brick walls; but these are now broken and dismantled, and the old ramparts have been converted into *boulevards*. Since the separation of Holland and Belgium, however, some outworks have been thrown up.

Utrecht has an antique appearance, many of the houses being built in the Gothic style; as in other Dutch towns, the material for building is mostly brick. Mr. Jacob says, "The streets are more regular, the houses more modernised, and the squares more spacious than in other towns of Holland. In some of the streets there are canals, or rather branches of the Rhine, for though they soon terminate in stagnant canals, they have here some motion. The water is so far below the level of the thoroughfares, that the wharfs on its sides have doors opening to a kind of caverns under the streets, in which many of the poorer classes find habitations." (*Tour in Germany, &c. p. 45.*)

The fine public walk called the Mall, on the E. side of the town, about 2,000 yards in length, is divided into alleys by rows of lindens. The cathedral, formerly a fine edifice, has been so much dilapidated that only the choir, transept, and tower remain; the last is wholly detached from the other part, leaving room for a wide street on the place formerly occupied by the nave. It must have been originally larger than York Minster, but less elegant, being mostly constructed of brick. The transepts are shut up, and the only portion at present in use is the choir, fitted up in a plain manner for the Presbyterian service, though it has some fine monuments. The tower is a huge square structure, 388 ft. in height; and from its summit the view extends over a wide extent of country, comprising many cities, towns, and villages.

Utrecht has a celebrated university, founded in 1676 at the expense of the city, which ranks next to that of Leyden; it has 5 faculties and 19 professors, and is attended by about 600 students. The university buildings have no outward show, but they comprise a valuable library, a pretty good museum of natural history, and extensive collections in anatomy, pathology, &c.; especially one of beautifully-executed models in coloured wax. This city has also acquired distinction from the number and excellence of its superior schools. It has a museum of national agricultural implements, established in a fine building, once the residence of Louis Bonaparte, but this, according to Mr. Chambers, is an inferior collection. It has also a tribunal of commerce, an academy, founded in 1778, which gives prizes for the best memoirs on scientific subjects, a branch of the Society of Public Good, a mint, the machinery of which is partly wrought by air-pressure, &c.

Utrecht, being in the centre of a populous agricultural district, is more bustling than the small Dutch cities in general. It has considerable manufactures of cloth and other woollen stuffs, velvets, linen fabrics, silk twist, fowling-pieces, pins, &c., with bleaching-grounds, sugar and salt refineries, brick and tile works, &c. It sends 6 deputies to the provincial states. The famous act, called the Union of Utrecht, declaring the independence of the seven United Provinces, was signed here on the 29th of Jan. 1579; and the treaty of Utrecht, which terminated the war of the Spanish Succession and gave peace to Europe, were concluded here, in 1713 and 1714. Among other distinguished individuals, Pope Adrian VI., the preceptor of Charles V., was a native of this city. (*Schreiber, Guide du Rhin; Chambers' Tour in Holland; Diet. Grog., &c.*)

UTRERA (an. *Utrige Vericulum*), a town of Spain, in Andalusia, prov. Seville, cap. distr. on the road from Madrid to Cadiz, 14 m. S.E. Seville. Pop., according to Miñano, 11,050, but, according to Capt. Scott, 15,000, mostly agriculturists. "Utrera stands in the midst of a vast plain, that may be considered the first step from the marshes of the Guadalquivir towards the Ronda Mountains, 12 m. distant to the E. A slight mound, that rises in the centre of the town, and is embraced by an extensive circuit of dilapidated walls, doubtless offered the inducement to build a town here; and these walls, some parts of which are very lofty, and in a tolerably perfect state, appear to be Roman, though the castle and its immediate outworks are Moorish. The town is large, and not walled in; the streets are wide and clean, and a plentiful stream, remarkable as being the only running water within several miles, rises near, and traverses, the place." (*Scott's Ronda and Granada, li. 141, 142.*)

It has a spacious square, 2 par. churches (one of singular architecture), various convents and hospitals, a good town-hall, prison, cavalry barracks, &c.; and near it is a convent, resorted to by a great concourse of devotees during a festival which lasts eight days from the 8th of September. The bulls bred in the vicinity are the most ferocious of any in Andalusia; and a considerable trade is carried on here in cattle and horses; it has, also, some manufactures of hats, soap, starch, wax, and leather. In

its vicinity are some productive salt springs. Utrera is an important military post, being at the divergence of several cross-roads. The French, when advancing upon Cadiz in 1810, made strenuous efforts to reach it before the Spanish troops under the Duke of Albuquerque; but, being anticipated by the latter, Cadiz was prevented from falling into their hands. (*Scott's Ronda, &c., ii.; Miliario.*)

**UTTOXETER**, a market town and par. of England, co. Stafford, hund. Totmonslow, near the Dove, which is here crossed by a fine stone bridge of six arches, connecting the cos. of Stafford and Derby. Area of par. 8,291 acres. Pop. of do. in 1831, 4,864. The town, 17 m. W. by S. Deri, stands on a hill sloping towards the river, and consists principally of three streets, diverging from the market-place in its centre. With the exception of the tower and lofty spire, which are ancient, the church has been recently rebuilt: the living, a rectory, worth 136*l.* a year, is in the gift of the dean and canons of Windsor. Here, also, are several dissenting chapels. It has a free school for 14 boys, founded in 1588 by Mr. Thomas Allen, a native of the town, celebrated by Sel-den, Camden, and others for the extent of his mathematical and antiquarian learning; a national school supported by subscription; almshouses for 12 inmates; a fund for the apprenticeship of poor children, &c. Petty sessions are held weekly by the co. magistrates. The hardware manufacture is carried on to some extent, and there are numerous iron forges in the vicinity. Owing to the fertility of the surrounding country, especially the excellence of the pastures along the Dove, the market held here for agricultural produce, cattle, sheep, &c., is one of the best in the county. Its trade is facilitated by the Caldon canal, which joins the Trent and Mersey canal, coming within a short distance of the town. Market day, Wed. Fairs 10 times a year, chiefly for cattle, horses, and sheep.

**UXBRIDGE**, a market town and chapelry of England, par. of Hillingdon, co. Middlesex, hund. Elthorne, border of Buckinghamshire, on the Colne and Grand Junction canal, over each of which it has a bridge, and on the high road from London to Oxford, 15 m. N. by W. the former. Pop. in 1831, 3,043. It is situated on a slight eminence sloping to the river, and consists mostly of one long street, with a smaller one on the road branching off to Windsor. The main street is paved and lighted with gas; and many of the modern houses are handsome and substantially built. The market-house, erected in 1749, is a brick building 140 feet in length by 49 in width, supported on about 50 wooden columns. St. Margaret's chapel, built in 1447, is an irregular edifice of flint and brick in the Pointed style, with a low square tower: the living, a perpet. curacy, worth 111*l.* a year, is in private patronage. The Baptists, Friends, Independents, and Methodists have each places of worship. Two free schools, on the Lancasterian system, are held over the market-place, and are supported partly by voluntary contributions, and partly by annual subscription from the manor, funds, market-tolls, &c. A school of industry was founded in 1805, and there are several other charitable institutions for education and the relief of the poor. A reading room and public library has been established.

Uxbridge has the largest country corn-markets in the kingdom. A great deal of excellent flour is made at the flour-mills in the town and its immediate vicinity, and its millers and mealmen are in general as opulent as they are respectable. Large quantities of malt are, also, produced in the town, the trade of which is greatly facilitated by the Grand Junction canal. It has also an extensive manufactory of implements of husbandry, garden-chairs, &c.; and a brick-field to the S.E. of the town furnishes employment for numerous hands. The municipal government is vested in the hands of 2 constables, 4 headboroughs, and other officers elected annually. Petty sessions for the town and several adjoining par. are held every fortnight, and a court of requests for debts under 4*0s.* once a month. The unsuccessful negotiation between Charles I. and the parliament in 1644 took place in an old brick building called the "Treaty House," which has lately been converted into an inn. Markets, Thursday and Saturday; fairs, 4 times a year. (*Beauties of England and Wales; Priv. Inf.*)

**UZÈS**, a town of France, dep. Gard, cap. arrond., on the Auzon, 12 m. N. by E. Nîmes. Pop. in 1836, ex. comm., 5,946. It is built on the declivity of a hill, at the foot of which rises the stream which was anciently conducted to Nîmes by the *Pont du Gard*. It is old, ill built, and ill laid out. It was a bishopric in the time of the Visigoths, and the old episcopal palace, and the former residence of the dukes of Uzès, are the principal edifices: the last is a huge castle, inclosed by high walls flanked with round towers, and bearing a good deal of resemblance to the Bastille in Paris, destroyed in 1790. Uzès suffered much in the religious wars, when its bishop, chapter, and most part of its inhabs., embraced Protestantism, and destroyed their cathedral. It has a court of

primary jurisdiction, communal college, &c., and manufactures of silk hosiery, coarse woollens, pasteboard, &c. (*Hugo. Art. Gard; Guide du Voyageur en France.*)

## V.

**VAL-DE-PENAS**, a town of Spain, in New Castile, prov. La Mancha, part. Ciudad-Real, in a tolerably fertile plain, 112 m. S. by E. Madrid. Pop., according to Miliario, 10,248. It is well built; the mansion of the Marquis of Santa Cruz, and the warehouse of the royal offices, being conspicuous among many other good edifices. This town would appear to be less overstocked with religious edifices than most others in Spain, for it is said to have only one par. church and one convent. It is, however, best known by the dry red wine produced in its neighbourhood, and hence called Val-de-Penas, which is in much request in Madrid, and approaches in quality to some of the stronger Bordeaux wines. The bread here is also of peculiar excellence. Some flucens and soap are also manufactured, and woollen stuffs are sent to the town to be dyed. It has a large fair on the 7th of Aug. (*Miliario.*)

**VALAIS** (Germ. *Wallis*), a canton of Switzerland, in the S.E. part of the Confed., between lat. 45° 50' and 46° 40' N., and long. 7° and 8° 25' E., having N. the Bernese Oberland, N.E. Uri and Tessin, E. and S. Piedmont, and W. Savoy and the canton of Vaud. Area estimated at 1,660 sq. m. Pop., in 1837, 75,798, all Roman Catholics. This canton consists of the valley of the Upper Rhone, and may be described as "an immense trough," 70 m. in length, 1½ m. in depth, and 2 m. wide at the bottom. The mountains on each side are the highest in Europe; they form two walls of rock, rising from 10,000 to 14,000 ft. above the Rhone: this valley may therefore be considered as the deepest in the known world. On the N. side are the Alps, to which belong the Finsteraarhorn, Jungfrau, Breithorn, and other enormous peaks; while the S. boundary is formed by the great chain from Mount Blanc to St. Gothard, including the Cervin and M. Rosa. At the upper end of the valley these two ranges unite. Sixteen lateral valleys, some of considerable extent, open into the main valley of the Rhone; and where they join it, the width of the flat part of the valley is increased. Thirteen of these lateral valleys are inhabited. That part of the valley below Sion, formerly distinguished as the *Bas-Valais*, is a flat plain, swampy, and unhealthy, where the heat of summer is intense, and millions of mosquitoes, with intermittent fevers, cutaneous diseases, and erythema in its worst forms, abound. Above Sion, in the *Haut-Valais*, the marshes disappear, and fine pasturage and vineyards indicate a more favoured region." (*Condor's Italy, &c. i. 280.*) The Valais is remarkable as presenting within its limits the greatest known area all the different climates and kinds of vegetable products met with between Italy and Iceland. At the foot of the Bernese Alps the vine succeeds remarkably well, and very good wine is produced, though in its management the inhabs. be both unskillful and slovenly. Indian figs, almonds, chestnuts, pomegranates, grow with little or no culture along the banks of the Rhone, and corn of all kinds is produced at different elevations. The cattle of the Valais are inferior to those of most of the other Swiss cantons; but the rearing of stock is the principal branch of rural industry; the surplus produce in cattle, cheese, &c. being exported chiefly across the Simplon into Lombardy. The pop. is much poorer than that of the Bernese Oberland; which Mr. Bakewell attributes, though, perhaps, with less justice than he supposes, to two causes: first, that the land belongs to a few great proprietors, and the peasantry, being merely tenants, feel but little interest in its improvement; and next, the prevalence of the Rom. Cath. religion, with which there is usually found combined, in Switzerland at least, much ignorance and indolence. Iron, copper, lead, silver, cobalt, and small quantities of gold, &c. are met with: but mining industry is altogether neglected. Hempen cloths, woollen yarn, and woollen cloths, with a few other articles, are made; but these are almost the only manufactures. Next to cattle breeding, the transport of goods across the Simplon is the principal occupation of the inhabs., for which purpose many mules are bred. The mineral waters of Brig and Leuch are of some advantage to the canton, being resorted to by a good many invalids.

This canton is divided into 13 districts, called *dizains*; Sion (Germ. *Sitten*), on the Rhone, a town of 2,500 inhabs., a bishop's see, is the cap. The supreme power is in a diet, composed of four deputies from each *dizain*, chosen for two years by the *dizains* above the age of 18 are elected by all the citizens. The *dizains* are mems. of the years. The presidents of the diet are mems. of the diet by virtue of office, and the bishop of Sion has a vote in the diet equivalent to four votes. The diet meets annually on the first Mondays in May and Nov. The ex-

entive power is in a state council of five mems. elected by the diet, and who are all re-eligible, except the *grand-bailii* or president, who is eligible only after an interval of two years. Each commune has a court of primary jurisdiction; from which, appeal lies to the district tribunals: the supreme court for the canton consists of 13 judges, nominated by the diet for two years, but always re-eligible. In respect of education, the Valais is behind most other parts of Switzerland. The public revenue, derived chiefly from salt and transit duties, is estimated at about 200,000 Sw. livres.

The inhabitants of the *Bas-Valais* are chiefly of the French, and those of the *Haut-Valais*, of German descent. The Valais formed a part of the Burgundian, and afterwards the Frankish, dominions; it next became subject to its own count-bishops; but in 1032, it was annexed to the Germanic empire. It was allied, not associated, with the cantons that formed the Swiss Confed. in the 14th century. In 1798 it entered the Confed. as a canton; but in 1802 was detached from it to form a separate republic under the protection of France. In 1810, it was incorporated with the French empire as the dep. of the Simplon; and in 1815 it again became a canton of the Confed., in which it holds the 20th rank, contributing 1,240 men to its army, and 9,600 to its treasury. (*Picot, Statist. de la Suisse; Ebel; Bakewell; Corder's Italy, &c.*)

VALDIVIA, a town and harbour of Chili, prov. of same name, of which it is the cap. The town, on the river Calacutta or Valdivia, about 16 m. from its mouth, is an insignificant village of wooden huts, and was, for the most part, ruined by the earthquake of Nov. 7. 1837; but the harbour is probably the finest, as it is one of the most strongly fortified, in the Pacific. It is in lat. 39° 53' 20" S., long. 77° 33' 24" W., and consists of an estuary, formed by the Valdivia and several smaller rivers, entered by a narrow strait, the shores of which are lined by numerous batteries, mounting, in all, nearly 130 pieces of cannon. Ships of the line ride here in perfect safety; the depth of water, in the centre of the bay, being from 6 to 7 fathoms, and close to the shore 5 fathoms. During their struggle for independence, this valuable station was captured, with a very inferior Chilean force, by Lord Cochrane, on the 3d of Feb. 1820. (*Miers's Chili; Voyage of the Adventure and Beagle.*)

VALENCE, (an. *Julia Valentia*), a city of France, cap. of the dep. Drôme, on the Rhone, here crossed by a handsome suspension bridge, 99 m. S. Lyons. Pop., in 1836, 9,390, or, inc. comm., 10,967. "Valence lies pleasantly on the left bank of the river, surrounded by a fertile country, abounding in mulberry, almond, and other fruit trees. Opposite the town, a conical hill rises close to the Rhone, and about a mile beyond, a long range of vine-covered hills runs parallel with the river, producing the different species of St. Peray." (*Ingليس's Switzerland, &c.*) The wine now alluded to, and which is not so much known in England as it deserves to be, is a dry white wine, characterised by great delicacy and sprightliness, and a flavour that partakes of the odour of the violet. When bottled in the spring following the vintage, St. Peray effervesces like Champagne. (*Henderson on Wines*, p. 176.) The town is enclosed by an old wall flanked with towers, and entered by several gates. It is irregularly laid out; but is pretty well built, and has latterly been much improved, both in its houses, a large proportion of which are of stone from the quarries of St. Peray, and in respect of cleanliness. It has several public squares and promenades, as the *Champ de Mars*, planted with trees, the *place d'Orléans, aux Clercs, &c.* The cathedral or church of St. Apollinaris is a building said, by Mr. Wood, to be in a degraded Roman style. (*Lettres*, l. 166.) It has a large square tower of four stories, and in the interior is the tomb of Pope Pius VI., who died, at Valence, in 1799, with a bust of that pontiff by Canova, and some fine paintings by A. Caracci and other artists. Near this church is a private mausoleum, worth notice for its architecture. The barracks and citadel, the old residence of the governor, the court-house, prison, public library with 15,000 vols. and theatre, are among the principal buildings. Near the town is the polygon, a ground for the artillery-school practice.

Valence is a bishop's see, the seat of a court of primary jurisdiction, a common college, ch. of manufactures, societies of agriculture, commerce, and arts, &c. It has two seminaries, a school of design, several asylums, a convent, a Lutheran church, a yard for building boats for the navigation of the river, manufactures of cotton goods, silk organzine, gloves, hosiery, leather, and earthenware, with marble works, lime and brick kilns, and sawing yards. It is a depot for the wines, silk, and other produce of the S. of France, and has six fairs a year. It was anciently the cap. of the Segalauni, and became a Roman colony under Vespasian; but it possesses no Roman antiquities. It formed successively part of the kingdoms of Burgundy and Arles, and of the dominions of the counts of Provence and Toulouse;

It subsequently became the cap. of the Valentinois, and was governed by its own feudal nobles till ceded to Louis XI., in 1449. From the 4th to the 13th century 8 church councils were held in Valence. (*Hugo, Art. Drôme; Guide du Voyageur, &c.; Ingليس; Woods's Dict. Geog.*)

VALENCIA, a kingdom or grand division of Spain, in the E. part of the peninsula, principally between the 38th and 41st deg. of N. lat., and 0° 35' E. and 1° 35' W. long., consisting of a long and comparatively narrow strip of country, extending along the Mediterranean, which bounds it on its whole length on the E.; and having an inland from the N. round to the S. Catalonia, Aragon, New Castile, and Murcia. Area, 7,683 sq. m. Pop., about 969,000. This is, upon the whole, one of the finest and most productive parts of the peninsula. A great proportion of the surface, particularly in the N. and W., is mountainous and rude; but the plain country, which stretches along the coast, and is watered by the Guadalquivir, Xucar, Mogra, Segura, &c., is a species of garden. All travellers coincide as to its extreme beauty, and superior cultivation, compared with the rest of Spain. Ingليس, who has travelled over many of the finest parts of Europe, says, "The view of the plain is superb. Though not green, it is more beautiful than the vale of Murcia, its immense extent and great populousness produce a more striking effect. The plain is probably little less than 30 m. long, and 20 wide; on three sides it is bounded by the mountains, and on the 4th by the sea; and throughout the whole of this vast extent, there is not an acre that does not produce its crop of grain, vegetables, or rice. The olive, mulberry, flex, algarob, orange tree, and palm, with all of which the plain is thickly dotted, give it the appearance of a union of garden and orchard; but the populousness of the plain is even more striking than its beauty and fertility. It forms altogether a prospect that, in richness and animation, cannot be equalled in any other country."

"The plain of Valencia produces every kind of crop congenial to the climate: two and three crops in the year are taken from it, and the greater part of the land returns 8 per cent. The rice crops are among the most valuable; they are chiefly produced in the territory of Albufera, surrounding the lake of the same name. This was the property first proposed to be granted to the Duke of Wellington, but the Cortes of Valencia objected to it, and the estates near Granada were substituted. The rice grounds produce only one crop in the year, but the return is from 8 to 10 per cent. The rice is put into the ground in June, and cut in September; water is then let in upon the ground, and when the stubble rots, the land is ploughed up, and no other manure is required. In Valencia and its neighbourhood, rice is in universal use by all classes, but the produce is much greater than the consumption of the plain; and the surplus is exported to the different parts of Andalusia. The whole produce is estimated at 12,000,000 arrobas, one half of which at least is exported; and the average price may be taken at about 3s. the arroba, or nearly 1½d. per lb. The other chief product is the white mulberry, once the source of great riches, through the silk factories of Valencia. The produce of silk from the plain is now computed at about 1,000,000 lbs. a year; by far the greater part is exported in its raw state, at an average price of from 8s. to 10s. per lb. The export of fruit from Valencia is large, particularly of raisins; these are of two kinds, the muscatel and an inferior raisin; but neither is equal to the raisins of Malaga. In 1829, 47,000 quintals of the best, and 42,000 of the inferior sort, were exported exclusively for the English market. The export of figs, oil, and wine from the prov. and different parts of Valencia, is also considerable; particularly the latter, called *Beni Carlo*, exported from the town of the same name. This wine is sent chiefly to Cetto, from whence much of it finds its way, by the canal of Languedoc, to Bordeaux, to give body and colour to the clarets." (*Ingليس*, li. 258—262.) Barilla, sugar-cane, saffron, aniseed, &c., are also grown.

But, despite the abundance of the prov., the peasantry, as is frequently the case in the most productive parts of the Continent, appear to be in a very depressed condition. The *huerfa* of Valencia, says Ingليس, belongs, for the most part, to great proprietors. The Duke of Medina Celi has a revenue of 75,000 dollars a year from his estates there, and the families of Villa Hermosa and Benavente have almost as much; and, in fact, there are very few persons who cultivate their own land. And, though state taxes do not weigh down industry in this prov., the Valencians are subject to heavy feudal services and seigniorial demands, levied in kind on the produce of the soil, amounting to 1-7th, 1-6th, and, in some places, 1-4th, of the crop! (*Mod. Trav.*) But these circumstances do not sufficiently account for the depressed condition of the peasantry; which is rather to be explained by the fewness of their wants, originating in the mildness of the climate, and their want of all desire to improve their situation.

No great number of cattle or horses are kept; and the

sleep, though pretty numerous, yield wool of only a mediocre quality. A good many tunnies are taken on some parts of the coast by a method similar to that practised in the Neapolitan dom. Mercury, copper, sulphur, arsenic, argentiferous lead, iron, coal, &c., exist in many places; but are procured only in small quantities. Salt from springs, marble, and potters' clay are the principal mineral products. Manufactures are unimportant: woollen and linen fabrics are indeed made in most of the towns, and silk goods in Valencia, Gandia, &c., but, at present at least, in very inconsiderable quantities. Cordage is made from the fibre of the esparto (*stipa inaequalis*), also, *juncus*, &c., and tiles, similar to the Delft manufacture, soap, glass, paper, &c., are made in small quantities. An active internal traffic is kept up, the N. supplying the S. districts with timber, earthenware, linen and woollen stuffs, esparto, brandy, cattle, &c.; while the latter send to the former corn, fish, Levant produce, silk, algarrobs, &c.; Valencia sends rice, silk, fruit, and fish to Aragon and Castile, for corn, wool, and cattle; and flax, hemp, silk, oil, rice, soap, &c., to Murcia and Granada. Its foreign commerce is chiefly with Italy, England, France, Holland, and S. America; from which countries, corn, salt fish, ship-timber, pitch, tar, iron, sea linens, and other necessaries are imported. Alicante, Valencia, Vinaroz, Murviedro, Benicarlo, and Guardamar, are the principal ports. (*Fischer's Picture of Valencia*.)

Very different opinions respecting the character of the pop. have been entertained by different travellers. Upon the whole, the Valentians would appear to be an airy, lively, active, but effeminate people, very different in manner from the Castilians; while their character forms apparently a still stronger contrast to the savage horism of the Catalonians and Aragonese. Their dialect, though much akin to the Catalanian, is said to differ from it in retaining more of the provençal. (*Mod. Trav.* xviii. 167.) This prov. was successively subject to the Carthaginians, Romans, and Visigoths, from whom it was taken by the Moors in 713. They held possession of it till 1238, when it was conquered by the Spaniards and annexed to Aragon. It afterwards formed a component part of the Spanish monarchy, but continued to preserve its representative body and its privileges, till the early part of the 18th century, when having, in the War of the Succession, taken part against the Bourbon dynasty, it was, on their establishment on the throne, deprived of its old constitution, and obliged to conform to the laws of Castile. (*Milano; Antillon; Inglis's Spain; Swinburne; Townsend, &c.*)

VALENCIA (AN, *Valentia Eboracorum*), a city of Spain, cap. of the above kingdom, on the Guadaluvar, about 4 m. from its mouth, and 184 m. E.S.E. Madrid. Lat. 39° 28' 55" N.; Long. 2° 13' W. Pop. 65,840. (*Milano*.) It stands in a wide plain on the bank of the river which washes its walls, and separates it from its suburbs, with which it communicates by 5 bridges, of from 10 to 13 arches. The city is nearly circular, and about 2½ m. round, enclosed by massive walls, with towers, and 4 gates. The old streets are crooked, narrow, unpaved, and frequently destitute of thoroughfare; but some new quarters have been laid out, with broad streets and squares which are said to be well paved and well kept. Valencia is well lighted, and guarded by a patrol of watchmen, termed *serenos*. It is furnished with public sewers of great solidity, which some affirm were constructed by the Romans; and it has many private wells, though only one public fountain. Good quays faced with stone, and planted with trees, line the river in the whole length of the city. A fine view is obtained from any one of the bridges; the line of irregular buildings following the curve of the river, and the bridges, one beyond another, with the great Moorish gates, give it an air of much grandeur. Few cities, even in Spain, have, or rather had, so many religious edifices as Valencia: among these were reckoned no fewer than 27 convents for men and 22 for women, 16 churches and 24 chapels and hermitages, amounting altogether 86; so that we need not wonder that the streets abounded with friars and priests, and that the influence of the religious bodies was predominant! (*Inglis*, ii. 251.) The cathedral is of Intermixed Greek and Gothic architecture, surrounded by a dome. It has numerous altars, a good deal of fine marble, some bas-reliefs, and paintings by some of the first Spanish masters. It is very rich in plate and relics. Some of the churches have domes, but the greater part tall, slender turrets, with all sorts of pilasters and whimsical devices. In the multitude of sacred edifices, some may be found that excel in particular parts, or strike by the richness of their decorations; but all are overladen with ornaments. (*Swinburne's Trav.* i. 153.) In most, however, are fine paintings by Juanes, Espinosa, Ribalta, Ramirez, Victoria, a pupil of Carlo Maratti, and many other artists, all natives of Valencia. The famous Supper of Ribalta is in the Corpus Christi College: and the same subject by Juanes, a work reckoned among

the finest pictures of Valencia, is in the church of St. Nicholas, which also possesses sundry other fine pictures.

The exchange, custom-house, the temple, a palace built for a military order, by Charles III., the archbishop's palace, college of Pius V., and several noble residences are worthy of notice; there are 5 hospitals, one of which is a large establishment for medical treatment of all kinds, several asylums, prisons, barracks, a theatre, &c. Inglis says, "Valencia is one of those cities, in which traces of Moorish dominion are the most visible; not in any splendid Alhambra or Alcazar, but in every day sights and common objects. Gateways are occasionally seen sculptured in marble upon Moorish designs; stones over the doors, or underneath the windows, show by their chiselled marks their ancient fashioners. All the Moorish tokens also distinguish the pop. of Seville, Malaga, and San Felipe, are found in even greater distinctness in Valencia." (*Spain*, ii. 253.)

The university, founded in 1411, was formerly considered the best in Spain, particularly for the study of medicine. In 1830, it had nearly 2,500 students, who were principally divided between law and philosophy. The professors, of whom there are about 70, are friars, except those who instruct in law: their salaries are from 50*l.* to 130*l.* a year. Lectures are delivered from Oct. 11 to May 31. Education in the university is nearly gratuitous, and many of the students were in the habit of receiving portions of the food distributed daily from the convents. The university library has not more than 15,000 vols., but its deficiencies are compensated by a good library in the archbishop's palace, with attached cabinets of antiques, medals, &c., open for 6 hours daily. There are 6 other colleges, and many inferior academies: the royal academy of Saint Charles, for the instruction of students in the fine arts, is the only institution in the city not under the superintendence of the priests.

The manufactures of velvets, taffetas, flowered damasks, and other silk stuffs, are said, at the end of last century, to have employed upwards of 3,000 looms; but if so, they have greatly declined in the interval. The existing manufactures comprise woollen fabrics, canlets, hats, table and other linen, gauzes, artificial flowers, leather, glass, paper, &c., with the "Valencia tiles," used for the flooring of houses in all the cities of the S. of Spain. These tiles are at once cool, and highly ornamental; but they are far from cheap, those of the best quality being much more expensive than an equal extent of the most sumptuous carpeting. A good workman employed in painting the tiles earns about a dollar a day.

The port of Valencia is at Grao, about 2 m. distant. It is connected with the city by a broad planted avenue, forming the favourite public promenade around the city. The harbour is suitable only for boats, and the roadstead is exposed to the S. and S.W. gales. The climate, though hot, is agreeable and healthy; and the city is a good deal resorted to by invalids. Society in Valencia appears to differ little from that in other S. Spanish towns. Many persons of rank and wealth reside here, but without any display. Travellers bear testimony to the agreeable vivacity, ready wit, freedom from affectation, and obliging disposition of the inhabitants. But Inglis says, that in Valencia, more than in any other city, he was struck with the absence of mental cultivation. But we apprehend the traveller must have been unlucky in his acquaintance. Mental culture may and most probably is at a low level; but the city which is the seat of perhaps the most flourishing university in the country, which has, also, produced many distinguished natives, and in which the first printing-press introduced into Spain was established, is not likely to be the zero of the intellectual scale.

Valencia was held by the Moors from 715; but taken in 1091, by the celebrated Gid, Ruiz de Diaz de Bivar. After his death it was governed by his widow Ximene, under whom it sustained successfully one siege against the Moors of Cordova, but ultimately capitulated to them in 1101. It was retaken by James I. of Aragon, in 1238, and peopled afterwards with Catalans and French settlers. It was taken by the French under Suchet, in 1812, and held by them till June, 1813. (*Milano*, &c., *ut supra*.)

VALENCIA (NUEVA), a city of Colombia, repub. Venezuela, prov. Carabobo, in a plain about 3 m. W. of the Lake of Valencia, and 18 m. S. by E. Puerto Cabello. Pop. estimated at 16,000. It covers a large extent of ground, most part of the houses having only a ground-floor. The streets are very broad, and the town-plot-place is of great size. The entrance to the town from the N. is by a good bridge of three arches built of stone and brick; near which is the *glorieta*, a large circular space where the inhabs. meet in the evening for dancing and festivity. Humboldt says, "It is regretted, and perhaps justly, that Valencia has not come the capital of the country." Its situation near Puerto Cabello, with which it is said to communicate by a good road, gives it many advantages, and it is a place

of brisk traffic. But it has the great disadvantage of being infested with white ants, whose excavations underground at certain seasons become very dangerous to the buildings of the city.

The Lake of Valencia or Taccarigan is larger than the Lake of Neuchâtel in Switzerland, but in its general form it has a nearer resemblance to that of Geneva, which is about the same height above the sea. The opposite banks of the lake also offer a similar contrast. Those on the S. are desert and almost uninhabited, and a screen of high mountains gives them a gloomy and monotonous appearance: the N. shore, on the contrary, is cheerful, pastoral, and set off with sugar, coffee, and cotton plantations. There are numerous islands in this lake, the waters of which are gradually diminishing. Its mean depth is from 12 to 15 fathoms; where deepest, it is not more than 40 fathoms. It abounds with fish, and is used for the purposes of commerce; but it is a singular fact, that for more than two centuries none of its navigators ever thought of using a sail! An English traveller, of no very distant period, says that a native of Biscay, settled in Valencia, had then first tried the experiment, "and the circumstance formed no small part of the conversation of those who were assembled at the pulperia of La Cabrera." (*Mod. Trav.* xxviii. 178.; *Humboldt, Pers. Narrative*, iv. ch. xvi.; *Cudazzi, Geog. de Venezuela*; &c.)

VALENCIENNES (an. *Valentiane*), a town of France, dép. du Nord, cap. arrond.; on the Scheldt, where it is joined by the Rhonelle, 28 m. S.S.E. Lille. Lat. 50° 21' 27" N., long. 31° 31' 55" E. Pop., in 1836, ex. com., 16,679. It is a secondary fortress, and has a citadel constructed by Vauban. It is tolerably well built, but ill laid out; a part of it was much damaged by the severe bombardment it received in 1793, the marks of which are still visible. The Scheldt intersects the town from N. to S., dividing it into two unequal parts.

There are several public buildings. The town-hall, built in 1612, is of mixed architecture, highly decorated, and contains some fine apartments; the second story is appropriated to a picture gallery, in which are some works by Rubens. Attached to it is a belfry, constructed in the 13th century, 180 ft. in height. The lower part of a handsome theatre serves for a corn-hall. The general hospital, founded in 1781, is one of the largest establishments of its kind. The public library has 18,000 vols. and the museum of natural history is rich in collections. There are military and foudling hospitals, barracks, magazines, an arsenal, a college, an academy of the fine arts founded in 1782, &c. Besides Valenciennes lace, a good deal of fine cambric, cotton yarn, hosiery, and blankets, iron plate and nails, starch, saltpetre, linseed oil, chicory, earthenware, and toys, are made in the town, which has also cotton-printing works, tanneries, distilleries, and salt refineries; and a considerable trade in wine, brandy, oil, soap, timber, and charcoal.

Valenciennes has sustained several sieges, the most memorable of which took place in 1793, when it was invested by an Anglo-Austrian army under the late duke of York, to whom it surrendered at the end of six weeks, during which the besiegers sustained great loss. It was retaken by the French from the Austrians in the ensuing year. Among the many distinguished natives of this town have been—Froissart, the historian of chivalry, Watteau, the painter, and D'Argenson, the minister. (*Hugo, art. Nord*; *Guide du Voyageur*, &c.)

VALERY (ST.), usually called St. Valéry-en-Caux, a town and sea-port of France, dep. Seine-Inférieure, cap. cant.; on the British Channel, 334 m. N.W. by N. Rouen. Pop., in 1836, 5,236. Its port, enclosed between two cliffs, is small, and not fit for the accommodation of vessels of considerable burden. St. Valéry has manufactures of soda and cotton thread, with some trade in the exportation of Rouen fabrics, and in the importation of timber, dried fish, corn, &c. Many of its inhabs. are engaged in the cod, herring, and mackerel fisheries, and they enjoy the reputation of being good seamen. The country round is mostly in pasture.

St. Valéry-sur-Somme is another sea-port town, on the N. coast of France, dep. Somme, 11 m. N.W. Abbeville. Pop., in 1836, 3,285. Its port is much larger than that belonging to the above town, and admits vessels of from 300 to 400 tons. It has large salt magazines, with manufactures of cordage and sail-cloth, and a brisk general traffic: of late years, an intercourse by steam has been occasionally kept up between this town and London. (*Hugo, art. Seine-Inférieure and Somme*; *Dict. Géog.* &c.)

VALETTA (I.A.). See MALTA.

VALLADOLID (an. *Philia*), a city of Spain, cap. prov. and dep. of its own name, in Old Castile, on the Pisuerga, here crossed by a stone bridge of 10 arches, where it is joined by its tributary the Esqueva, over which many small bridges are thrown. 73 m. S.W. Burgos, and 100 m. N.W. Madrid. Lat. 41° 45' N., lon. 4° 42' W. Pop. 20,960 (*Milano*). It stands in a plain bounded by limestone hills, and is surrounded by an old

wall which encloses a large extent of ground. Swinburne says "Valladolid is a very large rambling city, full of edifices, which, during the reign of Philip III., who made it his constant residence, were the palaces of his great officers and nobility. Being abandoned by their owners, who have fallen to decay, and exhibit a picture of the utmost desolation." The private houses are ill-built and ugly. The great square, some streets built upon porticoes, and many colleges and convents, are still grand, and denote something of former magnificence; but in general, Valladolid has the appearance of having been run up in a hurry to receive the court, and as if it had been meant to rebuild it afterwards, at leisure, of more durable materials than bad brick and mud, the composition of most of its present houses." (*Trav.*, ii. 254, 285.) Upon passing the first gate from the Madrid road, the traveller enters the *campo grande*, a spacious area surrounded by 17 convents, the scene of repeated *auto de fe's*, signalled by the burning of not a few heretics.

Valladolid has, or recently had, 16 par. churches, upwards of 40 convents, 9 chapels, 8 colleges, 3 hospitals, several asylums, barracks, &c., though, except some of the religious buildings, none deserve much notice. The cathedral, an unfinished edifice, built by Juan de Herrera, at the expense of Philip II., was intended to have been one of the most sumptuous in Spain; but, according to Townsend and others, it is heavy and inelegant. The church and convent of St. Benito are handsome, but the church of St. Paul is probably most worth attention, from its general elegance, and the finish of its bas-reliefs and ornaments, which, after a lapse of 300 years, seem to have suffered little by their exposure to the weather. (*Townsend*, i. 365.) Laborde speaks of fine sculptures by Gregory Hernandez, &c., in this and several other churches of Valladolid; but whether they have been removed is more than we can undertake to say. The royal chancery is a large and fine structure in the Tuscan order. The old palace, in which Philip II. and III. were born, is an utter ruin; when Twiss visited the city its bare walls only were standing.

Valladolid has a university founded by Alonzo XI. in 1346; it was formerly distinguished for its school of jurisprudence, and continued to flourish till the end of last century; and it appears, even now, to be more frequented than Salamanca. Among the colleges of the city were one for the Scotch and one for the English, both of which were well endowed. The school of the fine arts is privileged as an academy, and has a superior collection of models in sculpture, architecture, and painting.

Valladolid was formerly an opulent commercial city; but its manufactures of woollen stuffs, hats, silk ribands, linen and cotton yarn, paper, liquorice, perfumery, earthenware, leather, &c. are now little more than sufficient to supply the wants of the town. Its trade, however, would most probably increase were the Pisuerga made navigable to the Douro, only 10 m. distant. The country round produces white wine, of good quality, madder, silk, olives, &c., and coal is said to abound in the neighbourhood, though, if the statement be correct, little, if any, use is made of this valuable material.

Valladolid is the see of a bishop, under the archbishop of Burgos, the residence of a captain-general, military intendant, *corregimiento*, &c. It was incorporated as a city, and made a bishop's see by Philip II., and was the residence of the court from his time till that of Philip IV., who removed to Madrid. Columbus, the discoverer of the New World, expired in this city on the 20th May 1506. (*Milano*; *Swinburne*; *Townsend*; *Twiss*; *Mod. Trav.*, xix., &c.)

VALLADOLID, or MECHACAN, a city of Mexico, cap. intend. of same name, in a fine valley, 120 m. W.N.W. Mexico. Its pop. early in the present century was estimated at 18,000, and is probably about the same at present. Mr. Ward says, "I know few places the approach to which (from the N.) is so tedious as that to Valladolid. For more than two hours you see the city apparently below you, while the road continues to wind among the surrounding hills. At length a rapid descent conducts you to the plain, where a long causeway, built across a marsh, forms the entrance to the town. The suburbs are poor and insignificant, but the high street is fine, and the cathedral, standing alone and open, has a very imposing effect. The view of the town from the Mexico side is beautiful: gardens and orchards form the foreground; while the lofty aqueduct, erected toward the end of the last century, the gorgeous churches, and a bold range of mountains behind, fill up the remaining space. Nearly all the public edifices, not immediately connected with the government, are due to the munificence of the bishops, most of whom have contributed to enrich or adorn the town. The cathedral, hospitals, and aqueduct are all the works of the Church. The first is a magnificent building, and wealthy, though despoiled of much of its treasures during the revolution." (*Ward's Mexico*, ii. 371—377.) Valladolid has a handsome public

promenade; and its climate is temperate, as it stands nearly 6,400 ft. above the level of the sea. Iturbide, the short-lived Emperor of Mexico, was a native of this city.

Valladolid is the name of another Mexican town in Yucatan; but it is of no great importance.

VALOGNES, a town of France, dep. Manche, cap. arrond., on the Merderet, 12 m. S.E. Cherbourg. Pop. in 1836, ex. comm., 6,634. It is a well built town, and has a handsome communal college, and public library, with 15,000 printed volumes; manufactures, on a small scale, of earthenware, lace, gloves, and leather; and some trade in provisions and shell fish for the Paris market. The ancient Roman town *Alauna* was situated in its vicinity. In the middle ages it had a strong castle, which, however, has been totally destroyed. Tournier, the translator of Shakspeare, and the celebrated anatomist Vicq-d'Azyr, were natives of Valognes. (*Hugo, art. Manche, &c.*)

VALPARAISO, the principal sea-port town of Chili, prov. Santiago, on the Pacific, 60 m. N.W. Santiago. Lat. 33° 11' 59" S., long. 71° 31' 8" W. Pop. probably about 10,000. It is inconvenient and ill-built, but its appearance from the sea is imposing, being built, somewhat like Hastings, at the foot of a precipitous range of hills. It consists chiefly of a straggling long street, or rather terrace, for it is built only on one side, with some narrow and inconvenient thoroughfares leading out of it up the several ravines. In one of these is the plaza, a small triangular space, where the market is held; and near it are the principal church, the Dominican and Franciscan chapels, &c. A little to the N. is the castle of Antonio, mounting about a dozen guns; and between it and the plaza are a number of low buildings and sheds, termed the arsenal. In the N. quarter of the town, in a recess larger than the other ravines, is a collection of narrow lanes and mean houses; and many isolated dwellings are scattered about among the hills, the only access to which is by winding foot-paths. The suburb Almendral, on the sandy shore, where there has been more room to build, consist mostly of a ground floor only; but in the town of Valparaiso all have stories above the ground floor. They are in general painted of lively colours. About the middle of the Almendral are the ruins of the church and convent of La Merced, which, like many other buildings in Valparaiso, was destroyed by the earthquake of 1822.

The bay of Valparaiso is open to the N., but sheltered by heights on all other sides; and the holding ground, being mostly a stiff clay, offers a secure anchorage, except during N. gales. Opposite the custom-house, 100 yards from the shore, there are 5 fathoms water, which suddenly deepens to 10 and 20 fathoms, at the distance of 300 yards, and in the centre of the bay are from 26 to 30 fathoms. (*Miers, i. 441.*) The harbour is defended by the castle, and four forts at the N. end of the Almendral, and another fort inland. There is no mole, nor any facility for landing goods, except by launches, which are moored to the shore, and across which all packages are brought on men's shoulders; or by boats, which, however, can land in all weathers, in the Fisherman's Bay, between the castle and Fort St. Antonio. There are generally a considerable number of vessels in the bay, the greater part British and American; and Valparaiso continues to be the central depot for the trade of Chili. Large quantities of corn are shipped here for Callao and Panama, especially the former. Wheat, tallow, hides, copper, the precious metals, indigo, wool, and sarsaparilla, are among the principal exports. The market of Valparaiso is well supplied with meat, poultry, fish, bread, fruit and vegetables, at very moderate prices, and of good quality; and its climate is generally agreeable. (*Stevenson's S. America, iii. 161.*) Unless, however, it have materially altered of late years, it would appear, from Mr. Miers' report, to be subject to many drawbacks as a place of residence. "Independent of the want of society, there exists no public amusement, no theatre, commercial reading or news-room, no parade, not even a single spot to walk upon, nor any retirement or exit from the town, but over the barren steep hills, which renders the exercise more a toil than a pleasure. In short, in spite of its matchless and beautiful climate, I do not know in all Chili a spot presenting a more uncomfortable and cheerless place of residence than Valparaiso." (*Miers' Trav. in Chili, i. 449; Commercial Dict., &c.*)

VAN, a city and considerable lake of Asiatic Turkey, pass. of same name, the city being on the E. bank of the lake, 140 m. N. by E. Mosul, and 145 m. S.E. Erzeroum. Pop., according to Col. Shiel, 12,000; but this is most probably much under the mark, seeing that it had been previously estimated by Kinnel at 50,000, and has since been estimated by Mr. Grant at 7,000 families, which would amount to at least 40,000. The inhabs. consist of Turks, Kurds, and Armenians. It is situated in a fine plain, covered with gardens, nearly 5,500 feet above the sea, at the S.W. foot of an isolated rock, on which is its

## VAN-DIEMEN'S LAND.

citadel. It is inclosed with double walls of mud and stone, having large round and small square bastions, and is farther defended, though not on all sides, by a ditch. "The streets are narrow, dirty, and ill paved; the exterior appearance of the houses in general mean: there was, however, to be seen occasionally a residence, which showed that it had once belonged to a man of consequence; but the general aspect of the city indicated decay. The bazars were confined, and the shops ill-furnished; and I scarcely saw an article of European manufacture; there was, however, an abundance of Venetian glass beads, with which the Kurd females ornament their persons. The supply of fruit was superabundant." (*Brant, in Geog. Journ. x. 384.*) The account of the city given by Kinnel is less unfavourable; but Brant's, being the later, is perhaps also the more accurate.

It has 2 large Armenian churches, 4 large mosques, several baths, caravanserais, &c. The great boast and dependence of Van is its gardens, which cover an extensive area between the city and the mountains. They comprise vineyards, orchards, melon-grounds, fields, &c. In summer the inhabs. of the town mostly reside in the gardens, the roads in which being lined with houses, the whole appearing like an extensive village. Streams, bordered with willows, run through the main avenues. (*Brant, in Geog. Journ. x. 391-3.*)

The castle on the N.E. side of the town is built on a high and abrupt limestone rock, and, if the works were in proper repair and efficiently manned, would be all but impregnable. There are some very extensive excavations in this rock.

The trade of Van is at present inconsiderable. About 500 looms are employed in manufacturing coarse calicoes from cotton imported from Persia, mostly for home consumption; though some are sent to Bitlis to be dyed and exported. Almost the only other articles of export from Van, are fruits, wine, and grain, the produce of the surrounding gardens and fields. Every person of respectability keeps a house in town, with a country house, an orchard and vineyard, and perhaps a few fields. Most of his wants are supplied from his garden, or from the profits of a petty trade carried on with a capital of from 20*l.* to 100*l.*

There can be no doubt that Van is very ancient. The walls of the castle are in part Cyclopean, and many inscriptions in the cuneiform character have been discovered in the town and its environs. It is even affirmed that the castle was originally founded by Semiramis; but it is almost needless to say that there is no evidence by which to support this very improbable statement. Timour Bec, or Tamerlane, who took Van towards the close of the 14th century, is said, by the Persian writers, to have endeavoured, though ineffectually, to destroy its ancient monuments.

The Lake Van, the *Arasis* of Ptolemy, is of a very irregular shape; greatest length N.E. to S.W. 70 m.; greatest breadth about 28 m. Area estimated at 1,800 geogr. sq. m. (*Geog. Journ. x.*) It seldom freezes to any distance from the shore, except at its N.E. end, where, being shallow, in severe winters, it may be crossed on the ice. It has several islands, on one of which is an Armenian monastery. It is navigated by 5 or 6 crazy boats, which are sometimes employed to convey cotton cloths to Tadvan on their way to Bitlis, bringing back grain and timber. From the many wild fowl that frequent it, there is no doubt that fish abound; but the fishery, however, occupies very few hands. (*Geog. Journ.; Kinnel's Pers. Exp.; Smith and Dwight's Missionary Researches, introd. &c.*)

VAN-DIEMEN'S LAND, or TASMANIA, an island belonging to Great Britain, in the S. Pacific and Eastern Oceans, off the S. extremity of Australia, from which it is separated by Bass's Straits, between lat. 41° 20' and 43° 40' S., and long. 142° 40' and 148° 20' E. It is shaped like a heart. Area, estimated at about 27,000 sq. m. Pop., in 1838, 45,846; of whom 26,655 were free, and 18,133 convicts: the number of aboriginal inhabitants is very trifling. The country is in general hilly or mountainous. Captain Fitzroy says, "The change of scene from Sydney to Hobart Town was as striking as a view of Gibraltar or Madeira after leaving the Downs. Comparatively speaking, near Sydney the land was light-coloured and level, while in Van-Diemen's Land we almost thought ourselves in another Tierra del Fuego." (*Logage of the Adventure, &c. ii. 624.*) The mountains rise to 3,500 or 4,000 ft., not forming continuous ranges, as in the adjacent continent, but generally isolated peaks. The surface consists alternately of elevated table lands and fertile valleys, most part of it being fit either for cultivation or pasturage. Several considerable rivers water the colony. The principal are the N. Derwent, and Tamar formed by the union of the S. Esk, all which rise towards the centre of the island, in about lat. 42°; the first running to the S.E. and the rest Northward. There are several large lakes in the interior, one of which is said to be 60 m. in circ.

The coasts are very much indented, and abound with excellent harbours. The climate is comparatively healthy, being apparently more congenial to European constitutions than that of Sydney. The winters are colder; but the country seldom suffers from those long-continued droughts which are the bane of New S. Wales, nor from too much rain. Sandstone, limestone, and basalt, are among the principal geological rocks. Indications of coal have been met with, and iron ore has been dug up, some of which is said to yield as much as 80 per cent. of metal. Copper, lead, zinc, and manganese exist, but no mines have been hitherto wrought. The upper soil is usually sandy or argillaceous; or else consists of a rich vegetable mould. There appears to be comparatively a much larger proportion of good soil than in Australia; fine tracts of land are found quite down to the borders of the sea, a circumstance unusual in the last-named continent; and extensive tracts covered with luxuriant herbage, and free from timber or underwood, and which, consequently, require no clearing on the part of settlers previously to being ploughed, are met with in all parts of the interior. Timber, however, is by no means scarce; and in 1838, 435,732 cubic ft. were cut at Port Arthur, of which nearly 3-4ths were exported. The Huon and Adventure bay pines, and the black wood, are peculiar to the country: in most other respects the vegetable products, as well as the animals, are similar to those of Australia. A species of panther, which commits much havoc among the flocks, and kangaroos are found in great numbers; there is, however, no native dog. Poisonous reptiles are less numerous than in the adjacent continent. The aboriginal inhabitants appear to belong to the negro race of the E. Archipelago; they seem to be sunk in the lowest depths of barbarism; and are said to be ignorant even of the most useful and obvious arts, as fishing, and the construction of the rudest canoes. Their numbers have rapidly decreased since the establishment of the whites, and a few years since the greater part of those remaining in the colony were removed to Flinders' Island in Bass's Straits.

The only settled portions of Van-Diemen's Land stretch across the interior from the N. to the S.E. coast along the courses of the Derwent, Tamar, and other rivers. All the W. and the N.E. parts of the island are yet not merely unsettled, but even unexplored.

From 1824 to 1838 inclusive, the grants of land to settlers in the colony appear to have amounted to 1,128,000 acres, by far the greater proportion of which was in grants of 500 acres and upwards. The average price per acre in the last-mentioned year was £s. 104d., and the total sum that accrued to the government from the sale of land during the decennial period ending with 1838 amounted to 147,370*l*. The plan of selling the unappropriated land by auction is now adopted in this colony, as in most others belonging to England. In 1839 the sales in this way amounted to 42,386 acres, at 10*s*. 13*d*., exclusive of certain town lots, the sum received for the whole being 23,256*l*.; and during the same year 15,836 acres were granted by the crown in reward of military and naval services. In 1840 the sales of land amounted to 88,296 acres, at 11*s*. 4*d*., exclusive of town lots, the aggregate price of the whole being 55,305*l*.; the grants to military and naval men during the same year exceeded 3,500 acres. It is estimated that there are still in the colony above 12,000,000 acres ungranted. In 1838 about 108,000 acres were said to be under crop, including about 41,750 in wheat, 13,500 do. in barley, 21,600 in oats, 3,500 in potatoes, 9,100 in turnips, and 17,000 or upwards in grasses. The total produce of corn during the same year was estimated at about 969,000 bushels; of which, 567,000 were wheat. If these returns may be depended on, it would seem that at an average the produce of corn per acre amounts to little more than 12 bushels! or to only about 1-3d part of the produce of an acre of land in England! This lamentable deficiency of produce may be ascribed partly, we believe, to the backward state of agriculture, and the want of care in the preparing of the land, and partly to the inferior fertility of the latter. In fact, Van-Diemen's Land, though superior as a corn-growing country to New S. Wales, is notwithstanding better fitted for grazing than cropping. Wool, indeed, is here, as well as in Australia, the staple produce of the colony; and the increase in the breed of sheep has been so very great that the stock, which in 1828, amounted to 553,698 head, had, in 1838, increased to 1,214,000 head; and while the imports of wool from Van Diemen's Land into the U. Kingdom, in 1820, did not exceed 993,979 lbs., they amounted, in 1841, to 3,597,531 lbs. Maize is not raised in the colony, the climate being too cold. Apples, currants, gooseberries, &c., attain perfection, but the orange, citron, and pomegranate are not raised, and the grape and peach attain only an inferior degree of maturity.

In 1838, the stock of cattle was estimated at 75,000 head; of horses, at 9,650; and goats, at 2,400. All kinds of stock attain a much greater size than in the neighbourhood of

Sydney. Between 1824 and 1836, there was, owing to a variety of causes, an unprecedented rise in the value of all sorts of property in the colony, particularly of land, sheep, and cattle. Land, which in 1824 would not have realised more than from 5*s*. to 10*s*. an acre, was, in 1836, sold at prices ranging from 2*l*. to 4*l*.; and sheep and cattle, which in the former year might have been purchased for 5*s*. and 40*s*. respectively, could not, in the latter, be procured for less than 2*l*. and 12*l*. (*Statist. Rep.*) But since 1836, a fall has taken place in prices, wages, &c., which, though at first productive of inconvenience has, by putting an end to much extravagant speculation, been of decided advantage; and the colony is steadily advancing in population and prosperity. In 1838, 101 vessels of the aggregate burden of 8,342 tons, belonged to Van-Diemen's Land; of these 19, of about 2,000 tons burden, were employed in the whale fishery, which imported oil, &c., to the gross value of 98,660*l*. We subjoin an Account of the Import and Export Trade of the Colony in 1839 and 1840.

Countries from and to which Imports and Exports were made.	Value of Imports.		Value of Exports.

The great articles of export are wool, whale oil, and whale-bone, and bark. The imports comprise every description of manufactured goods, colonial products, wines, farming utensils, &c.

The government is subordinate to that of New South Wales; but the lieutenant-governor, with the aid of the executive and legislative council, administers the local government independent of the parent-colony. The executive council consists of 5 mems., including, with the lieutenant-governor, the chief justice, colonial secretary, and treasurer, and the officer in command of the troops. The legislative council is composed of from 10 to 15 mems., appointed by warrant of the sovereign; and all the above functionaries are *ex officio* mems. The laws of the colony are derived from the British parliament, and acts of the British parliament are generally administered in the colony, but special acts may be passed by the governor and council. The initiatory proceedings in the passing of all acts belong to the governor; and two-thirds of the council must be present at their passing, and the majority vote with the governor, or no proposition can become law. Civil causes are tried before a judge and two assessors, and criminal cases by a jury of seven naval or military officers. In most other respects this colony is administered in a manner similar to New South Wales. Public revenue in 1838, 138,891*l*.; expenditure, 133,681*l*. Of this expenditure 10,271*l*. was for the public schools, in which 1380 pupils were instructed.

The settled part of Van-Diemen's Land is divided into 15 districts. Hobart Town, or Hobarton, the cap., is in the district of same name, on the Derwent, about 20 m. from its mouth, lat. 42° 54' S., long. 147° 34' E. Pop. of the town and district, in 1838, 14,382; of whom 3,553 were convicts. The town covers about one sq. m.; it stands upon the declivities of two gentle hills, and is intersected by a fine stream from the heights of the Table Mountain, which towers above the town on the W. to the height of 3,536 feet. The streets are wide, and intersect each other at right angles; and, having been from the first laid out on a uniform plan, it is much more regularly built than Sydney. Its houses are substantial, and of 2 stories in height: it has some good public buildings, including a church constructed of brick, a jail, and a quay, close to which vessels of the largest burden load and unload. Hobarton possesses one of the finest harbours in the world. The Derwent, which here forms a fine sheet of water, is navigable for ships for 3 m. above the town, and continues to afford a safe passage for vessels of 50 tons as far as New Norfolk, 20 m. higher up, where a ridge of rocks abruptly puts an end to the navigation. In 1838, 72 ships, of the aggregate burden of 6079 tons, belonged to this port. The suburbs of Hobart Town are increasing and receiving much embellishment; villas, enclosures, &c. are said to be springing up in every direction. The principal settlement on the N. side of the colony is Launceston, on the Tamar, about 40 m. from its mouth, and 105 m. N. by W. Hobart Town. The river is navigable to it for vessels of 300 tons. The other towns are insignificant.

This island was originally discovered by the navigator Tasman in 1642, and subsequently received its name in honour of a governor of the Dutch E. Indies. It was

afterwards visited and partially explored by Cook, Furneaux, D'Entrecasteaux, &c.; but it was not ascertained to be an island till Bass sailed through the Straits which bear its name in 1798. The first English penal settlement was established here in 1803, and down to 1813 it continued to be merely a place of transportation from New South Wales. The settlement continued to suffer from the depredations of escaped convicts, termed bush-rangers, till 1817, when these were finally put down; voluntary emigration began to take place to a considerable extent in 1831, and has since progressively increased. (*Statist. Rep. on Van-Diemen's Land, &c.*)

VANNES, a town and sea-port of France, dep. Morbihan, of which it is the cap., at the bottom of the Gulf of Morbihan; 63 m. W.N.W. Nantes. Lat. 47° 39' 26" N., long. 2° 45' 4" W. Pop., in 1836, ex. comm., 9,398. It was formerly fortified, and entered by six gates, five of which, with some towers, still remain. It is clustered around its cathedral, and except one or two tortuous streets regularly and badly built, badly paved and dirty. The cathedral, rebuilt in the 15th century, is a massive, but heavy edifice; in its interior, however, are some good monuments and paintings. It has another church, and several chapels, one of which, attached to the communal college, is of good architecture. The prefecture is an ancient castle, and a convent has been converted into the residence of the bishop. There were formerly many monastic establishments at Vannes; but their buildings have now mostly received other destinations, and one is appropriated to the *Institution du Père Eternel*, which, besides boarding and educating 60 poor girls, has a great many out-patients receiving medical instruction. The edifice, now the theatre, has served at different periods for the meetings of the states of Brittany, and the parliament of Rennes. Vannes has 3 hospitals, a communal college, school of navigation, a Polytechnic society, established in 1829, for the culture of the arts and sciences, a public library of 8,000 vols., and manufactures of coarse cloths, linen and cotton yarn, and lace. Its port is small, and the entrance being shallow, it is fit only for vessels of small burden; on one of its sides is a planted promenade, and on the other are slips for building boats and small craft. It has been supposed that Vannes occupies the site of *Dariorigum*, the cap. of the Veneti; but the better opinion seems to be that the latter was about 5 m. N. by W. Vannes, at Locmariaquer, where the remains of a circus and Roman road are still extant. (*Hugo, art. Morbihan; D'Anville, Notice de L'Anecdote Gaule*, p. 262; *Martinique, &c.*)

VAR, a maritime dep. of France, reg. S.E., between lat. 43° and 44° N., and long. 5° 40' and 7° 15' E.; having N.W. the dep. Bonches-du-Rhône, N. the Basses-Alpes, N.E. the Sardinian States, (co. Nice), from which it is separated by the river Var, and E. and S. the Mediterranean. Area, 726,896 hectares. Pop., in 1-36, 321,686. The surface, particularly in the N. and E., is mostly covered with ramifications of the Alps, consisting of primitive or calcareous formations covered with a gravelly and arid soil. The dep. is, however, well watered, and on the banks of some of the rivers, as the Var and Argens, are some very fertile tracts. The Var, whence the dep. derives its name, rises in the dep. of the Basses-Alpes, about 6 m. S.E. Colmar, and after running generally southward, falls into the Mediterranean at St. Laurent, 31 m. S.W. Nice, after a course of 64 m., for about half of which it is navigable for rafts. The Esteron and Vesoulba are its chief tributaries; no towns of much consideration are on its banks. Numerous lagoons and marshes border the coast of this dep., which is generally abrupt, rocky, and indented with numerous inlets. In 1834, the arable lands were estimated to comprise 118,052 hectares; vineyards, 67,557 do.; woods, 230,700 do.; and wastes, about 187,900 do. Agriculture is very backward, and the supply of corn is inadequate for the consumption of half the pop.; the produce in wine, olives, and fruits of various kinds is, however, considerable; and 115,494 kilogs. of silk were gathered in 1835. Capers, oranges, lemons, cherries, and peaches are among the principal exotics. Grapes are especially famous for its essences and liquors; and roses, jasmines, &c., are grown there and elsewhere in large quantities for their manufacture. The forests comprise many cork-trees, and bottle corks are made in several places. Kermes and a little tobacco are among the other products. Few horses or cattle, but a good many mules, are bred. In 1830, there were estimated to be upwards of 270,000 sheep, and 18,000 goats, in the dep., and the woods afford nourishment for numerous hogs. In 1835, of 102,660 properties subject to the *contrib. foncière*, 42,012 were assessed at less than 5 fr., and 21,790 at from 5 to 10 fr., only 27 were assessed at 1,000 fr. and upwards. Lead, coal, copper, iron, manganese, &c., are met with, though very few mines are wrought. The tunny and anchovy fisheries are of considerable importance, and considerable good quality is fished up on the coast. Manufactures of no great consequence; but silk twist, perfumery, soap, paper, and leather are produced to some

extent; the dep. has, however, a considerable trade with the Sardinian States, &c. It is divided into 4 arrondis, chief towns, Draguignan, the cap., Toulon, Brignolles, and Grasse. It sends 5 mems. to the Ch. of Dep. Registered electors, in 1838-9, 1,765. Total public revenue, in 1831, 9,210,227 fr. (*Hugo, art. Var; Dict. Geog.; French Official Tables*.)

VARINAS, a town of Colombia, repub. Venezuela, cap. prov., on a tributary of the Apure, 300 m. S.W. Caracas. Pop. uncertain, being variously estimated at from 6500 to 12,000. It is rather handsome, but has no public buildings worth notice. It is the principal mart for the excellent tobacco grown in its prov.; but has also a considerable trade in sugar, coffee, cotton, indigo, and cattle, which are mostly exported by way of the Apure and Orinoco. (*Codazzi; Geog. de Venezuela, &c.*)

VARNA, a fortified town and seaport of European Turkey, prov. Bulgaria, on the Black Sea, at the mouth of the Pravadi, 47 m. E. Schumla; lat. 43° 12' N., long. 27° 54' E. Pop. estimated at about 16,000. Though the residence of a pacha, it is a poor town, and has only an open roadstead; but the latter, being sheltered from N.W. winds, which are the most to be feared in this sea, and the holding ground being good, it presents but little danger; and Varna is a principal *dépôt* for the export of Bulgarian produce to Constantinople. The town fell into the hands of the Russians in 1829, in consequence, as is supposed, of their having bribed the governor. (See *Keppel's Journey across the Balkan*, i. 358, 359.) Agreeably to the treaty of Adrianople, its fortifications were dismantled, but they are said to have been since replaced by new defensive works. (*Dict. Geog.; Stein; &c.*)

A great battle was fought near Varna on the 10th of Nov. 1441, between the Hungarians and their allies, under their king Ladislaus, assisted by the famous John Hunyadi, and the Turks, under their sultan, Amurat II. The Christians, who had broken a truce which they had a short while before solemnly sworn to observe, suffered severely for their perfidy; their king having been killed in the battle, Hunyadi taken prisoner, and their army totally defeated with a prodigious slaughter. (*L'Art de Vérifier les Dates*, 2e partie, v. 250, 8vo. ed.)

VASTO (an. *Histonium*), a town and sea-port of the Neapolitan Dom., prov. Abruzzo-Citra, on the Adriatic, 31 m. S.E. Chieti. Pop., in 1830, 9,016. It is walled, and has some collegiate churches, one of which is said to occupy the site of a temple of Ceres, several convents, hospitals, &c., with many good private buildings. Its hills are mostly occupied in the manufacture of earthenware, in fishing, and the cultivation of olives and vines. On the 1st of April, 1816, this town was the theatre of an extraordinary catastrophe, by which it was partially destroyed by a sudden falling in and sliding of the soil, supposed to have been occasioned by the escape of subterranean water. (*Det. Rel. Descrizione delle Due Sicilie*, ii. 410.)

VAUCLUSE, a dep. of France, reg. S.E., between lat. 43° 40' and 44° 25' N., and long. 4° 40' and 5° 13' E., having N. the dep. Drome, E. Basses-Alpes, S. Bonches-du-Rhône, from which it is separated by the Durance, and W. the Rhône, separating it from Gard. Area, 347,577 hectares. Pop., in 1830, 230,113. The general slope of this dep. is to the W., in which direction it is traversed by many small tributaries of the Rhône. Soil, mostly calcareous, but it is only in the neighbourhood of the larger rivers that it possesses much fertility. In 1834, the arable lands were estimated to comprise 157,734 hectares; vineyards, 28,594 do.; woods, 62,141 do.; willow plantations, &c., 2,717 do.; and heaths, wastes, &c., 67,760 do. In 1835, of 81,140 properties subject to the *contrib. foncière*, 28,304 were assessed at less than 5 fr., and only 22 at 1,000 fr. and upwards. Agriculture, though still very backward, is said, of late years, to have made considerable progress. Oxen, horses, or mules are used indifferently for the plough; but the last are principally employed. The scarcity of other manure obliges the farmers to cut the wild box on the hills, which, being macerated and suffered to rot, is used for the purpose, and found peculiarly suitable for manuring vines. Wine and silk are among the most important products of the dep.; the produce of wine may, perhaps, be estimated at about 500,000 hectolitres, of which a considerable portion is exported. The best wines are those of *Coteau-haut*, near Avignon, and of *Châteaufort*, 41 leagues from Orange. Speaking generally, however, too little attention is paid to the culture and care of the vine. *On en comptait* says Julien, *beaucoup plus de bons vins, et les propriétés appartenant plus de vin dans le che de la plante, et dans la culture.* (p. 204.) In 1835, upwards of 1,600,000 kilogr. of raw silk were gathered. The produce of wheat is insufficient for home consumption, but a good deal of rye, and some maize, barley, buckwheat, potatoes, &c., are grown, besides saffron, madder, and cork-trees, &c. Almonds and other fruits, and anders and silks seeds. Almonds and other fruits, and essence of lavender are among the exports. Artificial grasses are sown; but the pasture lands are not extensive, and the quantity of stock is less than in any other

of the S. depts. Bees are pretty numerous; the honey is of good quality; and about 60,000 kilogr. of wax are supposed to be exported annually. This dep. does not appear to be rich in metals; but bulking stone, of good quality, lime, potters' clay, &c. are plentiful. Silk factories are made at Avignon and Orange; and the town of Apt is famous, in the S. of France, for its earthenware and confectionery, as is Avignon for its printing establishments, and manufactures of printing types, bells, and other metallic goods. Copper, lead, and iron cordage, linen thread, glass wares, and tiles are made in this dep., which has also many distilleries and dyeing-houses. Vaucluse is subdivided into 4 arrondis.: chief towns, Avignon, the cap., Apt, Carpentras, and Orange. It sends 4 mems. to the Chamber of Deputies. Registered electors, in 1838-39, 1,232. Total public revenue (1831), 5,482,148 fr. (*Hugo, art. Vaucluse; Dict. Géog.; French Official Tables.*)

VAUCLUSE, a famous fountain in the above dep., close by the small village of the same name, 4 m. W. Isle, and 15 m. W. by N. Apt. This fountain has its source in a vast cavern at the foot of a rock 300 feet in height at the bottom of a narrow gorge in the mountains. Within this cavern is a deep basin of the purest water, the surface of which appears to be perfectly smooth and placid, but which, notwithstanding, emits so great a quantity of water as to give birth to the small river Sorgues, an affluent of the Rhone. After the melting of snows, or the occurrence of long-continued rains, the flow of water is greatly increased; but even in the driest seasons it is astonishingly copious. In ordinary states of the fountain the water escapes by percolating through the rocks, stones, and gravel, that form the outward side of the abyss; whereas during floods it overflows its banks. It is possible, taking proper precautions, to descend, when the water is low, to its edge. Owing to its great depth it appears as if it were jet black, though, as already stated, it is limpid in the extreme.

This fountain is celebrated in the history of Petrarch. An old castle near the village, which belonged to his friend the Bishop of Cavillon, was frequently visited by Petrarch, and is thence called his castle. The poet, however, lived in the village. He here frequently saw Laura, who is generally supposed to have been the wife of the Count de la Sade, the lord of the village. But this is doubtful, as well as the Platonism of her lover. (*Hugo, art. Vaucluse, &c.*)

VAUD (Fr. *Pays de Vaud*, Germ. *Waadt*), a canton of Switzerland, holding the 19th rank in the confed., between lat. 46° and 47° N., and long. 6° and 7° 12' E., having N. the cant. and lake of Neuchâtel, E. Friburg and the Bernese Oberland, S. the Valais, Savoy, and the lake and territory of Geneva, and W. the dep. of Jura in France. Area, about 1,180 sq. m. Pop., in 1837, 180,582; all Protestants, except about 3,000 Rom. Catholics. Both the S.E. and N.W. extremities of this canton are mountainous; the former quarter is covered by ramifications of the Alps, one summit of which, the Diablerets, rises to 11,120 ft. above the level of the sea; the latter region is traversed by ranges of the Jura. The middle of the canton, between the Jura mountains and the lakes of Geneva and Neuchâtel, is a rich undulating country, and so celebrated for its agreeable character and picturesque beauty, that it has long been resorted to by visitors from many parts of Europe; in 1837, 14,500 of its inhabs. were citizens of other cantons, and nearly 4,000 foreigners! The raising of corn and wine is the chief occupation of the pop. The vineyards, reckoned the best in Switzerland, are supposed to comprise about 13,000 acres, and to employ 20,000 vine-dressers, independently of women and children. The wines of La Vaux and La Côte, both grown on the shores of Lake Lemán, are the best: the first is produced near Vevey, where the Romans, who erected a temple to Bacchus at Cully, are supposed to have originally planted the vine. A society of high antiquity in that town exercises a survey of the vineyards in the district, and celebrates a remarkable fête, attended by a great concourse of strangers, every 15th or 20th year. The number of cattle in Vaud has of late increased very much; in 1830, it was supposed to have about 75,000 head of cattle, 33,500 horses, and 77,000 sheep; and the improvement in the breed is said to have kept pace with the increase of numbers. Almost the only salt springs in Switzerland exist at Bex in this cant. They were discovered in the 16th, and bought by the government of Bern in the succeeding century; in 1834, they produced a revenue of 18,439 s.w. francs. Marble, coal, crystal, sulphur, petroleum, and a few metallic products, are met with, though not raised in any large quantities. Manufactures are very unimportant, and mostly confined to those of leather and yarn. The transit trade from France into Switzerland and Germany is of more consequence to the inhabs.

Vaud is subdivided into 19 districts and 60 circles; all

the towns of more than 3,000 inhabs. forming a separate circle. Its constitution is more aristocratic than that of most of the other Swiss cantons.

The legislative power is vested in a *grand conseil* of 184 mems. elected for 5 years, which meets yearly in May at Lausanne. The electors include a certain portion of those among the citizens who are taxed to the highest amount (*du nombre des trois quarts des citoyens le plus imposés à l'impôt foncier*), and must be neither domestic servants, recipients of public relief, bankrupt, nor under penal condemnation. Each circle sends 1 deputy to the grand council, who must be an inhab. of the circle, 30 years of age, and possesses property in the canton of the value of 2,500 fr., or some equivalent thereof; the town of Lausanne sends 4 deputies; 4 candidates are also nominated by each of the circles, and from among the general list the mems. already chosen elect 63 other mems. Finally, an electoral commission, composed of the mems. of the executive body, of the court of appeal, and 40 mems. of the legislative council, chooses the remaining mems., electing 36 from among the cantonal citizens 40 years of age and possessors of landed property to the value of 10,000 fr., and 18 above 25 years of age without property qualification. (*Picot.*) The legislature chooses the executive council, which consists of 9 mems., and has the initiative in all propositions of laws and taxation. Each district has a court of primary jurisdiction, and each circle a justice of the peace. The inhabs. understand and speak French; but their common *patois* is a dialect somewhat similar to the Romanche. Schools are pretty general, and in 1834 it was estimated that 1 in 6 of the pop. was receiving public instruction. Public revenue, in 1834, 1,276,377 fr.; expenditure, 1,115,665 do.

This territory nearly corresponds to the *Pagus Urbinus* of Caesar. It successively belonged to the Burgundian and Frankish kingdoms, the Germanic Empire, and the dukes of Zähringen. From 1273 to 1536 it was possessed by Savoy; and by the gov. of Bern from the latter year till 1798, when it was erected into the canton of Lemán. It reassumed its present name in 1803. It furnishes 2,564 men to the army, and 59,273 fr. a year to the treasury of the Swiss Confederacy. (*Picot, Statist. de la Suisse; Ebel; Bowering's Rep. on Switzerland.*)

VELEZ-MÁLAGA (an. *Menola*), a town of Spain, in Andalusia, prov. Málaga, cap. dist. on the Velez, near its mouth, and 14 m. E.N.E. Málaga. Pop., with its vicinity, according to Mitano, about 14,000. The town is slightly elevated above and on the left bank of the stream, and is commanded by the neighbouring hills. The streets are wide, clean, and well paved; but the thriving commerce, and abundant market naturally looked for in a place once so noted for the productivity of its orchards and extent of its export trade, are no longer to be seen. (*Scott's Ronda and Granada*, i. 219.) Under the Moors, Velez was a place of considerable strength, and had a castle, now in ruins. It has two par. churches, six convents, several workhouses, a prison, public granary, &c., and some fine public promenades. It is said to be peculiarly well situated; its climate is not oppressively hot; the town being sheltered by the neighbouring heights; and its neighbourhood is very fertile, producing sugar, coffee, cotton, cochineal, large quantities of wine, silk, various fruits, the sweet potato, &c. It has some sugar-mills, and manufactures of hats, soap, brandy, &c. It was taken from the Moors in 1487, the siege having been conducted by Ferdinand in person. (*Mihano; Tournesand; Scott; &c.*)

VELLETRI (an. *Veltivæ*), a town of S. Italy, Papal States, Comarca di Roma, near the Appian Way, 20 m. S.E. Rome. Pop. about 10,000. It stands on a commanding eminence at the foot of Mount Armetisio, and enjoys an extensive view of the Pontine Marshes, as far as Monte Circello, and of the sea, with the range of the mountains of Norba, Cora, and Segni, and even those beyond Palestrina. It is surrounded by ruined walls, with decayed towers, and ruinous castles, and is built indifferently built. It has a town-hall by Bramante, and some fine palaces. The principal square has a fine fountain, and a bronze statue of Pope Clement VIII. The Burgian Museum, now in Naples, was originally established in the Rorgian palace, in this town. The inhabs. are mostly peasants, who work in the neighbouring fields and vineyards, and at night retire to the town, the air of which is extremely good. According to Stroud, the inhabs. are "not quite so ragged as their neighbours, although the place is full of dirty, and the inn as miserable." *Veltivæ* appears to have been one of the most considerable cities of the Volsci, and is said by Dionysius to have been fortified by Coriolanus. It was the residence of the Octavian family before they settled in Rome; and is celebrated as the birth-place of Augustus, who was born here on the 23d Sept., anno 63 B.C., in the consulship of Cicero. (*Rampoldi; Gell's Topography of Rome, &c.*, ii. 340, &c.)

**VELLORE**, a town and fortress of British India, presid. Madras, distr. Arcot, 80 m. W. by S. Madras. The fortress, which is of considerable extent, comprises spacious barracks and the other necessary accommodations for a garrison, with various handsome buildings round a square, on one side of which is a curious pagoda, now used as a magazine. The native town, which is also large and populous, is situated to the S. of the fort, with which it is connected by additional battlements. In 1677 it was taken by Sevajee; and, during the war of 1782, was relieved by Sir Eyre Coote, in the face of Hyder's army. After the capture of Seringapatam, Tipoo's family was removed to Vellore, in 1806 a formidable revolt of the native troops, followed by a massacre of the Europeans, took place here, of which Tipoo's family were supposed to have been the instigators. This occasioned the removal of the latter to Calcutta. (*Hamilton's E. I. Gazetteer*.)

**VENDEE (LA)**, a maritime dep. of France, reg. W., formerly included in the prov. of Poitou, and, exclusive of the islands Ileu and Noirmoutiers, extending between the 46th and 47th degrees of N. lat., long. 0° 35' and 2° 10' W.; having N., Loire-Inférieure and Maine-et-Loire; E., Deux-Sèvres; S., Charente-Inférieure; and S.W. and W., the Atlantic. Area, 781,700 hectares. Pop., in 1836, 330,350. No portion of the surface is much elevated; the E. part of the dep. is undulating, though nowhere rising to the height of 500 ft. The principal rivers are the Sèvre-Nantaise and Niortaise. Antise, Vendée, Lay, Yeu, and Vie. The Vendée rises in the dep. Deux-Sèvres, runs generally in a S.W. direction, and joins the Sèvre-Niortaise, after a course of about 16 leagues, only a small portion of which is navigable. Fontenay is the only town of consequence on its banks. The dep. is subdivided into 3 districts; the marshes, the plain country, and the *bocage*. The marshes extend principally along the coast; the *bocage*, so called from the wood sprinkled over it, occupies the centre and upper parts of La Vendée; and the plain country, a great part of which is very fertile, comprises the rest of the surface. In 1834, the arable lands were estimated to comprise 408,563 hectares; pastures, 108,836 do.; vineyards, 17,700 do.; and woods, 29,600 do. Agriculture is conducted in much the same way as in the adjacent dep. of Loire-Inférieure (which see). Leases run from 3 to 7 years. Few of the farms are let for money; but the rent, paid in produce, may be equivalent for corn land to 26 fr.; for vineyards, 24 fr.; and for meadow lands, 40 fr. an acre. In the plains the ground is left idle the second year, as in Loire-Inférieure.

"The whole of this dep., as well as that of the Loire-Inférieure is, with a very few exceptions, most miserably farmed. The farmers are without capital, and badly provided with implements, and have not half the number of labourers required for the land; the fields are always full of weeds, for the roots are left entire by the bad ploughs in use, and from the want of hands to pluck them out." (*Part. Rep. on Agriculture*, 1834.) A greater quantity of wheat is grown than in any other of the W. depts., and, next to it, barley is the grain principally cultivated. Flax and hemp are grown to a considerable extent in the marshy tracts. A large quantity of wine, principally white, is produced; but, according to Jullien, it is *d'une qualité très-médiocre, et en général vert, plat et sujet à tourner à la graisse dès la première année*. (P. 147.) This inferiority is ascribed to the circumstance of the cultivators being more anxious to increase the quantity than to improve the quality of their wines. Throughout a great part of the dep., estates are usually divided into farms of from 45 to 90 acres; and in the plain country few farms of this size have fewer than 60 or 80 sheep. The annual produce of wool is estimated by Hugo at 600,000 kilogr. Oxen are sold from the plain to the bocage farmers, who fatten a good deal of stock. In some places mules are used for ploughing; they are brought from Deux-Sèvres when young, and after having been worked lightly for 4 or 5 years, are sold to merchants for the Spanish market. (*Rep. on Agric.*) In 1835, of 124,113 properties subject to the *contrib. foncière*, 69,644 were assessed at less than 5 fr., and 17,027 at from 5 to 10 fr. (*Official Tables*.) A little lead and antimony, with some iron and coal, are obtained; but the dep. is not rich in mineral products. Pishards are taken on the coast, and the inhabs. of Sables d'Olonne are interested in the Newfoundland fishery. Manufacturers few; being principally of hats and woollen stuffs, for home consumption. La Vendée is divided into 3 arrondis.; chief towns, Bourbon Vendée, Fontenay, and Sables d'Olonne. It sends 5 mems. to the Ch. of Dep. Reg. electors in 1838-39, 1,477. Total public revenue, in 1831, 6,671,303 fr. This dep. is distinguished for the chivalrous and obstinate stand made by its inhabitants during the progress of the French revolution, in favour of the rights or pretensions of the Bourbons. In this, no doubt, they were a good deal assisted by the nature of the country; but their gallantry and their sacrifices were alike remarkable, and were worthy of a better cause.

(*Hugo, art. La Vendée; Dict. Géog.; French Official Tables*.)

**VENDOME**, a town of France, dép. Loir-et-Cher, cap. arrond.; on the Loir, 20 m. N.W. Blois. Pop., in 1836, ex. comm., 7,030. It is well built, clean, and handsome. The remains of an ancient castle, the communal college, cavalry barracks, theatre, and public library, are the objects most worthy notice. It has manufactures of kid gloves, cotton cloths, hosiery, yarn, paper, and leather.

**VENEZUELA, see COLOMBIA.**

**VENICE** (Ital. *Venezia*), a famous maritime city of Austrian Italy, formerly the cap. of the republic of the same name, and now of E. Lombardy, on a cluster of numerous small islands, in a shallow, but extensive lagoon, about 4 m. from the mainland, in the N.W. portion of the Adriatic, 75 m. W. by S. Trieste; lat. 45° 29' 53" N., long. 12° 20' 31" E. Pop., in 1837, 97,156. The appearance of Venice, from whatever side she may be approached, is striking and singular in the extreme. Owing to the lowness of the islands on which she is built, she seems to float upon the sea,

— "from out the wave her structure rose,  
As from the stroke of the enchanter's wand."

She is divided into two principal portions, of nearly equal size, by the Grand Canal (*Il Canale Maggiore*), a serpentine channel, varying from about 100 to 180 ft. in width, crossed by the principal bridge of the city, the celebrated *Rialto*. The various islands, which form the foundations of these two grand divisions, are connected by numerous bridges, which, being very steep, and intended only for foot-passengers, are cut into steps on either side. The canals, or *riti*, crossed by these bridges, intersect every part of the town, and form the "water-streets" of Venice; by far the greater part of the intercourse of the city being carried on by their means in gondolas or barges.

But, besides the canals, Venice is everywhere traversed by streets, or rather passages (*calli*), bearing a striking resemblance to Cranbourn Alley; and so very narrow, as to be in general only 4, and seldom more than 5 or 6 ft. in width. The only exception is the *Merceria*, a street in the centre of the city, lined on each side with handsome shops; but even this, which may be regarded as the Portland Place, or Regent Street of Venice, is only from 12 to 20 ft. across! To ride in a carriage, or on horseback, is here wholly out of the question. The streets, or lanes, are consequently not paved with round stones, or blocks, but with flags, or marble slabs, having small sewers for carrying off the filth. Almost all the principal houses have on one side a canal, and on the other a lane, or *cale*. The former, however, is the grand thoroughfare; and gondolas, or canal-boats, are here the universal substitute for carriages and horses. They are generally long, narrow, light vessels, and, though rowed only by a single gondolier with one oar, cut their way through the water with extraordinary velocity. A statutory law of the old regime directed that the gondolas should all be painted black. In the middle is an apartment fitted with glass windows, blinds, cushions, &c., for the accommodation of 4 persons. Some of the gondolas, belonging to private families, are magnificently fitted up. The charge for a gondola is about 10d. an hour; and with it you may soon visit every part of the city.

In many parts there are small squares, or *campi*, in which are usually cisterns, for the careful preservation of rain water; but the only open space of any magnitude is the piazza of St. Mark, with the piazzette leading to it, and forming the state entrance to Venice from the sea. "The piazzetta is at right angles with the great square, branching off in a line with the church of St. Mark. On one side, and turning a side front to the port, is the old palace of the doges; on the other side are the *zecca* or mint, and the library of St. Mark, the regular architecture, and fresh and modern appearance of which seem to mock the fallen majesty of their antique neighbours. On the sea shore, which forms the 4th side of the piazzetta, stand two magnificent granite columns, each of a single block; one crowned with the winged lion of St. Theodore, in bronze, and the other bearing the statue of St. Theodore. Between these two columns, in former times, public executions took place." (*Conder's Italy*.) The piazza of St. Mark is an oblong area, about 860 ft. by 350, flanked over. Two of its sides consist of regular buildings with deep arcades. Each side is itself uniform, though not similar to the other. On the N. is the *Procuratie Vecchie*; on the S., the *Procuratie Nuove*. The W. side was formerly occupied by the church of St. Geminiano; but this was taken down by the new Imperial who erected in its stead the staircase of the cathedral of St. palace. At the opposite end are the cathedral of St. Mark, the Orologio, and the Campanile; and in front of the cathedral are 3 tall poles, supported on handsome bases of bronze, whence the flags of the Morea, Crete, and Cyprus were formerly displayed. From being the

only piece of open ground in Venice of any consequence, this square is almost constantly thronged with company, and it is the scene of all the public masquerades, festivals, &c., that take place in the city.

Venice has a vast number of fine private palaces by Sansovino, Palladio &c.; but many of its public buildings are more remarkable for gorgeousness and display, than for purity and taste. They present generally a heterogeneous intermixture of Byzantine, or other Eastern, with Greek, Roman, and Gothic architecture. The celebrated church of St. Mark is not Gothic, Saracenic, or Roman, but a mixture of all those styles; neither a church nor a mosque, but something between the two; too low for grandeur, too heavy for beauty, no just proportion being preserved among the different parts. Yet it has the effect of grandeur, and a sort of beauty, from the richness of the materials, and the profusion of ornament. The original church was founded in 823; but the present edifice was founded in 977, under the direction of architects from Constantinople. The nave is 245 ft. in length, the transept 201 ft.; the middle dome is internally 90 ft. in height, and the 40 other domes 80 ft. each. The front is 170 ft. in width, and 72 ft. in height, without its surmounting figures. In its lower part are 5 recessed doorways, each adorned with 2 stories of little columns, though these are mostly ill proportioned, and their capitals nearly all different. Over these arches is a gallery or balcony of marble, in the centre of which are the famous bronze horses, most probably of Chian origin, and carried to Constantinople by Theodosius, whence they were conveyed away by the Venetians, when they took and plundered the capital of the eastern empire, in 1206. For 18 years, or from 1797 to 1815, they crowned the triumphal arch in the *Place du Carrousel* in Paris; but, though restored, we may well inquire,

— "Is not Doria's menace come to pass?"

Are they not *brillat*?

(*Child Harold*, cant. iv. st. 13. and note.)

Immediately behind the horses is a large circular window, on either side of which an arched doorway opens upon the balcony. The front terminates in pointed arches, surmounted by a crowd of spires, pinnacles, statues, crosses, &c. The finishings are in the style of the Italian Gothic of the 16th century, but overcharged and heavy. Forsyth, speaking of this edifice says, "No where have I seen so many columns crowded into so small a space. Nearly 300 are stuck on the pillars of the front, and 300 more on the balustrade above. A like profusion prevails in the interior, which is heavy, dark, and barbarous." But, from Mr. Wood's account, it would appear that the same barbarous taste that prevails in the exterior, is not so obtrusive within. "The vaulting and great part of the walls are covered with mosaics, and the rest with rich marbles. The columns of porphyry, verd-antique, &c.; the pavement of minute pieces of white and coloured marbles, jasper, agate, lapis lazuli, &c., variously, and for the most part, beautifully disposed; the inlaid ornaments, and gilded capitals, produce a degree of astonishment and admiration in the mind of the spectator." (*Letters of an Architect*, i. 260.)

The Orologio, or clock-tower, on the N. side of the cathedral, has little to recommend it; and the campanile is merely a large square tower upwards of 300 ft. in height, terminated by a pyramid. In it, however, Galileo made many of his astronomical observations. The *loggia* around its base, now converted into a lottery-office, is a beautiful building of the Corinthian order, from the designs of Sansovino. The *Procuratorie Nuove*, now the royal palace, is a rich line of building, fronted with all the different Greek orders.

The ducal palace was originally founded in the 9th century, but the present edifice dates only from the middle of the 14th, when it was erected by the doge Marbo Faliero. Externally, it presents a double range of arches, supporting a great wall of brickwork, pierced with a few windows. The corners are cut to admit thin spiral columns. Notwithstanding its many defects, this structure derives an imposing effect from its grandeur of dimensions, and unity of design. The palace is entered by 8 gates, the principal leading into the *cortile*, which is surrounded on 3 sides by 2 stories of arcades. One side is richly ornamented, though the whole has a bad taste. A noble flight of steps, called from the colossal statues of Mars and Neptune, by Sansovino, the *Giant's Staircase*, leads up from the *cortile* to the open arcade, where, under the Republic, the lions' mouths gaped to receive communications or surmises of plots against the state! From this exterior corridor the state apartments are entered. The walls of the *Sala di Quattro Porte* are covered with paintings by Tintoretto, Vicentino, and Titian. The hall of the Great Council, *Sala del Gran Consiglio*, 183 ft. in length, is now principally appropriated to the library, of which Petrarch was one of the founders; but it is also rich in frescoes, by Bassano, &c., and contains a fine collection of ancient sculpture, the portraits of the Venetian doges, &c. The *Sala dei Pro-*

*gadi*, and numerous other apartments, are richly gilt, and exhibit all the glories of the Venetian school of painting, "which spreads over the walls and covers the ceilings, as if it had only cost a few shillings the sq. yard." In the hall of the Council of Ten, converted by Napoleon into the chamber of a court of cassation, the ceilings have been painted by Paul Veronese; and on every side the eye rests on pictorial representations of the achievements and glories of the Republic. In the lower parts of the palace are the former tribunals and dungeons of the state institution, from which a passage leads across the *Ponte de Sospiri*, or Bridge of Sighs, to a door now walled up, but which formerly opened into a chamber where prisoners were despatched.

Next to the buildings in the neighbourhood of St. Mark's, those bordering the harbour and the canal of Giudecca appear to be the finest, including the Dogana or custom-house, the church of La Salute, and those of San Giorgio and Il Redemptore, both designed by Palladio. These last were on the point of being pulled down by the French, and only saved by being redeemed for a large sum of money. The Redemptore, Forsyth says, is admirable both in plan and elevation, and its interior is perhaps perfect in its proportions, simple, grand, and harmonious. It is, in fact, one of Palladio's *chef d'œuvres*, and is perhaps the finest church in Italy, though inferior to a great many in costliness and magnitude. Besides a Greek church and 7 synagogues, Venice has altogether about 100 Rom. Cath. churches, which are, on the whole, among its best buildings. There were formerly many more; but the French pulled them down, with a number of convents, in pursuance of their plans for the improvement of the city. Several of the churches date from the middle ages, though few of them are worth special notice. One, however, is interesting, from its containing the remains of one of the greatest painters and of one of the greatest sculptors that Italy has produced—Titian and Canova; the grave of the former is marked by a short inscription on a plain stone let into the pavement. Canova has a fine pyramidal monument, from one of his own designs, the expense of which was defrayed by contributions collected in all parts of Europe. The famous painter, Paul Veronese, is buried in the church of St. Sebastian, where he has a monument. The boffices of all the churches are detached, and appear to be built on the model of St. Mark's.

The general cemetery or burying-place for the city is on the island of San Cristoforo di Murano. Here, rich and poor, the noble and the beggar, are all interred, the expenses of the burial of the latter being defrayed by government. This cemetery was formed, and the plan of conveying all dead bodies to it from the city enforced, by the French; and, happily, it has since been continued. A gondola, moored to the island, is appropriated to the transmission of corpses. The Jews have their burying-ground at Malomocco.

For a lengthened period after the foundation of the city, the communication between its E. and W. divisions, across the grand canal, was effected by ferry-boats. A wooden bridge was subsequently established; and this having fallen to decay, it was determined to replace it by one of marble from the designs of Antonio da Ponte. The building of the Rialto was commenced in 1591, but, though it consists of a fine elliptic arch, neither its beauty nor its magnitude corresponds with its fame and the attention it has excited. Its arch is 89 ft. in span. The roadway of the bridge is divided into three parts, viz. a narrow street in the middle, with shops on each side, and two still narrower streets between the shops and the balustrades. The shops disfigure the bridge, and make it look heavy. It is lofty in the middle, and is ascended, like the other bridges, by long flights of steps at either end. The view from the summit, along the grand canal, frequently presents a very animated scene, and is one of the finest in Venice.

The palaces of Venice, built, like those of Amsterdam, on piles, are massive structures; but, except such as have been built by Palladio, Sansovino, Scamozzi, Longhena, Scamozzi, and a few other architects of eminence, they are mostly deficient in good taste. They in general exhibit too many orders in front. Venice, in truth, is more attractive from its singularities than its architectural elegance. Yet it is still highly interesting to the student of architecture, who may here "trace the gradation from the solid masses and round arches, the only remains of the ancient grand style in the 6th, 7th, 8th, and 9th centuries, through the fanciful forms and grotesque embellishments of the middle ages, to its revival and re-establishment in later times." (*Eustace, Classical Tour*, i. 167.) Many, however, of the old patrician mansions are deserted, and not a few of them have been pulled down. Necessity, too, has, in many instances, obliged their owners to part with the fine works of art, with which they were formerly embellished. Still, however, some of the palaces have yet to boast of good collections of pictures, statues, &c. The Manfrin palace has a splendid gallery of pictures; and

the Palazzo Barberigo has some fine works by Titian. The Grimani palace contains the only extant statue of Marcus Agrippa, a fine bust of Caracalla, &c.; and in the Pisani palace is Dedaalus fixing wings on his son, the first group executed by Canova.

But, notwithstanding their magnitude and imposing external appearance, the rooms inhabited by the family, in the greater number of the palaces which are still occupied, are often small, ill furnished, and uncomfortable. Personal accommodation and the enjoyment of good air have been sacrificed that space might be found for the exhibition of statues, pictures, and other works of art. All the larger houses, or palazzi, are from three to four stories in height, being generally of a square form, with an inside court containing a cistern, in which the rain-water is carefully collected. As already stated, they have, for the most part, two entrances—the principal opening on a canal, and the other on a street or alley. Some of the finest palaces are built wholly of marble. The grand canal has on each side many such buildings.

The houses occupied by the middle and lower classes are built of brick, and are in general covered with wood. Few of them have arcades, but they are mostly provided with balconies. From the extreme narrowness of the streets, the houses are usually gloomy; and are miserably deficient in the appropriate distribution of their different parts, and in all the conveniences and adaptation to comfort that distinguish houses in this country.

The arsenal, which opens upon the port not far from St. Mark's, together with the dockyard, occupies an island between two and three m. in circuit, and is defended by lofty turreted walls. The entrance is guarded by two towers flanking a gateway, over which the winged lion still frowns defiance; and in front of this entrance are four lions, brought from the Piræus: two being of very fine proportions, and probably of Pentelie marble. The magazines and docks are kept in good order, and ship-building is one of the chief branches of industry at Venice. Besides the armoury, magazines, forges, foundries, and other necessary establishments, here is a row-house, 1,640 ft. in length. One of the walls of the armoury has a statue of Pisani, famous for his contests with the Geopoles, and a beautiful monument by Canova, representing Fame crowning the Venetian admiral, Angelo Emo.

During the times of the republic, the Bucentaur was the great lion of the arsenal. This was the state barge, in which the doge, accompanied by a splendid cortege, proceeded to espouse the Adriatic. The ceremony was performed by the doge dropping a ring of no great value into the sea, pronouncing at the same time the words, *Deponamus te, Mare, in signum terti perpetuæque dominii*. In these days, however,

"The spouseless Adriatic mourns her lord,  
And annual marriage now no more renewed."

Byron adds that the Bucentaur "lies rotting, unrestored;" but, in fact, she was burned by the French soon after the downfall of the republic.

Venice has 6 theatres, the largest of which may contain 2,500 spectators: the Venetian drama is, however, in a very low state. The Dogana, the old exchange, is a fantastic edifice of the 17th century; and the new prison, built by Antonio da Ponte in 1589, is much too handsome for its purpose, being an elegant Doric edifice. The bishop's palace and seminary, the various hospitals and barracks, are among the other principal edifices. A flourishing academy of the fine arts, 4 schools of music, and a public school for each corporation of tradesmen, are among the principal institutions for education.

Venice holds a prominent place in Italy for its charitable institutions. There is one house within the city in which 700 poor people are lodged, and many more have free lodgings and receive pecuniary assistance out of the establishment. There is an orphan house for about 335 children; an infirmary for 36 women; a wealthy institution for the reception of penitent women; an hospital, capable of receiving 1,000 patients; a house of education for 90 young girls; a foundling hospital, &c.; and the yearly revenues, chiefly arising from endowments, amount to about 590,000 florins." (*Von Hauner's Italy*, i. 86.)

Venice has been represented as a delightful residence; but though it may be, and perhaps is, an aquatic paradise to the amphibious bipeds born within the sound of St. Mark's bells, it is very different to a stranger. At first, no doubt, it surprises and gratifies by its novelty; but it soon becomes tiresome from its sameness, the incessant recourse to boats, the narrowness of the streets, the want of room, the absence of all rural beauty, and the constant sense of imprisonment. It would not, in fact, be habitable were the water fresh; but the saltiness of the water, and the flux and reflux of the tide, make it tolerably salubrious. The latter phenomena, however, which are at all times much less sensible in the Mediterranean than on the British shores, are in summer so inconsiderable, that the canals become stagnant, offensive, and unhealthy. The characteristics of the climate are, a sun-

mer much hotter than in England, accompanied with occasional visits of the *scirocco*; a winter, not of great length, but sharp, particularly during the prevalence on the N.W. wind, which blows across the interior of Switzerland and the Alps. Rains are frequent, particularly in spring; and there being no springs or wells, the inhabitants, as already stated, supply themselves with water collected in cisterns, from the tops of the houses.

It should, however, be observed, that the Venetians are no longer wholly without trees and flowers; very extensive gardens, with a fine street leading to them, were constructed by the French, and are a noble monument of their taste and munificence. "These gardens," says Mr. Pennington, "excite interest from the mode in which they were formed, more than from their beauty; not that they are deficient in taste or variety. They were formed with immense labour by the introduction of artificial earth, brought at an immense expense from *terrafirma*, and no expense was spared in their completion. There are several serpentine walks over mounds, many trees and shrubs thriving very fast; and all this, with the different views of the lagoon, the many islands interspersed, and Venice, make this promenade both agreeable and interesting. The gardens are nearly 2 m. round, and are connected by a handsome bridge." (*Tour*, ii. 225.)

*Port.*—The islands on which Venice is built lie within a line of long, low, narrow islands, running N. and S., and enclosing what is termed the lagoon, or shallows, that surround the city, and separate it from the main land. The principal entrance from the sea to the lagoon is at Malamocco, about 14 league S. from the city; but there are other, though less frequented, entrances, both to the S. and the N. of the latter. There is a bar outside Malamocco, on which there are not more than 10 feet at high water at spring tides; but there is a channel between the western point of the bar and the village of San Pietro, which has 16 feet water at springs, and 14 at neaps. Merchant vessels usually moor off the ducal palace; but sometimes they come into the grand canal which intersects the city, and sometimes they moor in the wider channel of the Giudecca. Vessels coming from the S. for the most part make Piræus or Rovigno on the coast of Istria, where they take on board pilots, who carry them to the bar opposite to Malamocco. On arriving at the bar, ships are conducted across it and into port by pilots, whose duty it is to meet them outside, or on the bar, and of whose services they must avail themselves.

The chain of low, narrow islands which bounds the lagoon on the side next the sea, being, in part, broken, the republic constructed, during last century, a mole several miles in length, to fill up the gaps in question, and protect the city and port from the storms and swell of the Adriatic. This vast work, formed of blocks of Istrian stone resembling marble, connects various little islands and towns, and is admirable alike for its magnitude, solidity, and utility. It bears the following inscription:—

*Ex sacra æstuaris, urbis et libertatis sedes, perpetuum conservetur, colossæa mole, ex solidis marmore coacta mare posuere curatores æquarum. Anno salutis, 1751: ab urbe condita, 1330.*

*Money.*—Formerly there were various methods of accounting here; but now accounts are kept in Austrian lire, divided into centesimi, or 100th parts. The lire is worth about 8d.

*Weights and Measures.*—The commercial weights are here, as at Genoa, of two sorts; the *peso sottile* and the *peso grosso*. The French kilogramme, called the *libra Italiana*, is also sometimes introduced. 100 lbs. *peso grosso* = 165 186 lbs. avoirdupois, and 100 lbs. *peso sottile* = 65 424 lbs. avoirdupois. The *moggio*, or measure for corn = 9 Winchester bushels. The measure for wine, anfora, contains 137 English wine gallons. The foot of Venice = 13 6/8 English inches.

The *Old Bank of Venice* was founded so far back as 1171, being the most ancient establishment of the kind in Europe. It was a bank of deposit; and such was the estimation in which it was held, that its paper continued to bear an agio as compared with coin down to 1797, when the bank fell with the government by which it had been guaranteed. At present there are no corporate banking establishments in the city; and no bank notes are in circulation. There are, however, several private banking houses, which buy, sell, and discount bills; and make advances on land and other securities. They are under no legal regulations of any sort, except formally declaring the amount of their capital to the authorities when they commence business. The legal and usual rate of interest and discount is 5 per cent. It is not the practice to allow interest on deposits. Bills on London are usually drawn at 3 months, and on Trieste at 1 month.

*Morals and Manners.*—Most travellers have been accustomed to represent Venice as distinguished by a peculiar profligacy of morals. It may be doubted, however, whether she be entitled to any peculiar pre-eminence in this respect over most of the other great cities of Italy; and the loss of her commerce and of that wealth which the expenditure of government brought

into the city, has reduced alike the means of, and incentives to, corruption. It is now, we believe, pretty generally acknowledged that the impressions made on foreigners during the carnival season were in a great degree exaggerated; and that much of what they took for intrigue and profligacy, was no more than what the license of the period, and the universal use of masks, allowed even the most scrupulous persons to indulge in without any violation of propriety. Undoubtedly, however, the conduct of the government, the nature of her religion, and the vast wealth that formerly centred in Venice, all tended to corrupt the morals of the people and to immerse them in sensual pleasures. We hardly think it was ever, as Addison has stated, a part of the policy of government "to encourage idleness and luxury in the nobility, to cherish ignorance and licentiousness in the clergy, to keep alive a continual faction in the common people, to connive at the viciousness and debauchery of convents, to breed dissensions among the nobles of the terra-firma, and to treat a brave man with scorn and infamy." (*Travels*, art. *Venice*.) But, whether intended or not, this no doubt, was the effect of their jealous despotism, which, by its intolerance of all that was truly great, generous, and noble, shut up, in as far as possible, all the avenues to distinction in politics, literature, and even war, leaving little, save intrigue and licentiousness, to occupy the public mind. But, as already stated, society in Venice has been materially changed since the revolution of 1797. Lord Byron says, that "of the *gentiluomo Veneto*, the name is still known, and that is all. He is but the shadow of his former self, but he is polite and kind. It may surely be pardoned to him if he is querulous." But, notwithstanding the changes to which they have been subjected, and which have reduced them from haughty lords, but "one degree below kings," to abject subjects, the Venetians are now, as of old, most agreeable companions, and the Paphian Queen still holds her court in the sea-girt city.

"In Venice Tasso's echoes are no more,  
And silent rows the songless gondolier;  
Her palaces are crumbling to the shore,  
And music meets not always now the ear;  
Those days are gone — but Beauty still is here.  
States fall — art fade — but Nature doth not die;  
Not yet forget how Venice once was dear,  
The pleasant place of all festivity,  
The revel of the earth, the masque of Italy!"

Foreigners, especially, are extremely well received, and society is on a very easy footing in Venice. Owing to the facility with which the city is supplied with provisions from the interior of Lombardy and elsewhere, and the lowness of rents, living is here unusually cheap; and were it not for its disadvantages in other respects, it would be a very desirable residence.

The Government of Venice was one of the most singular that has ever existed. In her earlier period she appears to have been governed by doges, or princes, who were elected by the popular voice; but who, on being elected, became the absolute rulers of the state. The doge enjoyed, however, only a precarious dignity; for, in the event of any disaster occurring to the arms of the republic, or of his becoming unpopular, he was not unfrequently deposed, and sometimes assassinated. (*Daru*, i. 186, &c.) To obviate the disorders that grew out of this state of things, it was resolved, in the 12th century, that each of the six districts into which the city was then divided should nominate two individuals as electors, and that the twelve electors so chosen should nominate a grand council of 470 individuals which should represent the public, the general assemblies of which were henceforth discontinued. A senate was at the same time created, and six councillors were appointed to assist, or rather control, the proceedings of the doge. (*Daru*, i. 193, &c.) But notwithstanding the influence of the popular voice was greatly lessened by the establishment of the grand council, which included all the most distinguished citizens, it was still very considerable; and on several occasions the people endeavoured by violence to recover the power they had lost. In this, however, they were wholly unsuccessful; and at length, after various struggles, it was resolved, in 1319, that the grand council should no longer be elected, but that the dignity should be hereditary in its members! (*Daru*, i. 518.) The aristocracy was thus established on a solid

foundation; but no sooner had this been done than the dignified families became jealous of each other; and to avert the chance of any individual acquiring a preponderating influence in the state, a carefully devised scheme of indirect election to all the higher offices was established, at the same time that the nobles subjected themselves, the doge, and every one else, to a system of despotism, which not only determined the public and private conduct, but, in some measure, even the very thoughts of individuals! This was accomplished, partly by the institution of the Council of Ten, a committee chosen from the Grand Council, to which all the powers of the state were entrusted, and partly by the institution, in 1454, of three State Inquisitors, selected from the Council of Ten, and invested with all but unlimited authority. The proceedings of this most formidable tribunal were shrouded in the most impenetrable secrecy; but it was believed at the time, and is now certain, that it did not wait for overt acts, but proceeded on suspicion and presumption; that it had secret prisons; and that it made free use of the agency of spies, torture, and even of assassins. An individual disappeared, by what means no one knew; but if it were supposed that he had fallen a victim to the fears or suspicions of the Inquisitors, his relatives prudently abstained from all complaint, and even from making any inquiries respecting him. An unguarded expression, if reported, as was frequently the case, to the Inquisitors, was sure to draw their attention to the offender, so that not merely the freedom of the press, but even of speech, at least on political matters, was completely annihilated. Although, however, this jealous tyranny did not fail to repress, or rather extinguish some of the nobler energies of the mind, it must be admitted, that it preserved for a lengthened period the peace of the republic. It is true, also, that its despotism pressed equally on all classes and all individuals; the doge was as liable, and as likely, if occasion required, to be called to account by the Inquisitors as the humblest gondolier. Nothing, in fact, but implicit obedience to established authority, and a perfect abstinence from every sort of political preference and remark, could enable any individual, however high or low, to sleep soundly in Venice.

*Historical Notice.* — Venice was the earliest, and for a lengthened period the most considerable, commercial city of modern Europe. Her origin dates from the invasion of Italy by Attila in 452. A number of the inhabitants of Aquileia, and the neighbouring territory, flying from the ravages of the barbarians, found a poor but secure asylum in the cluster of small islands opposite the mouths of the Brenta, on which the city is built. In this situation they were forced to cultivate commerce and its subsidiary arts, as the only means by which they could maintain themselves. At a very early period they began to trade with Constantinople and the Levant; and notwithstanding the competition of the Genoese and Pisans, they continued to engross the principal trade in Eastern products, till the discovery of a route to India by the Cape of Good Hope turned this traffic into a totally new channel. The crusades contributed to increase the wealth, and to extend the commerce and the possessions of Venice. Towards the middle of the 15th century, when the Turkish sultan, Mahomet II., entered Constantinople sword in hand, and placed himself on the throne of Constantine and Justinian, the power of the Venetians had attained its maximum. At that period, besides several extensive, populous, and well cultivated provs. in Lombardy, the republic was mistress of Crete and Cyprus, of the greater part of the Morea, and most of the isles in the Egean Sea. She had secured a chain of forts and factories that extended along the coasts of Greece from the Morea to Dalmatia; while she monopolised almost the whole foreign trade of Egypt. The preservation of this monopoly, of the absolute dominion she had early usurped

over the Adriatic, and of the dependence of her colonies and distant establishments, were amongst the principal objects of the Venetian government; and the measures it adopted in that view were at once skilfully devised, and prosecuted with inflexible constancy. With the single exception of Rome, Venice, in the 15th century, was by far the richest and most magnificent of European cities; and her singular situation in the midst of the sea contributed to impress those by whom she was visited with still higher notions of her wealth and grandeur. Sanazarius is not the only one who has preferred Venice to the ancient capital of the world; but none have so beautifully expressed their preference.

Viderat Adriaci Venetum Neptunus in undis,  
Stare urbem, et toto ponere jura mari.  
Nunc iuisti Tarpesia quantumvis, Jupiter, arces  
Objice, et illa tua munera Martis, ait.  
Sic Tiberein petago praefers, urbem aspicit utramque,  
Illam homines dicat, hanc posuisse Deos.

Though justly regarded as one of the principal bulwarks of Christendom against the Turks, Venice had to contend, in the early part of the 16th century, against a combination of the European powers. The famous league of Cambray, of which Pope Julius II. was the real author, was formed for the avowed purpose of effecting the entire subjugation of the Venetians, and the partition of their territories. The emperor and the kings of France and Spain joined this powerful confederacy. But, owing less to the valour of the Venetians, than to dissensions amongst their enemies, the league was speedily dissolved without materially weakening the power of the republic. From that period the policy of Venice was comparatively pacific and cautious. But notwithstanding her efforts to keep on good terms with the Turks, the latter invaded Cyprus in 1570; and conquered it after a gallant resistance continued for eleven years. The Venetians had the principal share in the decisive victory gained over the Turks at Lepanto in 1571; but owing to the discordant views of the confederates, it was not properly followed up, and could not prevent the fall of Cyprus.

The war with the Turks in Candia commenced in 1645, and continued till 1670. The Venetians exerted all their energies in defence of this valuable island; and its acquisition cost the Turks above 200,000 men. The loss of Candia, and the rapid decline of the commerce of the republic, now almost wholly turned into other channels, reduced Venice, at the close of the 17th century, to a state of great exhaustion. She may be said, indeed, to have owed the last 100 years of her existence more to the forbearance and jealousies of others than to any strength of her own. Nothing, however, could avert that fate she had seen overwhelm so many once powerful states. In 1797, the "maiden city" submitted to the yoke of the conqueror: and the last surviving witness of antiquity—the link that united the ancient to the modern world—stripped of independence and of wealth, now enjoys only a precarious existence, and is slowly sinking into the waves whence she arose.

The foundation of Venice is described by Gibbon, c. 35.; and in his 60th chapter he has eloquently depicted her prosperity in the year 1200. Mr. Hallam, in his work on the *Middle Ages* (i. 479–487.), has given a brief account of the changes of the Venetian government. Her history occupies a considerable space in the voluminous work of M. Sismondi on the *Italian Republics*; but his details as to her trade and commercial policy are singularly meagre and uninteresting. All previous histories of Venice have, however, been thrown into the shade by the admirable work of M. Daru (*Histoire de la République de Venise*, 2d ed. 8 vols. 8vo. Paris, 1821). Having had access to genuine sources of information, inaccessible to all his predecessors, M. Daru's work is as superior to theirs in accuracy, as it is in most other qualities required in history.

**Trade, Navigation, and Manufactures of the Venetians in the 15th Century.**—The Venetian ships of the largest class were denominated galleasses, and were fitted up for the double purpose of war and commerce. Some of them carried 50 pieces of cannon, and crews of 600 men. These vessels were sometimes, also, called argosiers or argosies. They had early an intercourse with England; and argosies used to be common in our ports. In 1325, Edward II. entered into a commercial treaty with Venice, in which full liberty is given to them, for 10 years, to sell their merchandise in England, and to return home in safety, without being made answerable, as was the practice in those days, for the crimes or debts of other strangers. (*Anderson's Chron. Deduction*, Anno 1325.) Sir William Monson mentions, that the last argosie that sailed from Venice for England was lost, with a rich cargo and many passengers, on the coast of the Isle of Wight, in 1567.

In the beginning of the 15th century, the annual value of the goods exported from Venice by sea, exclusive of those exported to the states adjoining her provinces in

Lombardy, was estimated, by contemporary writers, at 10,000,000 ducats; the profits of the out and home voyage, including freight, being estimated at 4,000,000 ducats. At the period in question, the Venetian shipping consisted of 3,000 vessels of from 100 to 200 tons burden, carrying 17,000 sailors; 300 ships with 8,000 sailors; and 45 galleys of various sizes, kept aloft by the republic for the protection of her trade, &c., having 11,000 men on board. In the dock-yard, many labourers were usually employed. The trade to Syria and Egypt seems to have been conducted principally by ready money; for 500,000 ducats are said to have been annually exported to these countries; 100,000 were sent to England. (*Daru*, tome ii. p. 189. &c.) The vessels of Venice visited every port of the Mediterranean, and every coast of Europe; and her maritime commerce was, probably, not much inferior to that of all the rest of Christendom. So late as 1518, 5 Venetian galleasses arrived at Antwerp, laden with spices, drugs, silks, &c. for the fair at that city.

The Venetians did not, however, confine themselves to the supply of Europe with the commodities of the East, and to the extension and improvement of navigation. They attempted new arts, and prosecuted them with vigour and success, at a period when they were entirely unknown in other European countries. The glass manufacture of Venice was the first, and for a long time the most celebrated, of any in Europe; and her manufactures of silk, cloth of gold, leather, refined sugar, &c. were deservedly esteemed. The jealousy of the government, and their intolerance of any thing like free discussion, was unfavourable to the production of great literary works. Every scholar is, however, aware of the fame which Venice early acquired by the perfection to which she carried the art of printing. The classics that issued from the Aldine presses are still universally and justly admired for their beauty and correctness.

But the policy of government, though favourable to the introduction and establishment of manufactures, was fatal to their progressive advancement. The importation of foreign manufactured commodities into the territories of the republic for domestic consumption was forbidden under the severest penalties. The processes to be followed in the manufacture of most articles were regulated by law. — *Des l'année 1172, un tribunal avait été créé pour la police des arts et métiers, la qualité et la quantité des matières furent soigneusement déterminées.* (*Daru*, liv. 153.) Having, in this way, little to fear from foreign competition, and being tied down to a system of routine, there was nothing left to stimulate invention and discovery; and during the last century the manufactures of Venice were chiefly remarkable as evincing the extraordinary perfection to which they had early arrived, and the absence of all recent improvements. An inextinguishable judge, M. Berthollet, employed by the French government to report on the state of the arts of Venice, observed, "*Que l'industrie des Vénitiens, comme celle des Chinois, avait été précocée, mais éteinte stationnaire.*" (*Daru*, liv. p. 161.)

M. Daru has given the following extract from an article in the statutes of the State Inquisition, which strikingly displays the real character of the Venetian government, and their jealousy of foreigners:—"If any workman or artisan carry his art to a foreign country, to the prejudice of the republic; he shall be ordered to return; if he do not obey, his nearest relations shall be imprisoned, that his regard for them may induce him to come back. If he return, the past shall be forgiven, and employment shall be provided for him at Venice. If, in despite of the imprisonment of his relations, he persevere in his absence, an emissary shall be employed to despatch him; and after his death his relations shall be set at liberty!" — (Tome liv. p. 150.)

The 19th book of M. Daru's history contains a comprehensive and well-digested account of the commerce, manufactures, and navigation of Venice. But it was not possible, in a work on the general history of the republic, to enter so fully into the details as to these subjects, as their importance would have justified. The *Storia Civile e Politica del Commercio de' Veneziani*, di Carlo Antonia Marin, in 8 vols. 8vo., published at Venice at different periods, from 1798 to 1808, is unworthy of the title. It contains, indeed, a great many curious statements; but it is exceedingly prolix; and while the most unimportant and trivial subjects are frequently discussed at extreme length, many of great interest are either entirely omitted, or are treated in a very brief and unsatisfactory manner. The commercial history of Venice remains to be written; and were it executed by a person of competent attainments, it would be a most valuable acquisition.

**Present Trade and Manufactures of Venice.**—From the period when Venice came into the possession of Austria, down to 1830, it seems to have been the policy of the government to encourage Trieste in preference to Venice;

\* The native authorities say 16,000; but there can be no doubt that this is a grossly exaggerated statement, and that 1,000 would be much nearer the mark.

and the circumstance of the former being a free port, gave her a very decided advantage over the latter. Latterly, however, a more equitable policy has prevailed. In 1830, Venice was made a free port, and has since fully participated in every privilege conferred on Trieste. But, notwithstanding this circumstance, the latter still continues to preserve the ascendancy; and the revival of trade that has taken place at Venice has not been so great as might have been anticipated. The truth is, that except in so far as she is the *entrepôt* of the adjoining prov. of Lombardy, Venice has no considerable natural advantage as a trading city; and her extraordinary prosperity during the middle ages is more to be ascribed to the comparative security enjoyed by the inhabitants, and to their success in engrossing the principal share of the commerce of the Levant, than to any other circumstance. Still, however, her trade is far from inconsiderable. But, unfortunately, there are no means by which to ascertain its precise amount. The great articles of import are sugar, coffee, and other colonial products; indigo and other dye stuffs, olive oil, salted fish, various descriptions of cotton, woollen, and other manufactured goods; wheat and other grain, from the Black Sea; tin plates and hardware, raw cotton, &c.; amounting, in all, to the value probably of 1,500,000*l.* or 1,600,000*l.* a year. The exports principally consist of silk and silk goods, wheat and other grain, paper, jewellery, glass, and glass wares, Venetian trawls, books, with a great variety of other articles, including portions of most of those that are imported. It should, however, be observed, that by far the greater part both of the import and export trade of the city is carried on through Trieste by coasting vessels, that are every day passing between the two cities. The smuggling of prohibited and over-taxed articles into Austrian Lombardy is practised to a great extent. It is believed that fully two thirds of the coffee made use of in Lombardy is clandestinely introduced; and sugar, British cottons, and hardware, with a variety of other articles, are supplied through illegitimate channels. The facilities for smuggling, owing to the nature of the frontier, and the ease with which the officers are corrupted, are such, that the articles passing through the hands of the fair trader afford no test of the real extent of the business done. It is to be hoped that the Austrian government will take an enlightened view of this important matter. It cannot but be anxious for the suppression of smuggling; and it may be assumed that this is not practicable otherwise than by a reduction of duties. The regulations as to the payment of the duties on goods destined for the interior, the clearing of ships, &c., are the same at Venice as at Trieste; which see.

The manufactures of Venice are very various, and more extensive than is generally supposed. The glass-works, which produce magnificent mirrors, with every variety of artificial pearls and gems, coloured beads, &c., situated on the island of Murano, employ, in all, about 4,000 hands, including the women and children employed in arranging the beads. (*Bowering*.) Jewellery, including gold chains, is also extensively produced; as are gold and silver stuffs, velvets, silks, laces, and other expensive goods; and trowels, soap, candlewax, wax-lights, &c., to a greater or less extent. Printing is more extensively carried on in this than in any other city of Italy, and books form a considerable article of export. Ship-building is also carried on to some extent, both here and at Chiozza. In 1836, the first steam-engine seen in Venice was set up for a sugar-refinery.

From the circumstance of Venice being situated nearly opposite the mouths of the Brenta, which bring down large quantities of mud, the probability is that the lagoon, by which she is surrounded, will ultimately be filled up. Under the republic this was a subject of great apprehension, and every device was resorted to that seemed likely to avert a result so pregnant with danger to the independence of the city. But now that there is no particular motive for hindering the mud from accumulating in the lagoon, it is probable that, in the course of time, the shallows will be converted into terra firma, and Venice lose her insular position.

There belong to the city, exclusive of fishing-boats, about 30,000 tons of shipping, of which a large proportion is employed in the coasting trade. Many of the inhabs. depend for their subsistence on fishing in the lagoon, and the contiguous portion of the Adriatic. (Exclusive of the authorities already referred to, see *Bowering's Report on the Statistics of Italy; Commercial Dict.; Commercial Circulars, &c.*)

VENLOO, a fortified town of Holland, prov. Limbourg, cap. cant., on the Meuse, 40 m. N.E. Maestricht. Pop., in 1836, 6,525. It is surrounded by a marshy tract of country; but is the centre of an active transit trade, and has manufactures of pins, wafers, tobacco-pipes, and various other small articles, with tanneries, sugar-refineries, and vinegar distilleries. It was formerly one of the Hanse towns; in 1702 it was taken by the troops under Marlborough.

VENOSA (an. *Venusia*, on the frontier of Lucania and Apulia), a town of the Neapolitan dom., prov. Basilicata, 24 m. N. Potenza. Pop. 6,000. It stands on a perfectly flat, but not very extensive, plain. It is reached by a long, winding ascent, when it breaks on the sight under a favourable point of view, chiefly due to the venerable aspect of its castle, an edifice of the 15th century, which, though a complete ruin, exhibits such magnitude of dimensions and regularity of construction as to form a very striking feature in the landscape. The walls of Venosa have long since been levelled with the ground, but the gateways still exist. It is well built, and has numerous public edifices, including a large cathedral, 5 parish churches, an abbey church, a church erected in the 10th century from the materials of a Roman amphitheatre, in which are the tombs of Robert de Guiscard, and other Norman chieftains; an hospital, 2 workhouses, a museum of antiquities, &c.

*Venusia* is celebrated as the birth-place of Horace, the prince of Latin lyric poets and satirists, born on the 8th of Dec., anno 66 B.C. (A. U. C. 688), in the consulship of L. Manlius Torquatus.

"O nata mecum consule Manlio."—*III. Od. 21.*

A bust of the poet, on a column of rough stone, has been set up in the city. In the vicinity are many places which have acquired interest from the references made to them by Horace. (*Craven's Excurs. in the Abruzzi*, 270, 280.; *Traboschi, Della Letteratura Italiana*, i. 177., ed. Modena, 1787.)

VERA CRUZ, a town and the principal sea-port of Mexico, on the S.W. side of the Gulf of Mexico, cap. of the state of its own name, 193 m. E. by S. Mexico, and 225 m. S.E. Tampico. Lat. 19° 11' 52" N., long. 96° 8' 43" W. Pop. uncertain; but previously to the revolution, it was estimated at 16,000. It is well built and clean, and its towers, cupolas, and battlements, give it an imposing appearance from the sea. It is, however, surrounded by barren sand-hills and ponds of stagnant water, and is excessively unwholesome, being, in fact, the principal seat of the yellow fever. The older inhabs. and those accustomed to the climate are not so subject to this formidable visitation as strangers, all of whom, even if coming from the Havannah and the W. India islands, are liable to the infection. No precautions prevent its attack, and numerous individuals have died at Xalapa, on the road to Mexico, who merely passed through this pestilential focus. The badness of the water at Vera Cruz is supposed to have some share in producing the complaint. The houses of Vera Cruz are mostly large, some of them being three stories high, built in the old Spanish or Moorish style, and generally enclosing a square court, with covered galleries. They have flat roofs, glass windows, and generally wooden balconies in front, their interior arrangement being the same as in Old Spain. The town and castle are built of madreporo, the lime that forms the cement being of the same material. There is one tolerably good square, of which the government-house forms one side, and the principal church the other. The footpaths are frequently under arcades. No fewer than 16 cupolas or domes used to be counted from the sea, but only 6 churches are now in use; and most of the religious buildings have been neglected or abandoned since the Spaniards were expelled from the town. Rain-water is carefully preserved in tanks; and most sorts of provisions, excepting fish, are dear. Crowds of vultures and buzzards perform the office of scavengers. (*Bullock in Mod. Trav.*, xxv.)

The castle of St. Juan de Ulloa, which commands the town, is built on the small island of the same name, about 400 fathoms from the shore. It is a strong citadel, and its N.W. angle supports a light-house, with a brilliant revolving light, 79 ft. above the sea. The harbour of Vera Cruz is a mere roadstead between the town and castle, and is exceedingly insecure, the anchorage being so very bad that no vessel is considered safe unless made fast to brass rings fixed for the purpose, in the castle wall; nor are these always a sufficient protection during strong N. winds. But notwithstanding its numerous disadvantages, Vera Cruz maintains its commercial importance; though latterly Tampico, in a healthier situation, with a better port, has been growing into consequence. The precious metals, cochineal, sugar, flour, indigo, provisions, sarsaparilla, leather, vanilla, jalap, soap, logwood, and pimento, are the principal articles exported; and linen, cotton, woollen, and silk goods, paper, brandy, cocoa, quicksilver, iron, steel, wine, wax, &c. (See *ante*, 317.) During the period that the foreign trade of Mexico was carried on exclusively by the *flota*, which sailed periodically from Cadiz, Vera Cruz was celebrated for its fair, held at the arrival of the ships. It was then crowded with dealers from Mexico, and most parts of Spanish America; but the abolition of the system of regular fleets, in 1778, proved fatal to this fair as well as to the still more celebrated fair of Portobello. We have already noticed (*ante*, p. 317.) the wretched state of disrepair into which the great road from Vera Cruz to

Mexico, formed by the Spaniards, has latterly been allowed to fall. This inflicts a great injury on the trade of the port.

Veracruz was founded towards the end of the 16th century, on the spot where Cortez first landed; it received the title and privileges of a city from Philip III. in 1615. The castle was taken by a French squadron, after a vigorous bombardment, in 1839; but was soon after restored to the Mexicans. (*Humboldt; Ward; Poimett; Mod. Trav.*, xxv.; *Blunt's Coast Pilot; Comm. Dict.*)

VERCELLI (an. *Verocella*), a town of N. Italy, Sardinian dom., div. Novara, cap. prov. on the Sesia, and on the high road between Turin and Milan, 39 m. N.E. by E. Turin. Pop., in 1868, 18,353. It has a large marketplace, one of the best cathedrals in Piedmont, several other churches, and good private buildings, a large and well kept hospital, museum, &c., with (in its environs) some fine promenades. Its fortifications were destroyed by the French in 1704. It is the see of an archbishop, and has some silk manufactures; but its chief trade is in rice, raised in the neighbourhood. A canal connects Vercelli with Ivrea. The date of its foundation is uncertain, but it was a town of some note in the time of the Romans. After suffering severely from the northern invaders, it revived under the Lombards, and took the lead of Turin till the latter became the residence of the court. (*Dict. Geog.*, &c.)

VERDUN (an. *Verodunum*), a town of France, dep. Meuse, cap. arrond., on the Meuse, where it begins to be navigable, and by which it is divided into 5 separate parts, 30 m. N.W. by N. Bar-le-Duc. Pop., 1836, ex. comm., 9,151. It has a citadel; and its defences were improved by Vauban. It is tolerably well built; but several of its streets are badly paved and steep. The bishop's palace, new cavalry barracks, military magazines, and theatre, are among the most remarkable buildings. It has 6 churches, including the cathedral; a Protestant church, a synagogue, a communal college, library with 15,000 vols., &c. A planted esplanade separates the town from its citadel. Verdun has manufactures of fine striped serges, flannels, cotton yarn, liquors, &c., and several large tanneries. It was a station of importance under the Romans; and in the middle ages, under the Germanic emperors, it enjoyed the privileges of a free imperial city. It was definitively annexed to France in 1648; and is best known in modern times from its having been selected by Napoleon for the residence of the English prisoners detained in France after the rupture of 1803. (*Hugo, art. Meuse, &c.*)

VERMONT, one of the states comprised in the North American republic, in the N.E. section of the Union, making part of what is called New England, between lat. 42° 40' and 45° N. and long. 71° 15' and 72° 55' W.; having E. New Hampshire, from which it is separated in its whole extent by the Connecticut River; S. Massachusetts; W. New York, Lake Champlain forming half the boundary on this side; and S. Lower Canada. Length, N. to S., 157 m. Average breadth about 60 m. Area, 9,840 sq. m. Pop., in 1840, 211,944. The surface is generally hilly; it is traversed from N. to S. by a range of mountains, some summits of which rise to upwards of 4,000 ft. in height. About the centre of the state they divide into two ridges, the principal of which passes in a N.E. direction into Lower Canada. These hills, being covered with fine forests of pine, cedar, spruce, &c., are called the Green Mountains, and their verdant appearance has given its name to the state. The rivers are inconsiderable: most of those flowing E. are merely small tributaries of the Connecticut; those, on the W. side are larger and longer, and some of the principal rise on the E. side of the mountain-chain, which they break through to fall into Lake Champlain. The climate varies according to differences of level and other circumstances; but the winters are colder than might have been expected either from lat. or elevation. The soil is moderately fertile, the best arable land being between the hills and Lake Champlain; but the greater part of the surface is more suitable for pasturage than for tillage.

According to the official returns, 652,253 bushels of wheat, 2,342,500 do. oats, 1,047,600 do. maize, and 447,318 rye were reaped in 1841, in addition to 8,207,000 do. potatoes. Barley, buckwheat, hops, and tobacco are also grown, but in small quantities. Apples succeed better than in Europe; and, in 1840, the value of the produce of fruit of various kinds was estimated at 1,109,000 dollars, being more than in any other state of the Union, New York excepted. In the same year 4,220,000 lbs. maple sugar, and 4,200 lbs. silk cocoons were gathered. The breeding of stock for export to Boston and the adjacent states, the West Indies, &c., is, however, the chief branch of industry; and there are said to be about 1,400,000 sheep, 350,000 head of cattle, 60,000 horses, and nearly 300,000 hogs in Vermont. Iron is very abundant, and coppers to the value of from 70,000 to 80,000 dollars, is made annually from native pyrites.

Marble of good quality is quarried, and lead is also among the mineral products. Linen and woollen fabrics are made in most families, and about 34 million yards of cotton cloth and 4,000 lbs. of yarn are annually furnished by the various mills and factories. Pearl-shells and lumber are among the other chief exports; but as the foreign trade of the state is principally carried on through the adjacent states, no proper estimate can be given of its amount. The public works are insignificant, comprising only three short canals.

The legislature formerly consisted of a single house of assembly; but, in 1836, two separate houses (a senate of 30 members, and house of representatives composed of 1 member from each town) were established; which, together with its governor, lieutenant-governor, and executive council, are chosen annually by the people. The right of suffrage is vested in every male inhabitant, twenty-one years of age who has resided in the state for the year previously to the election. The judicial power is in a supreme court of 5 judges, and co. courts, each composed of 1 judge of the supreme court and 2 assistant judges. The supreme court sits once, and the co. courts twice, in each co. Judges are chosen annually by the general assembly, and a court of censors by a popular vote once in seven years. Vermont is divided into 14 cos. Montpelier, having, in 1840, a pop. of 3,728, is the cap.; Burlington, where the university of Vermont is situated, though more populous, has only about 4,300 inhabitants. Schools are widely diffused in this state, and Middlebury College and Norwich University are flourishing institutions. Public revenue, in 1840, 90,724 dollars; expenditure, 90,000 do. Vermont has no public debt. This state was first explored by the French Canadians; but the earliest settlement was made by the English of Massachusetts, in 1721. Subsequently, New Hampshire and New York disputed the claim to this territory; but it was finally ceded by the British parliament to the latter. But, dissatisfied with this connection, it declared itself independent in 1777. (*Darby's View of the U.S.; Amer. Almanack, 1841-42; Amer. Ensign, &c.*)

VERONA, a celebrated city of Austrian Italy, cap. deleg. of same name, on the Adige, at the point where the last declivities of the Alps sink into the great plain of Lombardy, 64 m. W. Venice; lat. 45° 25' 9" N., long. 11° 0' 54" E. Pop., in 1837, 43,486. (*Bergamus.*) It is divided into two unequal parts by the Adige, which sweeps through it in a bold curve, and forms a peninsula, within which the whole of the ancient, and the greater part of the modern, city is enclosed. The river, which is wide and rapid, is here crossed by four noble stone bridges.

Verona is an extremely well situated, well built, and most interesting city. "You enter it," says Mr. Ross, "by a magnificent approach, and a street probably the widest in Europe. This street is indeed short, and single in its breadth, but the city in general pleases by its picturesque appearance, to which an abundance of marble quarries has not a little contributed, thirty-five varieties of this species of stone being found in its neighbourhood." (*Lettres*, i. 41.) The houses frequently present, in their form and ornaments, fine proportions, and beautiful workmanship. The old walls and towers still remain, and the city has five gates, two of which are fine structures by Sammartino. Its former military defences were destroyed by the French, after the revolt of the inhabitants, in 1797; but extensive fortifications are again in the course of being constructed.

But the great glory of Verona is its amphitheatre, one of the noblest existing monuments of the ancient Romans. Excepting the Colosseum at Rome, it is the largest extant edifice of its class. Like all other structures of the same kind, it is elliptical, the extreme length of its transverse and conjugate diameters to the outside of the outer walls being respectively about 510 and 410 ft.; while those of the arena are 245 and 160 ft. (*Woods*, i. 226.) Its outer wall or circuit, which had 72 arches in every story, has been nearly destroyed, with the exception of one fragment containing three stories of four arches each, rising to the height of about 100 ft. Over this, however, there was a fourth story, so that the entire height of the building, when perfect, must have exceeded 120 ft. Internally it has suffered comparatively little; and its concentric rows of benches or seats, of which 43 still remain, exclusive of 2 sunk below ground, with its corridors, stairs, &c., are wonderfully well preserved. Each row of seats is 1½ ft. in height, and as much in breadth; and allowing 1½ ft. of space to each individual, the Marquis Maffei supposes that the amphitheatre might have accommodated 22,000 spectators! The interior of the amphitheatre having been in parts a good deal dilapidated, it was repaired at different periods in the 16th century, when the broken and wanting seats were replaced by others. But these repairs, though, on the whole, highly creditable to the Veronese, do not appear to have been very executed. The ancient benches appear to have been of vast blocks of marble, admirably cut and jointed; whereas the modern benches consist, according

to Maffei, of a soft flaky stone, which has, in parts, yielded to the weather; and the same distinguished authority adds, that but little care has been taken in laying the stones, and that in parts the elliptical curvature has not even been observed. These defects, however, are not visible on a cursory inspection of the building, which astonishes alike by its mass, its antiquity, and its preservation.

Owing to the want of inscriptions, and of all reference to its origin in the classical writers, we are without any authentic information either as to the founders or the era of this great work. Most probably, however, it was built somewhere between the reigns of Titus and Trajan, or in the early part of that of the latter. In the middle ages it was sometimes used for the exhibition of shows and sports, and sometimes as an arena for judicial combats. In more modern times, a bull fight was exhibited here in honour of the Emperor Joseph II., then at Verona; and at a still later period, the Pope, in passing through the city, gave his benediction to a vast multitude collected in the amphitheatre. The French, when masters of Verona, had the bad taste to erect in the arena a wooden theatre, in which plays, farces, equestrian feats, &c., were performed for the amusement of the troops. This barbarous novelty is still kept up. (Full particulars respecting the amphitheatre are given in the *Verona Illustrata* of the learned Marquis Maffei. That part of the work which relates to amphitheatres having been printed separately, was translated into English, and published in 8vo., London, 1730.)

But the amphitheatre is not the only monument of antiquity that distinguishes Verona. In the middle of a street called the *Corso*, is an ancient double gateway, which, on the strength of an inscription importing that the adjacent walls were built by Gallienus, has been named after that emperor; but though loaded with supererogatory ornaments, the Veronese antiquaries affirm that its style is too good for his age. Each gateway is ornamented with Corinthian pilasters supporting a light pediment; and above are two stories with six small arched windows in each. The whole is of marble. The remains of another gateway, of a similar but chaster form, probably the entrance to the ancient forum, are to be seen in another street, and near the old Gothic castle, is the arch of the Gavii, perhaps part of a sepulchral edifice, but, at any rate, of very remote antiquity. Two arches in the purest style of Roman architecture make a part of one of the bridges; and the remains of another bridge, and the traces of a very large ancient theatre and naumachia, are still extant. Addison and Evelyn speak of a triumphal arch of Flavianus, as one of the noblest remains of antiquity in Europe, and of an arch commemorating the victory of Marius, with various temples and aqueducts; but as few or no remains of these exist at present, it would seem that the antiquities of Verona had suffered greatly since the beginning of last century.

The ecclesiastical buildings comprise interesting specimens of middle-age architecture. The cathedral, an edifice of the 12th century, has nothing particularly remarkable except the Assumption by Titian, and the tomb of Pope Lucius III., who, when driven from Rome in 1185, found a secure asylum in this city. In respect of architectural merit the cathedral is very inferior to the church of St. Anastasia, built by the Dominicans at the beginning of the 13th century. Mr. Woods says that if the front were finished this edifice would probably be the most perfect specimen of the style of architecture to which it belongs. The church of St. Zeno, a curious structure, with a remarkable crypt, is said to have been founded by Pepin, but it was not completed till 1178. Its front is covered with bas-reliefs in stone, its doors with sculpture in bronze of a very early date; and near it are the remains of a palace in which the German emperors occasionally resided during the 12th and 13th centuries. Several other churches are worthy of notice: in that of San Giorgio is a fine picture of Paul Veronese. The tombs of the Scala family (*Scaligeri*), once lords of Verona, stand in an inclosure in one of the thoroughfares. According to Forsyth, they are "models of the most elegant Gothic, light, open, spiry, full of statues caged in their fretted niches; yet slender as they seem, these tombs have stood entire for 500 years in a public street the frequent theatre of sedition." The *Ponte dei Castel Vecchio*, built in 1354, is remarkable for an arch 161 feet in span, forming part of a circle. (Woods.) The town-hall is ornamented externally with busts of the most celebrated natives of Verona, and has within it some fine paintings. The exchange; the *Musco Lapidario*, and *Philotti*, both having extensive collections of ancient monuments; the opera-house, the fine Ionic portico of which forms, with the arcades of the museum, three sides of a handsome square; the episcopal and new vice-regal palaces; the *Palazzo Bevilacqua*, an edifice by Sanssouci; the *Cassella*, palace and several other noble residences; the lyceum, philharmonic academy founded by the Marquis Maffei, and arsenal, are among the most

Vol. II.

conspicuous edifices in the city. Verona is the seat of the high court of justice and of the superior military authorities for the Lombardo-Venetian kingdom, and of a court of primary jurisdiction for its deleg. It is a bishop's see, and has several gymnasia, a theological seminary, and numerous royal and other schools, learned societies, public and private libraries, galleries, &c. English travellers are shown what is called "Juliet's tomb," which is merely an old sarcophagus without a cover, lying in a garden where it has been made use of as a cistern.

Verona, according to Berghaus, is distinguished as the most industrious of Italian towns. "It has 60 silk twist factories, 9 establishments for weaving silks, large leather, earthenware, and soap factories, and numerous factories for the weaving of linen and woollen fabrics. Its trade is chiefly in the product of these, and in raw silk, grain, oil, sunnch, and other agricultural produce." (*Allg. Länder, &c.*) It has two weekly markets, and two considerable annual fairs, each lasting 15 days.

We have not room in details as to the origin of Verona. Under the Romans, however, she became a flourishing city; and in the time of Strabo was superior to Brixia, Mantua, Regium, Comum, &c. She was the cap. of the kingdom of Italy from the time of Odoacer to that of Berengarius; and from the 12th to the 13th century she was the cap. of a considerable territory, governed successively by the Scaligers, Visconti, &c. Under the former, in the 13th and 14th centuries, occurred the feuds between the Cappelletti and Montecchi, immortalized by Shakspeare. In 1405 Verona submitted to Venice, of whose dominions it continued to form an important portion till the overthrow of the Venetian republic in 1797. In 1822 it was the seat of a congress.

Perhaps no city of Italy has given birth to a greater number of distinguished men than Verona. Among these may be mentioned Catullus,—

"Tantum magna suo debet Verona Catullo,  
Quantum parva suo Mantua Virgilio."

Martini, lib. xiv. epig. 135.

Macer, Cornelius Nepos, Pliny the Elder, &c., who died in antiquity an imperishable lustre over the place of their birth. At a later period Guarini, Calderini, Panvinius, and Fraeustorius contributed to the revival of literature and of the ancient fame of their native city; which in more modern times has been still further extended by the labours of the famous painter Paolo Cagliari, surnamed Veronese, born here in 1530; Bianchini, distinguished alike as a mathematician, a historian, and a critic; Maffei, whose *Verona Illustrata*, already referred to (1781-1782, in folio, and 4 vols. small 4to.), is a work of the greatest research and value; the poet Pindemonte, &c.

Vitruvius, in antiquity, and the famous Julius Cæsar Scaliger, have also been included, though on no good grounds, among the illustrious natives of Verona. The latter, indeed, represented himself as the eldest son of one of the Scaligers, lords of Verona, and as entitled to that seigniorly! But Maffei and Tiraboschi have shown that there is not so much as the shadow of a foundation for this statement; that it is a pure fiction, and that Scaliger was, in fact, the son of a miniature-painter of the name of Bordonio; and was most probably born at Padua. (*Verona Illustrata*, p. 300; *Tiraboschi*, vii. 1481.)

VERSAILLES, a town of France, formerly the chief residence of the French court, d'ep. Seine-et-Oise, of which it is the cap., in an undulating plain, 9 m. S.W. Paris. Pop. in 1836, ex. comm., 28,776. It is one of the handsomest towns in the kingdom; it consists principally of 3 wide streets, lined with trees, diverging from the *Place d'Armes*, an open space in front of the palace: the central and widest of these streets is called the avenue de Paris; and those on the N and S, the avenues of St. Cloud and St. Germain. The other streets, though of less width, are equally regular, cross each other at right angles, and are lined with handsome residences. The cathedral of St. Louis, founded by Louis XV. in 1743, that of Notre Dame, built after the design of Mansard, in the previous reign; the church of St. Symphonien, the town-hall, prefecture, theatre, royal college, public library with 48,000 vols., civil and military hospital, barracks, *dépôt* of naval and colonial archives, and hall of the *jeu de paume*, in which the deputies of the national assembly made their famous declaration (see below), are among the principal public buildings. In one of the open spaces is a marble statue of General Hoche, a native of Versailles. The town is ornamented by many handsome fountains, &c.; but it wears a dull and deserted appearance, being no longer resorted to by the *beau monde*.

Versailles is wholly indebted for its celebrity, and, indeed, for its existence, to the royal palace in its immediate vicinity. Louis XII. had a hunting-seat here; but the present edifice, which is of prodigious size and magnificence, was erected by Louis XIV., who expended

immense sums on its construction and embellishment. On the E. side, where it faces the place d'armes, it consists of only an irregular succession of buildings, enclosing a few small courts. But on the opposite side, facing the gardens, it presents a noble façade, 645 yards in length, 3 stories in elevation, ornamented with Ionic pilasters, and with 80 statues 16 ft in height, allegorically representing the months, seasons, arts and sciences, &c., and crowned by a balustrade. Its galleries and saloons, enriched with every variety of coloured marbles, and splendidly gilt, are alike vast and magnificent. The Salon d'Hercule and the Salles des Marechaux, de Venus, Diane, Mercure, Mars, Apollon, l'Abondance, de la Guerre, &c., so named from the paintings on their ceilings, walls, or other appropriate devices, are all noble apartments. The Grande Galerie is 228 ft. in length, by 32 ft. in breadth, and 42 ft. in height; the ceiling, painted by Le Brun, represents some of the most striking events in the early part of the reign of Louis XIV. At one of its extremities is the Salon de la Paix, corresponding with the Salon de la Guerre. Besides its innumerable apartments, the palace has an elegant chapel, in which the unfortunate Marie Antoinette was united to Louis XVI. on the 16th of May, 1770, an opera-house, or theatre, capable of accommodating 3,500 spectators, a magnificent staircase, &c.

The palace has not been occupied by the court since 1789, and was getting into a state of disrepair, when it was entirely renovated and transformed by his present majesty, Louis Philippe, into what may be called a national museum, intended to illustrate the history, and to exhibit the progress of arts, arms, and civilisation in France. In pursuance of this design, many small apartments, formerly appropriated to the lodging of the various functionaries attached to the court, have been converted into noble saloons. Of these, the Salle des Marechaux, noticed above, containing portraits of all the Marshals of France, the Galerie des Batailles, the Salle de 1830, the Galerie de Sculpture, &c., are amongst the most striking. The palace is, in fact, filled with an immense collection of statues and paintings exhibiting all the principal personages and events in the history of the monarchy, from the reign of Clovis down to that of Louis Philippe. Of course, many of these statues and pictures must be very inferior; but these will be gradually replaced by others, and the collection is exceedingly interesting. The library is intended to comprise copies of all works having reference to the history and state of France. The fitting up of the apartments is, also, superb; and the whole reflects the highest credit on the taste and liberality of the king.

Immediately adjoining the palace on the W. is the little park, comprising the gardens, numerous reservoirs, fountains, and public walks; the orangery; Ruins d'Apollon, and Bassin de Neptune, both having sculptured groups of mythic merit, &c. In this park are also the Great and Little Trianon, two royal palaces on a minor scale, and the grand water-works, of unrivalled magnitude, which, however, play only on great occasions. They are supplied from the Seine, by the aqueduct of Marly. The great park comprises a large tract of country, including several villages. (*Hugo, art. Versailles; Guide du Voyageur en France, &c.*)

Versailles has some manufactures of cotton yarn, and wax lights, but only on a limited scale; it had formerly an extensive factory of fire-arms, but this appears to be given up. It is the see of a bishop, and the seat of tribunals of primary jurisdiction and commerce, and of societies of literature and agriculture, &c. Philip V. of Spain, Louis XV., Louis XVI., Louis XVIII., Charles X., and several other eminent personages, were born at Versailles. It is also intimately connected with the history of the Revolution. The States General met in the great hall of the palace on the 4th of May, 1789. And here, on the 17th of June, the *tiers-état*, having been joined by the whole body of inferior clergy, and some of the nobles, constituted themselves the National Assembly, and the sole representatives of the people. On the 20th of the same month the deputies, finding the doors of the hall in which they had been accustomed to meet shut against them, retired to the Tennis Court, and took the famous oath, by which they bound themselves to continue their sittings till the constitution of the kingdom had been fixed on a solid basis! The revolution, thus fairly begun, set in with a violence which all the talent and firmness of purpose of Napoleon could, perhaps, have been unable to control, and which the vacillation of the good-natured Imbecile king served only to aggravate. And so rapid was the progress of events, that on the 5th and 6th of October the palace of Versailles was forced by a mob, consisting of the lowest scum of Paris; who, in the end, succeeded in forcing off the king and his family to the capital, to encounter, at the hands of the vilest ruffians, imprisonment, every species of indignity, and an ignominious death! Verviers is a town of Belgium, prov. Liege, cap. around, on the Vesdre, by which it is intersected, and

which is here crossed by two stone bridges, 14 m. E. Liege. Pop. in 1836, 19,079. It is divided into the upper and lower town, some of its streets are wide and well built, but many others are quite the contrary. When erected into a town in 1651, it was surrounded with walls, but these were afterwards demolished by the French. A new church, the town-hall, and a little theatre with a front of the Ionic order, are handsome buildings. It has a tribunal and chamber of commerce, a college, hospital, and several asylums, nearly thirty public schools, a philanthropic society, bath establishment, &c. The Vesdre is divided into numerous canals, for the use of the various manufactures, which have increased rapidly since the peace. These comprise about 50 woollen cloth factories, and more than 30 dyeing-houses, with fulling and other mills, soap-works, breweries, iron and lead foundries, &c. It has two markets weekly, and four annual fairs. Great quantities of fillers' earth are dug up in the vicinity. (*Vandermaelin, Dict. de Liège; &c.*)

VESOUÏ, a town of France, dép. Haute-Saône, of which it is the cap.; in the valley of the Durgeon, at the foot of the Mont de Vesouï, a height covered with vineyards and meadows, 56 m. E.N.E. Dijon. Pop. in 1836, ex. com., 5,792. It is well built and clean; most of its streets are wide and straight, and it has several good public buildings, including cavalry barracks, civil and military hospital, theatre, prefecture, town church, public baths, court house, town-hall, &c. It has, also, a public library, said to comprise 21,000 vols., a museum, and a departmental nursery ground; with manufactures of calico and gold lace, and some trade in corn, wine, salt, nails, and hardware. Near it are mineral waters, but these are turned to little account. (*Hugo, art. Haute-Saône, &c.*)

VESUVIUS (MOUNT), a celebrated mountain of S. Italy, *Etnæi ignis imitator*, being the only active volcano, of any consequence, at present existing on the European continent; on the E. shore of the bay of Naples, and 10 m. E. by S. from the city, the crater being in lat. 40° 48' N., long. 14° 27' E. Vesuvius does not belong to the Apennine system, but rises, altogether unconnected with any of its ramifications, out of the broad plain of Campania, including M. Somma on its inland side, it consists of a circular mass, the extreme height of which, about 2,800 ft. is to its diameter, 8 m., nearly as 1 to 1; it is somewhat less elevated than Mount Hecla, and only two fifths the height, with considerably less than one third the circuit of Etna. Mr. Maclaren, by whom it has been carefully examined and elaborately described, gives the following account of its external appearance:—"To gain a distinct conception of the aspect of the hill, shape out for yourself, by a mental effort, the following objects. *First*, a sloping plain, 3 m. long, and 3 m. broad, stretching up with a pretty rapid ascent, to an elevation of more than 2,000 ft., very rugged in the surface, and covered every where with black burnt stones, like the scoræ of an iron furnace; *second*, at the head of this plain, and towering over it, a cone of the same black burnt stones, with sides remarkably straight and uniform, shooting up in the blue sky to a further elevation of 1,500 ft.; *third*, behind this cone a lofty circular precipice (the front of Monte Somma), 1,400 ft. high, and 3 m. long, standing like a vast wall, and of the same burnt appearance; *fourth*, at the lower side of the plain, between the burnt ground and the sea, a belt of land, 2 m. broad, laid out in vineyards, but intersected every one or two furlongs by terraces of the same black calcined matter, projecting like off-shoots from the central mass, and now and then unveiling old currents of lava from beneath them. Very little lava is visible; but the course of the different currents is traced by the long terraces of scoræ which cover and flank them.

"The top of the cone, which is about 2,000 ft. in diameter, presented the aspect of an uneven plane in the end of 1838, but when visited about five weeks after the eruption (of 1839) it had a regularly formed crater, shaped exactly like a tea-cup. I estimated its width at 1,500 ft., and its depth at 500. The rim or crest of loose and solid matter which surrounded it, was of very unequal breadth, 400 or 500 ft. on the W. side, and apparently not 50 at some other parts of the circumference. Snow having fallen some days before, clouds of steam rose from the cavity, which, however, were neither so dense nor so constant as to prevent us from occasionally seeing the bottom of the crater very distinctly. It was nearly level, without crevices or openings, and covered with loose blocks of lava of no great size." (*Notes in France and Italy, 134, 135.*)

Geologically considered, Vesuvius is but the representative of a more ancient and much larger volcano, of which Monte Somma is a remnant, and in the centre of which the modern vent has been upheaved. Monte Somma, on the N.E. side of Vesuvius, is a ridge extending 3 m. in length, forming about one third part of a circle, and rather less lofty than the present cone of Vesuvius. The average distance of the escarpment of

Somma from the centre of the cone is about 1 m.; the back of the ridge dips outwards at an angle of 26°, while the front towards Vesuvius is nearly vertical, rising 1,377 ft. (420 metres) above the level space which divides it from Vesuvius, and which is called the *Atrio dei Cavalli*, or "vestibule of horses," because visitors to the crater are obliged to leave their horses, and perform the rest of the journey on foot. The *Atrio dei Cavalli* forms a segment of a circular ring, about  $\frac{1}{2}$  m. in breadth, at the base of the cone, dividing it from Somma, and having a continuation, in the shape of a depression, on the other sides, where a slight projection, called the *Pedimentum*, is supposed to indicate the place of the rest of the ancient escapement, which, when complete, must have formed a ring  $\frac{1}{2}$  m. in circ. (Maclaren, p. 140.); being of greater extent than any crater with which we are acquainted. Hence, Mr. Lyell considers it probable that the ancient volcano was higher than Vesuvius, and that the first recorded explosion of the latter blew up a great part of the cone itself, "so that the wall of Somma, and the ridge or terrace of the Pedimentum, were never the margin of a crater of eruption, but are the relics of a ruined and truncated cone." This species of phenomenon has not been without an example in modern times. During the eruption of Oct., 1822, more than 800 ft. of the cone were carried away by explosions, reducing the height of the mountain from about 4,200 to 3,400 ft. (Forbes's *Account of Mount Vesuvius*; Lyell's *Geology*, ii. 80. 88., &c.)

According to Maclaren, the rocks of Somma and Vesuvius are mineralogically distinct.\* Somma, like Vesuvius, is composed of strata of fragmentary and stony matter intermixed; but the stony matter of Vesuvius consists of lava, more or less cellular, scoriaceous on the surface, and forming long narrow bands on the surface of the lava. That of Somma is a loose pebbly, containing shells, and continuous with the beds under the tufa which forms the soil of the plain of Naples. Mr. Lyell says, "It is an extraordinary fact, that in an area of 3 sq. m. round Vesuvius, a greater number of simple minerals have been found than in any other spot of the same dimensions on the surface of the globe. Many only enumerated 3-50 species of simple minerals as known to him; and no less than 82 had been found on Vesuvius before the end of the year 1825." Many of these are peculiar to that locality. (ii. 92.) The flora of Vesuvius is also peculiar in Italy, embracing several *Euphorbiaceæ* and other plants not found elsewhere in that peninsula. The greater part of the mountain has, indeed, a bare and rugged aspect; but around its base, as previously stated, is an extremely fertile and picturesque region, teeming with plantations, villages, and white country-houses. The land here is divided into small farms of 5 or 6 acres, supporting each a whole family, and the pop. is estimated at not less than 5,000 persons to a sq. league. The land is cultivated, like a garden, with the spade; and yields three crops a year, without fallows or manure. The proprietor of the soil usually receives two thirds of the gross produce in kind for his rent. The leases are long, and the intercourse between farmer and tenant is generally mild and liberal. It is on the slope of Vesuvius that the *Lycyrea Christi* is grown. This, which is a red luscious wine, is better known by name than in reality, very little of it being produced, and that little being principally reserved for the royal collars. The *vino Greco* and the muscadine wines of Vesuvius, are also deservedly celebrated (*Sirmond's Italy*, pp. 421, 422.; *Henderson on Wine*, p. 210.)

Vesuvius, being so near Naples, is usually visited by stranger, resorting to that city. M. Simond gives the following notice of his ascent to the mountain in 1818:—"We left Portici, ascending gradually among cultivated fields and vineyards occasionally traversed by streams of old lava, black, rough, and sterile; and in 1½ hour reached the Hermitage, a convent where a few monks keep a sort of inn for the visitors of Vesuvius. Further up, we traversed large fields of lava, extremely rough; and at the base of the cone, prepared for the ascent over a heap of crumbling ashes and cinders, extremely steep, of course, as it formed an angle of nearly 45°. In about one hour, stoppages included, we found ourselves on extremely hot ground, intolerable to the hand, and fatal to the soles of our shoes; it teemed with hot vapours, and was covered with beautiful efflorescences of sulphur. Smoke issued from numerous crevices; at the entrance of which a piece of paper or a stick took fire in a few seconds; and, what seemed strange, a steam thrown into one of these openings increased the smoke at all the others. Stooping low, we could hear a noise very like that of a liquid boiling. The hard but thin

crust upon which we stood appeared to have settled down in some places; a woeful indication of its hollow state. After a few steps more we came to the edge of a prodigious hole, on the very summit of the cone, being the crater formed by the last eruption, four months previously. This hole was not by any means the tremendous thing we expected,—a fathomless abyss, fiery and black, with lava boiling at the bottom,—but a slope of grey ashes and cinders, much like that by which we had ascended, or scarcely more precipitous, and ending, at the depth of 400 or 500 ft., in a level place, with grey ashes like the rest." The view from the summit is far inferior in extent and magnificence to that from Etna, but is, notwithstanding, extremely various, rich, and beautiful. The whole ascent and descent to and from Naples may be readily accomplished in seven or eight hours. (*Simond's Trav.*, p. 421-423.; *Estiace, Class. Tour*, iii. 25-26.; *Stark's Guide*, &c.)

From the period of the earliest records down to the reign of Titus Vespasian, the volcano seems to have been inactive; the appearance of its crater and the cavernous structure being the only indications by which Strabo conjectured that it might at some distant period have been on fire! But in the first year of the reign of Titus (A. D. 79) the volcano that had so long been dormant burst forth with renewed and tremendous energy, in one of the most destructive eruptions of which history has preserved any account. The large and flourishing cities of Herculaneum and Pompeii, near the sea, were both overwhelmed by its lavas and ashes! Even the figure of the coast was materially changed; and for the space of more than 1,600 years all trace of the buried cities was completely lost, and they were only accidentally discovered in the course of last century. The elder Pliny lost his life during this interval, however, which has been described by the younger Pliny, to whom it was witnessed (*Epist.*, lib. vi. 16 and 20.), and by Tacitus. Lucian, says the latter, *altit atrox et continens tremor terre, quum secuta est horrenda Vesuvii montis conflagratio. Pulcherrima Campanie ora misere fœdita: obruta due urbes Herculaneum et Pompeii: vasta hœc areæ tractus, quos inter priore Agrippa cœsusque mat. Iuxta. At studiorum famæ mors C. Plinii fuit insignis.* (App. Chiron.)

Since the destruction of Herculaneum and Pompeii there have been 45 authenticated eruptions; but, luckily, none of them have been equal to it in destructive power. Of these which happened down to the 12th century, we have few accounts; and from 1138 to 1631 there were but two slight eruptions; during this interval, however, Etna was in a state of great activity, and the formation of Monte Nuovo, &c. in the Phlegæan Fields took place. In 1631 a violent eruption occurred, during which seven streams of lava poured from the crater; and from 1666 to the present time, there has been a series of eruptions, the longest intervals between them having rarely exceeded ten years; the last was in Jan. 1829. The energy of Vesuvius, when in action, is extremely great, and the spectacle highly magnificent and sublime. In the eruption of 1773, Sir W. Hamilton says that jets of liquid lava were thrown up to the height of at least 10,000 ft. having the appearance of a column of fire; and in that of 1793, according to Dr. Clarke, millions of red-hot stones were shot into the air to full half the height of the cone itself, and then falling, fell all round in a line arch, covering nearly half the cone with fire. The lava, however, does not always issue from the crater at the summit, but, as in Etna, sometimes from small cones raised in various parts of the declivity; and occasionally three or four of these cones are in a line, which generally points towards the great crater. The eruptions of 1760, 1794, and 1831, were of this description. (For further details, we beg to refer the reader to Sir W. Hamilton's *Observations on Vesuvius*, and his *Camp Phlegææ*, and to the works of Clarke, Serape, Deffrenoy, &c., with those of Maclaren, Simond, Estiace, Rampoldi, &c.)

VIATKA, a government of the Imperial Russia, chiefly between the 46th and 60th degs. of N. lat., and the 46th and 54th of E. long, having N. Volodga, E. Perm, S. Oreloug and Kasan, and W. Nijni-Novgorod, and Kostroma. Area, estimated at about 92,500 sq. m. Pop., in 1858, 1,511,600. The slope of the country is towards the W. and S., in which directions the Viatka, a tributary of the Volga, flows, traversing the government nearly in its centre. The Kama, which forms part of its E. and S. boundaries, also rises in this gov. Surface generally undulating, and even mountainous towards the E., where it consists of the lower Ouraltian ranges. The soil is mostly good, though encumbered in parts with extensive marshes. Climate severe in winter, but not usually unhealthy. Agriculture is the principal occupation of the inhab., particularly along the banks of the large rivers; and in ordinary years an excess of corn is grown. Rye, barley, and oats, are the principal grains; very little wheat is raised, but pence, lentils, and buckwheat, are grown, with large quantities of hemp and flax. The surplus produce goes chiefly to the N. Russian

\* Lyell says:—"The escapement of Somma exhibits a structure perfectly similar to that of the cone of Vesuvius. The principal point of difference consists in the greater abundance in the older cones. (*Principles of Geology*, ii. 89.; iii. 5-3.) But it appears from Mr. Maclaren that later discoveries have been made. (*Note*, &c., p. 139.)

provs. Potatoes are not much cultivated. Fruit is not plentiful; apples scarcely ripen. The forests are very extensive, they consist mostly of firs, intermixed with oak, elm, alder, lime, birch, and other trees. Cattle breeding, though a secondary branch of industry, is still of importance; and a good many small but robust horses are reared. Sheep are few. Furs, tar, iron, and copper, are among the chief products. Manufactures, though not extensive, appear to be on the increase: in 1832, there were 62 factories for woollen cloths, linen and cotton stuffs, paper, soap, potash, copper, and iron wares, &c., employing between 6,000 and 7,000 hands. About 2 million archines of woollen, and perhaps nearly double that quantity of linen cloth, are supposed to be annually made in the houses of the peasantry; and large quantities of spirits are distilled. Near Sarapoul is an extensive manufactory of arms, and at Votka anchors, gun carriages, and iron machinery of various kinds are made on a large scale. The government exports corn, flax, linseed, honey, tallow, leather, firs, silk goods, iron, and copper, to Archangel, and corn and timber to Saratof and Astrakhan. It receives manufactured goods from Moscow and Nijni-Novgorod, tea from Irbat, and salt from Perm. Viatka, the cap., is the great emporium of the trade. It is subdivided into 11 districts: Viatka, Slobodskoi, and Sarapoul, being the chief towns. The inhabitants consist of various races; Russians, Votians (of a Finnish stock, and from whom the prov. has its name), Tartars, Bashkirs, Teptians, &c., professing many different religions. The Mohammedans are estimated at nearly 50,000; and the Shamanists and idolaters at 3,500. In 1831, there were only nine public schools, in which, 1,153 pupils were receiving instruction; but the number has since materially increased. This government is united under the same governor-general with Kasan; but the Tartars and Finns are subordinate to the jurisdiction of their own chiefs.

VIATKA, a town of European Russia, cap. of the above gov.; on the Viatka, near the confluence of the Tchepetsa: 230 m. W. by N. Perm, and 250 m. N.E. Nijni-Novgorod. Pop. 6,290. *(Pogodk.)* It has 11 churches, one of which, the cathedral, with a silver altar ornamented with bas-reliefs, cost 130,000 roubles. Here are numerous convents, with an episcopal seminary, gymnasium, and high school, founded in 1829. It was annexed to Russia by Ivan Vasilievitch, about the middle of the 16th century. *(Schultz, La Russie; Poggart, Das Kaiserthum Russland, &c.)*

VICENZA (an. *Vicentia*, or *Victicia*), a city of Austrian Italy, cap. deleg. of its own name, on the Bacchiglione, where it receives the Retrone, 26 m. E.N.E. Verona, and 37 m. W. by N. Venice. Pop. in 1837, 20,688. *(Berghaus.)* Though surrounded by dry moats and dilapidated walls, it is one of the best built cities of Italy. It has an astonishing number of well-designed houses, many of which are of very fine architecture; and even those which are less deserving of praise would, from their number and the richness of their ornaments, produce a great appearance of magnificence in the city, if they were well kept up; but they appear forlorn, neglected, and half uninhabited. *(Wood's Letters, &c. i. 238.)* Vicenza, says Forsyth, "is full of Palladio," the modern Vitruvius, born here in 1514, who has lavished all his skill on his native place. Besides about 20 palaces, the town-house, or *basilica*, the church of Sta. Maria del Monte, the Rotunda, the Olympic triumphal arch leading to the Campo Marzo, the theatre of the Olympic Academy, &c. are the works of this architect. The most celebrated of these is the Olympic Theatre, a noble edifice, constructed upon the plan of the ancient theatres, and bearing a great resemblance in all essential particulars to those of Herculaneum and Pompeii. It is fully described by Eustace, who states that the palatial edifices of Vicenza, though inferior in materials and size to those of Genoa, are much superior in external appearance. *(Class. Tour, i. 132-5.)* The Vicentine villas, which have been often imitated in England, are as beautiful as the larger buildings within the city. Many of them are on the Monte, a pleasant hill adjacent to the town, the favourite resort of the Vicentine gentry, and whence an extensive and rich view is obtained of the great plain of Lombardy. Vicenza has few Roman antiquities, and not many interesting specimens of middle-age architecture. The cathedral has a front exhibiting a mixture of different styles, and its interior presents a nave only, which is of great width; neither the length nor height being in proportion. The church of St. Corona has a fine "Adoration of the Magi," by Paul Veronese; the church of St. Lorenzo is now converted into a barn. All these buildings are in the pointed style, which prevailed in this part of Italy during the 13th century, and of which the church of St. Anastasia at Verona is one of the finest examples. *(Wood's.)* Nine bridges cross the different rivers at Vicenza, one of which, the *Ponte de Sannichele*, is by Palladio, and, according to Rampoldi, may be compared with the *Altato* at Venice.

Vicenza is a bishop's see, the seat of the council, and of the superior courts for the deleg., and has a lyceum, two gymnasiums, an ecclesiastical seminary, and many inferior schools, eleven hospitals and orphan houses, a government pawn-bank, public library, societies of agriculture, &c. The Olympic Academy was founded in 1555, for the encouragement of polite literature, and still, as formerly, includes the most respectable citizens. *(Eustace.)* Some of the palaces have a few fine paintings; but they were mostly carried off by the French.

The Vicentines are said to manifest an aptitude for manufactures; and are, perhaps, inferior in industry only to the inhabs. of Verona. They weave silk and woollen fabrics, and make leather, whalebone articles, earthenware, hats, gold and silver articles, fire-engines, &c., and have a considerable trade in agricultural produce. "As you enter the Vicentine territory," says Mr. Rose, "you may observe a visible improvement in the mode of cultivation. The fields are kept cleaner, and every thing indicates superior industry and exactness. If we except the resemblance of dialect, and some community of trilling customs, Calais and Dover are not more unlike than Padua and Vicenza, long subjected to the same government, and connected by facilities of communication both by land and water. To say nothing of the outward appearances of the two cities, which present a most remarkable contrast, it would seem as if the inhabs. were of different blood,—as if a colony of Venetians, making a knight's move, had leaped over Padua and established themselves at Vicenza." *(Letters from the N. of Italy, i. 154, 155.)*

Vicenza was anciently a Roman *municipium*, but one of little consideration. *(Tacit. Hist., iii. 8.)* It was sacked by Alarie in 401, and successively pillaged by Attila, the Lombards, and the Emperor Frederick II. Early in the 15th century it came into the possession of the Venetians, who held it till the downfall of the republic in 1796.

Napoleon conferred the title of Duke of Vicenza on Caulaincourt. *(Rampoldi; Austr. Nat. Encyc.; Woods; Forsyth; Eustace; &c.)*

VICENÇA, a town of Spain, in Catalonia, prov. Barcelona, in an undulating plain, 36 m. N. Barcelona. Pop. 12,500. *(Mihano.)* It is of a very irregular figure; some parts of it are well built, and 2 of its squares are handsome. The cathedral is very mediocre, and is, indeed, inferior in many respects to the other churches. It has numerous convents, a seminary, college, and several hospitals, with manufactures of linen and hempen fabrics, printed cottons, woollen cloths, hats, and leather. *(Mihano; Diet. Geog.)*

VIENNA (Germ. *Wien*, Lat. *Vindobona*), a city of Germany, cap. of the Austrian Empire, prov. Lower Austria, on an arm of the Danube, where it is joined by the small rivers Wien and Alster, 190 m. E. Munich, 330 m. S.E. Berlin, and 800 m. N.W. Constantinople. Lat. of the observatory, in the centre of the city, 48° 12' 38" N.; long. 16° 22' 45" E. The pop., which in 1815 was about 250,000, had increased, in 1840, including the garrison of about 15,000 men, to 357,527, and may now (1842) be estimated at above 360,000.

The Danube, opposite Vienna, is divided into three or four separate arms, the most southerly of which washes the walls of the city. Between the third and fourth of these arms, however, is the important suburb of Leopoldstadt, with the Prater, the Augarten, and several other favourite promenades. This part of Vienna communicates with the city and the suburbs on the S. side of the Danube by five bridges, of which the Ferdinands Bruehe, in the centre, is the chief. Vienna stands in a plain, elevated about 520 feet above the level of the sea; but so little above that of the Danube in this part of its course, that, with the exception of its S. extremity, which is on the gradual ascent to the heights of Kahlenberg, most part of the city is liable to inundations. Vienna is of a nearly circular form, being about 10 m. in circ. The city-proper, in the centre, is, however, scarcely 3 m. round. It is enclosed by ramparts of brickwork, and a beautiful glacis from 2 to 3 furlongs broad, planted with trees, laid out in public walks, forming, like the parks in London, the lungs of the metropolis; these separate the city from its numerous suburbs, which, on the S. side of the Danube, are again enclosed by a line of ramparts, originally thrown up in 1703, where the passports of travellers are demanded.

Vienna, from its size, wealth, population, and activity, deserves to be compared with London and Paris better than any other European capital. Its chief points of external difference from these cities are that it preserves about 10 more antique grandeur, and that it is the old and not the new parts of the town which form the fashionable quarters. Most part of the principal edifices are within the city, where the houses are usually four or five stories high, and the streets irregular, narrow, and dark; but where the Imperial family and most of the nobility reside. Nearly all the best shops, principal hotels, &c., are also in this quarter. In the suburbs, however, are several of the pa-

laces and garden-villas of the higher nobility, including those of Princes Liechtenstein, Esterhazy, Schwarzenberg, Anersberg, Metternich, &c.; the Belvidere Palace, built by Prince Eugene, but appropriated by Joseph II. to the imperial picture gallery, and other public institutions; with immense barracks, magazines, and other military establishments, hospitals, &c. The streets in the suburbs are generally broad and straight; but some of them, being unpaved, are in wet weather dirty and muddy. The thoroughfares in the city—proper are, on the contrary, uniformly clean, and well paved; but no part of the capital has as yet the advantage of foot-paths.

The houses, both in the city and suburbs, are in general huge edifices, and, as in Paris, are built around courtyards, and occupied by many different families. Some of these dwellings are of enormous extent, and quite towns in themselves. Prince Esterhazy has one comprising 150 different sets of apartments, and yielding a revenue of 1,600L to 2,000L a year; and one belonging to the Stahrenberg family is said to be inhabited by 2,000 persons, and to produce a rental of 4,000L a year! (*Russell, Tour in Germany.*) The Burger Hospital, formerly an hospital for citizens, was converted by Joseph II. into a dwelling-house: it is 6 stories high, has 10 courts and 20 staircases; and several other houses are of equally colossal dimensions. No city in Europe has so large a number of resident nobility as Vienna: 24 families of princes, 70 of counts, and 60 of barons make it their home for the greater part of the year. These nobles may perhaps have fortunes of from 100,000 to 500,000 florins a year, and several, as Prince Esterhazy, Liechtenstein, &c., considerably more. Here, also, many private gentlemen spend 50,000 florins a year; and, with the exception of those of London, the citizens of Vienna are the richest in the world. Berlin and Dresden may, perhaps, have more cornices, pillars, and handsome public buildings, and in Munich and Paris these may have a more imposing effect, but in none of these capitals are there so many noble and extensive private edifices. The Herrengasse and other streets near the imperial residence are full of palaces of the higher nobility. These, as in London, frequently extend along narrow thoroughfares, and are not distinguished from humbler residences except by their greater size and elevation; their interiors are sumptuous.

Nearly all the so-called squares of Vienna are within the city. They are irregular, and comparatively small open spaces, none being so large as Waterloo Place; the cathedral stands in the centre of St. Stephen's platz, and the Graben is an incessant thoroughfare, and may be looked upon as the Charing Cross or Mansion House Place of Vienna. Most of these open spaces are ornamented with one or more monuments, or fountains. These, however, are not always in good taste. In the Joseph platz is a fine equestrian statue of Joseph II., by Zanner. "The emperor, the resemblance to whom is said to be very striking, is attired in the Roman costume, and crowned with laurel; with one hand he curbs the impetuosity of his steed, and the other he extends to his people. The statue reposes on an elevated pedestal of granite, bearing the inscription *Saluti publice viri non diti sed totius*; and which, with its attendant pilasters, are adorned with medallions, representing, not the remarkable events of his life, but his travels! It was erected by the late emperor, Francis II." (*Spencer's Germany*, &c., ii. 134.) But, except this, Vienna has no other statue of her great men or benefactors; there is none of Montecucculi, Prince Eugene, Lacy, Laudohn, Louis of Baden, or John Sobieski; none of Daun or Kaunitz, Von Swieten, Mozart, or Haydn. In respect of such memorials, Berlin, and even London, are far before Vienna. In her bridges Vienna is also immeasurably behind London and Paris, having none worth notice. The Danube is here nowhere much more than 60 yards across; being, also, a sluggish and muddy, though a navigable stream. The Wien is little better than a mere filthy ditch. The drainage of the town is effected by good underground sewers.

**Public Buildings, &c.**—The chief of these is the cathedral of St. Stephen, almost in the centre of the city, and from which the principal thoroughfares diverge. It is an elegant Gothic building, ranking in elevation and richness of architecture with the cathedrals of Strasburg and Antwerp. Its length is 350 ft., and its greatest breadth 220 ft. Flanking its great W. doorway are two towers, the remains of the original church, constructed in 1163; and at the angles of this front are two magnificent piles of a similar kind, though only the most southerly has been finished. This tower and spire is 450 ft. in height, or barely 16 ft. lower than that of Strasburg; it has a bell weighing 357 cwt., cast from cannon taken from the Turks, and declines towards the N. about 3 ft. from the perpendicular. The exterior of the cathedral has a good deal of tracery. Within are some good wooden carving, a few good pictures, the monuments of Prince Eugene, the emperor Frederick III., &c., and a

gorgeous chapel of the Liechtenstein family; but, on the whole, its interior is but little decorated. A crypt beneath it served for 8 centuries as the burial-place of the imperial family: at present, however, only parts of their viscera are preserved here; their hearts being deposited in the Augustine church, and the rest of their bodges in that of the Capuchins. The church of the Angelines is one of the handsomest in Vienna, and contains the monument of the archduchess Christine, one of the finest works of Canova; besides those of Leopold II., Daun, Von Swieten, &c. The church of St. Charles Borromeo is an imposing edifice, in the Byzantine style; Metastasio is buried in that of St. Michael, and the Carmelite church has some fine stained glass. Vienna has, in all, nearly 60 churches, a third part of which are in the city; 17 conventual establishments, a Scotch Lutheran, 3 Greek churches, and 2 synagogues.

The Burg, or imperial palace, occupies a large extent of ground in the S.W. quarter of the city. It is externally a gloomy and shapeless congeries of buildings, erected from the 14th to the 17th century, on a par. Mr. Spencer says, in point of architecture, with St. James's. It comprises extensive suites of rooms; though these, in the simplicity of their furniture and decorations, show the unostentatious habits of the Austrian princes. The state-apartments, with their ancient gilding, and faded velvet hangings, remain in the same condition as in the time of Maria Theresa. But the palace has some fine collections in art and science. The imperial library, which comprised, according to Balbi, in 1835, 284,000 printed volumes, and 16,000 MSS., is placed in a handsome edifice built for the emperor Charles VI., whose statue, with that of many other Austrian monarchs, is placed in the centre of the grand hall, an apartment 240 ft. in length, by 45 ft. in width and 62 ft. in height, with a fine dome rising 30 ft. above the ceiling. The library increases by about 3,500 vols. a year, a copy of every work published in the empire being deposited here; besides which, a fund of nearly 2,000L a year is spent in the purchase of new works. This library is open to the public without introduction for five hours a day. It has, among other curiosities, an act of the Roman senate prohibiting the *bacchanalia*, engraved on bronze, and bearing date A. V. C. 577 (or B. C. 180); the 5th decade of Livy, a unique MS.; the Peutingerian Table, a military map of the Roman empire in the 4th century; several MSS. of succeeding centuries, the earliest book printed with a date; the MSS. of the *Gerusalemme Liberata*, &c. Here, also, are collections of music and engravings, the last comprising about 300,000 pieces. The museum of antiquities comprises a cabinet of medals, second only to that of Paris, and an unrivalled collection of intaglios and cameos. One of the latter, representing the apotheosis of Augustus on an enormous sardonyx, is supposed to be the finest existing; and the coins and medals amount to 80,000, including 18,000 Greek, and 23,000 Roman. (*Turner; Murray's Handbook.*) The collection of ancient sculpture is far inferior to the collections of either Dresden or Munich; but there are excellent museums of natural history and botany, and the cabinet of minerals surpasses every other in Europe. Here are also Egyptian and Brazilian museums, a good collection of Greek vases, and the imperial jewel-office; in which, including a number of relics, are the Austrian and Hungarian regalia, the Florentine diamond, the iron crown, sceptre, &c. of Charlemagne, the sword of Tamerlane, &c.

The Belvidere Palace is appropriated to the Ambras museum, and to one of the finest collections of paintings in Europe, being especially rich in works of the Flemish and German schools. The Ambras museum, formed late in the 16th century, includes, besides other curiosities, a most interesting historical collection of armour. The paintings in the Imperial gallery are divided into separate rooms, according to schools. In those of the Italian schools are the famous *Ecc Homo* of Titian, formerly belonging to Charles I. of England; a superb Holy Family by Raphael; many other pictures by these artists, and by P. Veronese, the Caracci, S. Rosa, &c. In those of the Flemish school are three masterpieces by Rubens: St. Ignatius driving out evil spirits; St. Ildefonso; St. Ambrosius closing the church door at Milan against the Emperor Theodosius; some of the best works of Rembrandt and Van Dyck; and pictures by Teniers, Cuyp, G. Dow, &c. Other rooms are appropriated to the German, Austrian, and Spanish schools, works of the middle ages, and a comparative series of Italian paintings from the 14th to the 19th century. In the Belvidere gallery is the mosaic copy of Da Vinci's Last Supper, for which Napoleon engaged to pay 15,000 zechlins, and which was afterwards bought for the same sum by the late Emperor Francis II. "At Dresden," says Mr. Turnbull, "the gallery comprises perhaps the grandest ensemble in Europe, but is so neglected, so involved in gloom and dirt, as to afford too often a feeling more akin to pain than to pleasure. At Berlin, the condition, care, and arrangement, are perfect, but the works

themselves are rarely first-rate specimens. The gallery of Vienna is good alike in intrinsic excellence, in order, and in condition. Of the museums generally, as, indeed, of most of the institutions under the Austrian government, the high and eminent excellence is their admirable adaptation to practical utility. In those of other countries we had seen articles of greater individual rarity; entire assemblages of certain branches, more copious and complete; but in no one were the various objects, to our apprehension, so ably and lucidly arranged, labelled, described, and exhibited, as at Vienna; and this, too, in a city where space and light are so defective. They are fully exhibited to the public, during a convenient number of hours; and the student has ample opportunity of following up his researches therein, in connexion with lectures gratuitously afforded on the principal branches of science." (*Turnbull's Austria*, i. 236-238.)

The Imperial arsenal has one of the richest armouries in Europe. In the upper rooms 150,000 stand of arms are kept; and, besides a large store of weapons and armour of different dates, we have here the buff coat worn by Gustavus Adolphus at the battle of Lutzen, the arms of Marlborough, Eugene, Stahremberg, and Montecuccoli, numerous standards, the enormous chain of mail across the Danube by the Turks in 1529, &c. The city arsenal is a fine building, constructed by the citizens at their own expense, and has, with many curiosities similar to the above, arms sufficient for 25,000 civic guards. The Imperial riding-school is also a handsome edifice by Fischer of Erlach, but lost among the buildings of the palace. The Royal Stallung, in the smooth facing the Burg-theater, is a noble palace appropriated to the Royal Hungarian guard.

Vienna has five theatres; the principal are, the Hof-theatre attached to the palace, and that at the Kärnthner-theater (*Carinthian-gate*). The first is devoted solely to the performance of the regular German drama; and, though not the largest, is by far the finest theatre in Vienna. It is both clean and well lighted, and is said somewhat to resemble Drury Lane. The acting here is at least equal to that at Berlin and the performers have, after ten years' service, a handsome pension settled on them for life by the government, with an annuity after their death for their widows. (*Strang's Germany*, ii. 253.) The Kärnthner-theater is the opera-house of Vienna, and the singers and orchestra are unsurpassed in Germany. This house is very large, having six complete rows of boxes and a half circle next the pit; but the largest theatre is one on the Wien, appropriated to equestrian pieces. The really national theatre of the Viennese is the *Beym Casper*, in the Leopoldstadt. This theatre, the Adelphi or *Amberg Comique* of Vienna, is appropriated to farces, and is the arena on which the national character is painted in the most lively colours and broadest manner. Here, says Mr. Strang, one circumstance is noticeable, as indicative of the power of "the million," even in Austria. The police, though exceedingly strict in the regular theatres, are said to wink hard at the political jokes that are frequently cracked on this stage; while the pulse of the public is not infrequently felt here, by somewhat the same means as the old Council of Ten used to adopt at Venice, through the tricks and colloquies of Punchinello. (*Germany in 1831*, ii. 255, 256.)

Vienna has several handsome gates, the chief of which is the Burg-theater, near the palace; but none is comparable for magnificence to the Brandenburg gate, Berlin. Indeed, every object brought under public observation appears externally more splendid, elegant, and attractive in the Prussian capital; "yet it is merely as shadow to substance, for in Vienna, behind dark walls, there is far more sterling value than in the finest palaces of its rival." (*Spencer's Germany*, &c. ii. 138.)

*Schools, Libraries, &c.*—Vienna has a university, founded in 1257, but which was wholly remodelled by Von Swarczen in the time of Maria Theresa. It is celebrated on the Continent as a school of medicine, and is probably attended by a greater number of students than any other German university, except that of Berlin: in 1832 it had 1,519 students, of whom 209 studied divinity, 322 law, 519 medicine and surgery, and 450 philosophy, &c. (*Journal of Education*, vol. ix.) There are between 70 and 80 professors, all of whom are paid by government, and are neither permitted to receive fees on their own account, nor to give private lessons. The theological, surgical, and veterinary courses are delivered gratuitously; but the student has to pay a fee of 18 flor. (about 11. 11s. 6d.) for attendance on the lectures in philosophy, and of 30 flor. (2l. 12s. 6d.) for attending those in medicine and jurisprudence. The whole amount of the moneys thus paid for tuition during the session is expended in stipends to indigent students, and divided among them, without reference to their religious creeds, in allowances varying from 50 to 150 flor. (4l. 10s. to 13l. 10s.). Nearly all the lectures are delivered in the German language. The university has a library of above 100,000 vols., and 1500.

a year is expended in the purchase of new works, and it receives, gratis, a copy of all works printed in Lower Austria. (*Journal of Education*, 1834; *Statistical Journal*, 1841.) An observatory, and a botanic garden, are attached to this establishment.

The Polytechnic Institute, a handsome structure facing the glacis, was founded by the Emperor Francis in 1816, to afford instruction in the practical sciences, arts, and commerce; and a few years since had about 750 pupils and 35 masters. Besides the ordinary branches of knowledge, the pupils are taught the history of commerce, the knowledge of merchandize, mercantile law, and correspondence, natural history and chemistry as applied to commerce, drawing, mathematics, &c., for which instruction the pupils pay only 3 fl. a month, and, for a small extra sum, are taught Latin, English, French, and Italian. Among other collections, this school has a museum of the products of arts and manufactures, both Austrian and foreign, and a valuable library. The *Theatresium*, for the sons of the aristocracy, and the normal school of St. Anne, were both established by Maria Theresa. The former was suppressed by Joseph II., but restored by Francis; and it has now a library of 30,000 printed vols., besides MSS. and pamphlets. Joseph II. established both the Oriental Academy and the *Josephinum*; the latter, an institution for the education of army surgeons, which has attached to it an hospital capable of receiving 1,200 patients, a collection of anatomical figures in wax, by Fontana, &c. Besides these establishments, Vienna has a special seminary for the education of the secular clergy, a Protestant seminary, founded in 1821; 6 military colleges, with nearly 1,000, and 49 minor establishments for military education, with nearly 3,000 pupils; an academy of the fine arts for about 1,300, and a normal academy for 200 students; besides about 60 inferior public schools. (*Journal of Educ.*, &c.) In addition to the libraries already mentioned, the Archduke Charles has one of 25,000 vols., Prince Liechtenstein of 40,000, Prince Metternich of 23,000 do., Prince Esterhazy of 20,000 exclusive of many inferior collections. But with all these appliances for knowledge, Vienna cannot be considered so much a resort of learners as of the fine arts. In paintings she is, perhaps, the richest capital of Europe. The gallery of Prince Liechtenstein consists of 25 splendid apartments, filled with exquisite originals of the Italian, Flemish, French, and Dutch masters, including *chefs d'œuvre* of Raphael, Guido, Rubens, Vandeyck, Dominichino, Guercino, Claude, S. Rosa, Carlo Dolce, &c. The Esterhazy gallery contains upwards of 600 pictures, of which 54 are by Spanish masters, whose works are rarely found out of Spain; with a collection of sculptures, including works by Canova and Thorwaldsen; 50,000 engravings, &c. Counts Czernin, Schönborn, Harrach, Lamberg, and many other noblemen, have collections of choice paintings; and in the palace of the Archduke Charles is a collection of 160,000 engravings. The foregoing galleries are all open to the public at stated times. (*Baile's Essai sur les Bibliothèques de Vienne*, pp. 81-113.)

In statuary, also (though not in public statues of celebrated men), Vienna is very rich. Canova's group of Theseus killing the Centaur deserves especial mention. It was originally intended by Napoleon to surmount the grand arch at Milan, but is now placed in the Theseum, a Doric temple, on the Volks-garten, in imitation of the temple of Theseus at Athens. "This group is of Carrara marble. The hero is in the act of grasping with his left hand the throat of the Centaur; while his right arm, raised behind his helmeted head, clenches the club with which he prepares to inflict the fatal blow. The whole character of the group is in Canova's most effectively style." (*Turnbull*, i. 212.)

*Hospitals and other Charities.*—Few capitals are so abundantly furnished with charitable institutions as Vienna. Many of the principal, as the general hospital, House of Invalids, deaf and dumb asylum, &c., were founded by Joseph II. The general hospital is a vast building, ranged around 7 quadrangles, having 2,500 beds. It is said to receive annually from 10,000 to 16,000 patients. It partly answers the purpose of a sanatorium, there being separate bed-rooms, which, with much attendance, and every comfort necessary for an invalid, are within the reach of persons of limited income, on the payment of a small sum daily. The hospital of the Charitable Brethren, supported partly by voluntary contributions, is a monastic establishment, but open equally to Jews, Turks, and Christians of all persuasions. The House of Invalids is similar in its kind to Chelsea Hospital, having been founded for 800 old soldiers. In its great hall are two large pictures of the Battles of Lepanto and Aspern. The Deaf and Dumb Asylum is well conducted; and those among the pupils who evince intelligence are often

\* It may be remarked here, that there is an increasing tendency towards religious toleration in Vienna at least in the Austrian government. Mr. Strang believes that there is a disposition on the part of those in power in Austria to tolerate every kind of religious belief, provided it be not accompanied with offensive sectarian zeal.

afterwards employed in state affairs requiring secrecy. There are schools for the blind, &c., and a lunatic asylum, which is, however, said to be not so well conducted as most of the other public establishments. Attached to the General Hospital are the *maison d'accouchement* and foundling hospital. In the former of these "not even the name of the applicant is demanded; she may enter veiled or masked, and remain incog. the whole time she continues in the house; she has merely to deliver a sealed paper to the superintendent, containing her name and real address, that, in the event of death ensuing, her relations may be apprised of her fate." (*Spencer*, 163.) The person who brings a child to the Foundling Hospital receives a ticket, by presenting which, the child may at any time be reclaimed: if it be not taken away, it is, at the proper age, brought up to some employment. It is probable that an institution of this kind may prevent a few cases of infanticide; but the mortality in this, as in all similar institutions, is quite excessive, and there can be no doubt that it acts as a powerful incentive to vice and immorality.

*Commerce, Hotels, Shops, &c.*—Vienna is the great emporium of the Austrian provinces. N. of the Alps, and an important *dépôt* for the interchange of goods between E. and W. Europe. According to Becker, there were in Vienna, in 1834, 547 silk and velvet, and 340 cotton cloth manufacturers; 24 cotton-printing establishments, and many cotton mills. The porcelain manufacture of Vienna is among the most celebrated on the continent, and it has an imperial cannon foundry, and a manufacture of small arms, said to employ 500 workmen. Cutlery, watches, and jewellery, bronze and other metallic goods, meerschaum pipes, musical instruments, paper, chemical products, gloves, leather, hosiery, chocolate, and liqueurs, are among the other principal products: it has several large printers and music engravers. Many of the most wealthy mercantile houses belong to Greeks. The National Bank of Vienna, established during the Seven Years' War, is divided into 51,620 shares. In 1837 it made a net profit of 3,943,293 florins, being at the rate of 77 florins a share. It discounts, advances money on pledges, negotiates bills of exchange, &c., and is said to be very well managed.

The hotels are of two classes: living in those of first-rate excellence costs about one third more than in Paris; but those of the second class are very good of their kind. Lodgings are twice as dear in the city as in the suburbs, where a room tolerably furnished may be had for 6 fl. a month. The *cafés* of this city are not decorated with the same splendour as those of Paris, but they are quite as much frequented, being resorted to in the evenings by both sexes of the middle classes, and at other times by gentlemen to play at billiards, or to smoke, which is not permitted in the streets. (*Murray's Hand-Book*, &c.)

From their number being limited by government, the profits realised in the coffee-houses are great, and they frequently bear a value so high, that Russell has seen one on the Graben, for the privilege of belonging to which a purchaser paid upwards of 300 fl. in addition to an extravagant price for the house itself. (ii. 215.) Vienna is well supplied with provisions of all kinds, which are generally cheap. House rent is said to be lower than in Paris: servants' wages are much less; furniture is still cheaper; and a pair of good Hungarian carriage horses, the keep of which will cost about 300 l. a year, may be bought for 400 l. "No town exhibits such an appearance of people living amidst plenty, such an absence of *uncasy classes*, and of any thing that can represent poverty. The hackney coaches are as neat, clean, and showy as private carriages; the horses are generally in excellent condition. The shops, though in such narrow streets, are as *dashing* as those of London or Paris; and most of them have signs, with paintings almost worthy of museums. The book-sellers' and picture shops are numerous and large; and besides the literature of every state in Germany, you may find many popular books and the principal engravings published in England and France." (*Austria and the Austrians*, i. 49, 50.)

*Parks, Amusements, &c.*—The principal amusements of the Viennese are music, dancing, the theatres, and frequenting the Prater and other fine promenades which encircle the city. The Prater, the Hyde Park or Champs Elysées of this capital, is handsomer than either, and may in fact be considered the finest public park in Europe. It is nearly 4 m. in length by half as much in breadth, being enclosed between 2 arms of the Danube. Besides the fashionable drives, the Prater contains a great number of coffee and ice houses, pavilions, shows, &c., and is generally filled with a throng of people, particularly on Sundays and holidays. The glacié is studded in a similar manner with places of entertainment, and the Augarten and Britten-au, both N. of the Danube, and the Volksgarten, within the city, are promenades in much the same style. The dancing saloons, or public ball rooms, are not in general what can be called *fashionable* places of amusement, though the imperial family and higher nobility attend the

balls in the *Redoutensaal* at the carnival and other times. They are, however, resorted to by great numbers of the middle and also of the upper classes, and one of the principal, the *Apolló Saal*, can accommodate with ease 10,000 persons. The music here is of a superior order, the celebrated bands of Strauss and Lanner, and others, little inferior, being constantly engaged. Mr. Russell says, "The Viennese take to themselves the reputation of being the most musical public in Europe, and this is the only part of their character about which they display much jealousy or anxiety. So long as it is granted that they can produce among their citizens a greater number of decent performers on the violin or piano than any other capital, they have no earthly objection to have it said that they can likewise produce a greater number of blockheads and debauchees." (*Tour*, &c., ii. 271.) Nearly all the greatest modern composers, Mozart, Haydn, Beethoven, Gluck, &c., have composed their best works in or near Vienna.

*Morals, &c.*—Vienna has acquired the character of being the most dissolute capital in Europe. But without stopping to inquire whether it be entitled to this distinction, it is, at all events, a most agreeable place for a stranger. A liveliness and *bonhomie* pervades society; in bustle and activity Vienna rivals London and Paris; and the pursuit of pleasure appears one of the main occupations of the great mass of the inhabitants. The peace of the city is preserved with the utmost care. The arrivals, departures, residences, &c. of strangers are carefully noted; passports are strictly examined, and great care is taken that visitors shall show that they have the means of paying their way. With residents, however, the police interfere but little, and never obtrusively. Among the drawbacks on a residence here are, the furious driving in the crowded thoroughfares, through which pedestrians have to wind their way among heaps of fuel, the howling of which is incessantly carried on before the doors of the houses; the great variability of the climate, and the indifference of the warts.

Vienna is an archbishop's see, the residence of the Protestant superintendent for all the S.W. provs. of the empire, the seat of the archiepiscopal tribunals, and central bureaux of the Austrian dom., of the court of appeal for the archdiocese of Austria, and the provincial government of the prov. below the Enns. Though not in general famous as a seat of literature, it has, among many other associations, a literary society; of which Von Hammer, the Orientalist, the poet Grillparzer, the historian Mailath, the novelist Caroline Pichler, the mineralogist Mohs, Balbi, &c., are members. Such is the influence of the censorship, that the city produces only two newspapers, and those worth little or nothing, with a few weekly scientific and fashionable papers, a monthly and a quarterly journal. The upper classes speak English, French, and Italian almost as well as their native language; and the *Times*, *Galignani's Messenger*, the *Edinburgh* and *Quarterly Reviews*, *Athenaeum*, and other British and foreign journals, may be had with but little difficulty.

The *curious* are picturesque, but the roads around are very bad. About 2 m. from the city is Schönbrunn, the favourite summer residence of the emperor. It stands in a large park, stocked with deer and game of all kinds. The palace, built by Maria Theresa, is a vast monotonous pile, but richly furnished, and possesses many interesting portraits of the Imperial family. It was twice occupied by Napoleon: the treaty of Schönbrunn was signed in it in 1809, and here the Duke of Reichstadt, son of Napoleon, died in 1832. In the grounds are the *Glacette*, a large columnar temple, from which a fine view is obtained; a menagerie, a splendid botanic conservatory and gardens, with eating-houses, music and dancing-rooms, &c. for the public. Not far from Schönbrunn are Laxenburg, Brühl, Baden, &c., frequented by pleasure parties from the metropolis, in much the same way as Richmond, Greenwich, or St. Cloud.

*History.*—Vindobona was remarkable in antiquity as the place where Marcus Aurelius expired. It was successively taken by the Goths and the Huns, and subsequently by Charlemagne, who placed it under the government of the margraves of the E. part of his dom., thence called *Oester-reich*, and Austria. The margraves, afterwards dukes, held Vienna till the middle of the 13th century, soon after which it came into the possession of house of Hapsburg. In 1541, it was taken by the Hungarians, whose king, Matthias, made it the seat of his court. Since the time of Maximilian I., it has been the usual residence of the archdukes of Austria, and emperors of Germany. It was besieged by the Turks in 1529 and 1683: on the first occasion it was relieved by Charles V., and on the second by John Sobieski of Poland, who totally defeated the enemy beneath its walls. In 1619 it was unsuccessfully blockaded by the Bohemian Protestants. In 1797, it was threatened by the French, but its siege was averted by the peace of Leoben. The

French took it, however, in 1806 and 1809. The congress which parcelled out Europe into its modern subdivisions sat here from the 3d Nov. 1814 to the 9th June 1815. It suffered greatly from the cholera in 1831 and 1832. (*Pezzl, Beschreibung von Wien; Berghaus; Oesterr. Nat. Encyc.; Austria and the Austrians*, vol. i.; *Russell's Tour in Germany*, ii. 217-330.; *Turnbull's Austria*, i.; *Spencer's Germ. and the Germans*, ii. 124-190.; *Strang's Germany* in 1831, ii. 225-353., &c.)

VIENNE, a dep. of France, reg. W., principally between the 46th and 47th degs. of N. lat., and long. 0° and 1° E., having N. Indre-et-Loire, E. Indre, S.E. Haute-Vienne, S. Charente, and W. Deux-Sèvres. Area, 676,000 hectares. Pop., in 1836, 282,731. It derives its name from the river Vienne, an *Vigenna*, which rises in the dep. Creuse, and after traversing Haute-Vienne, a part of Charente, Vienne, and Indre-et-Loire, at first in a W. and afterwards in a N. direction, enters the Loire after a lengthened course. Its principal affluents are the Thorion, Issoire, and Creuse from the E., and the Briance, Valre, and Clain from the S. and W. Limoges, Confolens, Châtelerault, Châlon, &c., are on its banks. Nearly all the other rivers of the dep. are tributaries of the Vienne or of its affluents. Surface, mostly level; but in the S., a chain of heights separates the basin of the Loire from that of the Charente. The soil in the level ground is moderately good, but in the S. it is thin and chalky. In 1834, the arable lands were estimated to comprise 413,131 hectares; pastures, 42,732 do.; vineyards, 28,744 do.; woods, 80,372 do.; and heaths, wastes, &c., 75,167 do. Wheat and oats are the grains principally cultivated: rye and millet are raised for home consumption; but in years of scarcity, chestnuts are a principal resource of the pop. From 500,000 to 700,000 hectol. wine are annually produced; but, on the whole, its quality is inferior, and large quantities are converted into *cognac-de-vie*, frequently of great excellence. The white wines are the most extensively produced; the red wines are generally *très-colorés, durs, et durs*; *ils se gardent long-temps, et s'améliorent en vieillissant: on en a vu qui conservaient encore leur qualité au bout de 40 ans.* (*Jullien*, p. 150.) A good many cattle are reared, and the sheep in some of the cantons are said to be of a superior kind: the produce of wool is estimated at 400,000 kilogr. a year. About 45,000 hogs are said to be annually exported from this dep., by way of the Atlantic ports. Bees and poultry are extensively reared. In 1835, of 120,518 properties, subject to the *contrib. foncière*, 72,589 were assessed at less than 5 fr., and 16,675 at from 5 to 10 fr.: the number of those assessed at 1,000 fr., or upwards, was only 46. The vicinity of Châtelerault produces very superior lithographic stone; and marble, whetstone, millstone, &c. are found in other parts of the dep. Some iron mines are wrought, and there are numerous iron forges. Châtelerault has rather extensive manufactures of fire-arms; and cutlery, lace, coarse woollen cloths and woollen yarn, paper, furs and skins, biscuits, beer, and vinegar are among the other goods made in Vienne. This dep. is divided into 5 arrond.; chief towns, Poitiers, the cap., Châtelerault, Civray, Loudon, and Montmorillon. It sends 5 mems. to the Chamber of Deputies. Registered electors, in 1834-39, 1,799. Total public revenue, in 1831, 5,012,262 fr. According to the *Dict. Géog.*, "*L'instruction est avancée dans ce pays. Le caractère dominant des habitants paraît être l'insouciance et l'indolence; ils sont inégalement attachés aux usages, et aux préjugés de leurs pères.*" (*Hugo*, art. *Vienne*; *Dict. Géographique*, &c.)

VIENNE (an. *Vienna*), a town of France, dep. Isère, cap. arrond., on the Rhone, where it is joined by the Gère, the former being here crossed by a suspension bridge, 16 m. S. by E. Lyons. Pop., in 1836, 14,000 or, including its com., 16,494. "Vienne, situated under a high cliff, with the castle upon its summit, is a striking and beautiful object in descending the river; and after passing it, there is a perfect union of the beautiful and the picturesque in its scenery. It is here also, about 1½ league after passing Vienne, that the vineyards lie so celebrated for their produce of *Cote-rotie*." (*Inglish's Switzerland*, &c. 179.) A handsome quay stretches along the Rhone; and the lower part of the town, on the high road between Lyons and Marseilles, has broad and well-built streets; but the rest of the thoroughfares, along the narrow valley of the Gère, and up steep declivities, are ill laid out, and lined generally with mean houses.

Vienne has several remains of Roman buildings and other antiquities. In the centre of the town is a temple anciently dedicated to Augustus and Livia, having a good deal of resemblance to the *Maison carrée* at Nîmes, though not in such good preservation. It has been used for a church, a club-house, and a tribunal of commerce, and is now appropriated to a museum of antiquities. Outside the town, and in much better preservation, is a pyramidal monument nearly 45 ft. in height, and apparently a tomb. The traces of a bridge across the

exlat. Here, also, are several middle-age antiquities, among which is the cathedral, considered one of the best Gothic edifices in France. It stands in an elevated position; its grand entrance is ornamented with sculptures, and flanked by two high towers; the roof is supported by 48 lofty columns in the interior; the galleries have Gothic balustrades; and it has a fine monument of one of the archbishops of Vienne. The church of an ancient abbey is also worth notice. The other principal buildings are the cavalry barracks, college, hospital, work-house, corn exchange, abattoir, and public library with 14,000 vols.

Vienne has manufactures of woollen cloths, pasteboard, iron and copper plates, &c.; and near it are some argentiferous lead mines producing about 1,500 quintals a year of metal. It was anciently a city of consequence, having been successively the cap. of the Allobroges; of its prov. in Narbonne Gaul, under the Romans; and of the first and second kingdoms of Burgundy; and in the early ages of Christianity, it was the see of the archbishop, primate of Gaul. It was united with Dauphiny to the French dom. by Louis XI. The famous council, held in 1311, which abolished the order of the Templars, met in this town. (*Hugo*, art. *Isère*; *Dict. Géog.*, &c.)

VIENNE (HAUTE), a dep. of France, reg. W., between lat. 45° 25' and 46° 25' N., and long. 0° 35' and 1° 45' E., having N.W. and N. Vienne and Indre; E., Creuse; S.E., Corrèze; S.W., Dordogne; and W., Charente. Area, 551,266 hectares. Pop., in 1836, 285,130. The surface is hilly, particularly in the E., and the mean elevation of the dep. is estimated at between 1,800 and 1,900 ft. above the level of the sea. The rivers, the principal of which are the Vienne (see previous art.) and the Gartempe, with their tributaries, have generally a W. direction. The soil, being mostly composed of the debris of granite and other primary rocks, is, in general, of inferior fertility. In 1834, the arable lands were estimated to comprise 213,351 hectares; pastures, 129,599 do.; woods, 38,588 do.; and heaths, wastes, &c., 93,214 do. Wheat is but little grown; its place being supplied by rye, buckwheat, chestnuts, and potatoes. Very little wine is grown. The pasture lands are comparatively good; and, in 1830, the sheep in the dep. were estimated at nearly 610,000 head, and the cattle at 145,000 do. The wool produced in the dep. is, however, of inferior quality. Rural industry of all kinds is very backward. In 1835, of 59,733 properties, subject to the *contrib. foncière*, 25,453 were assessed at less than 5 fr. and only 18 at 1,000 fr., and upwards. The fine potters' clay at St. Yriex is, perhaps, the most valuable of the mineral products: there is a tin mine at Vantry, the only place in France at which that metal is found; and copper, iron, lead, antimony, manganese, coal, &c. are met with in greater or less abundance. The manufacture of earthenware is the most important; and among its other products are iron and copper plates, cutlery, and other steel articles, nails, linen, cotton and cotton yarn, coarse woollen cloths, paper, leather hats, woollen shoes, &c. It is estimated, that 15,000 inhabs. of this dep. migrate annually as masons, sawyers, carpenters, &c. into the depts. Seine and Rhone, and the arsenals on the W. coast. Haute Vienne is divided into 4 arronds.; chief towns, Limoges, the cap., Bellac, Rochechouart, and St. Yriex. It sends 5 mems. to the Chamber of Deputies. Registered electors, in 1838-39, 1,666. Total public revenue, in 1831, 5,163,607 fr. (*Hugo*, art. *Vienne* and *Haute Vienne*; *French Official Tables*, &c.)

VIERZON-VILLE, a town of France, dep. Cher, cap. cant., on the Evre, near its junction with the Cher, in a fertile plain, 19 m. N.W. Bourges. Pop., in 1836, 4,980. It consists principally of one street, which would be among the best in France, if furnished with footways. (*Guide du Voyageur*, &c.) Its houses are mostly square; it has manufactures of woollen cloths, earthenware, and iron ware. Its castle was destroyed by Richard I. of England in 1192; and in 1356, it was pillaged by the army of the Black Prince. (*Dict. Géog.*; *Hugo*; &c.)

VIGAN (L'E), a town of France, ep. Gard, cap. arrond., on the Arre, a tributary of the Herault, 40 m. W.N.W. Nîmes. Pop., in 1836, 4,686. The *Dict. Géog.* says that it is old and ill built; but according to the *Guide du Voyageur*, it is the pleasantest and most healthy of all the small towns in the Cévennes, and one to which the opulent inhabs. of Nîmes and Montpellier resort during the heats of summer. In one of its squares has been erected a fine bronze statue of the Chevalier d'Assas, a native of the town. It has manufactures of cotton and silk hosiery, cotton yarn, leather, and paper.

VIGEVANO, a town of N. Italy, dom. of Sardinia, div. Novara, prov. Lomellina, cap. mand., on the Mora, near the Ticino, and 14 m. S.S.E. Novara. Pop., in 1834, 15,221. Its site is elevated, and it enjoys a salubrious climate. It is enclosed by walls, has an old castle, a cathedral, which stands in a square surrounded on 3 sides by arcades, one of the best cavalry barracks in

pawn-bank, a communal college, and a *sanatorium*, established in 1832. Near it is a large and handsome Dominican convent. The town has manufactures of silk stuffs, hats, soap, macaroni, &c.; two annual fairs of 8 days each, and markets twice a week. This town gave birth to Francis Sforza II., duke of Milan, and is much indebted to the munificence of the Sforza family. Under the French it was the cap. of an arrond., in the dep. of Agogna. (*Rampoldi, &c.*)

**VILLA-REAL**, a town of Spain, in Valencia, prov. Castellon de la Plana, on the Mijares, here crossed by a fine bridge of 13 arches, within about 4 m. of the sea, and 33 m. N.N.E. Valencia. Pop., according to Mifano, about 8,000. It originated in a country palace of James I., king of Aragon. It has one regular and well-built street; several religious edifices, a prison, a large suburb, and some silk and woollen manufactures, distilleries, &c. It was formerly fortified, and in the War of the Succession was garrisoned for the archduke Charles; but, having been taken by the troops of Philip V., in 1706, its defensive works and most of its buildings were destroyed, and great part of its inhabs. put to the sword.

The town of the same name in Portugal, prov. Tras-os-Montes, cap. Comarca, is said by Mifano to have 4,100 inhabs. (*Dioc. d'Esp., &c.; Mod. Trav.*)

**VILLA-RICA**, a town of Brazil, cap. of the prov. Minas-Geraes, on the Ouro-preto, by which it is intersected, and which is here crossed by four stone bridges, 190 m. N.N.W. Rio Janeiro; lat. 20° 25' 30" S., long. 43° 19' 33" W. Pop., uncertain, fluctuating with the state of the mines; in the early part of the present century it was estimated at 20,000, principally whites, but is now, probably, a good deal less. It occupies an elevated site, but it has no very striking approach; nor, on a nearer view, does it present to the eye of a traveller any object corresponding with the grandeur of its name. It is situated on the declivity of a high mountain, forming part of an immense chain. Most of the streets range in parallel rows along the side of the mountain, being crossed by others leading up the activity. These have numerous public fountains, and the town generally is admirably supplied with water, which is conveniently conducted into almost every house. (*Mawe's Brazil*, p. 238, &c.) The streets are ill-paved; but there are many good houses two stories in height, built of stone, tiled, and whitewashed.

The governor's residence, the town-hall, 2 par. churches, numerous chapels, the mint, college, and theatre, were, a few years ago, the principal edifices. Some of these are superior to the public buildings in most other parts of Brazil. The governor's palace commands a view of nearly the whole town; and in its front is an open space surrounded by a sort of parapet, on which a few brass swivels are mounted. Several of the churches, &c. are richly ornamented. The mint is in the lower part of the town, attached to the treasury and custom-house. The climate of Villa Rica, owing to its elevated situation, is very agreeable; the usual range of the thermometer is from 64° to 80° Fah. in summer, and from 48° to 70° in winter. Thunder-storms, though common, are not violent. The gardens here, which extend in raised terraces along the side of the mountain, produce excellent kitchen vegetables; but beyond these, the vicinity of the town, notwithstanding its fertility, is wholly uncultivated, and the cattle and other stock are allowed to pasture at random. The markets are accordingly ill supplied; and when Mawe visited the country, most sorts of provisions and vegetables brought a very high price. The inhabs., in fact, are chiefly interested in mining speculations; Villa Rica being, or, at all events, having been, the headquarters of the gold-mining district of Brazil. The metal, found in the mountain on which the town is built, is imbedded in a matrix of slaty clay schist resting on granite, gneiss, or sandstone. Bars of this valuable product, with precious stones, cotton, hides, marmalade, cheese, &c. are sent to Rio, where they are exchanged for slaves, manufactured goods, wines, hams, &c. Owing, however, to the falling off in the productiveness of the mines, the trade is now much less considerable than formerly. The goldsmith trade is prohibited in Villa Rica; but almost all other handicrafts are carried on. There are also manufactures of gunpowder, hats, pottery, &c. The inhabs. generally depend on mining; and in consequence of the uncertain, hazardous nature of their employment, which has greatly declined, they are very generally idle, poor, and dissolute. (*Mod. Trav. xxix.; Mawe's Brazil; Dict. Geog., &c.*)

**VILLEFRANCHE**, a town of France, dép. Aveyron, cap. arrond., on the Aveyron, 26 m. W. Rhodéz. Pop. in 1836, ex. com., 8,147. It is well built: four parallel thoroughfares divide the town into nine parts, besides which it has several suburbs interspersed with plantations. The old collegiate church, and the hospital, formerly a conventual building, are remarkable specimens of Gothic architecture. The public establishments comprise a college, a public library, museum, and club, or subscription rooms. The principal manufactures consist of linens and copper wares; it has, also, a considerable trade in

corn, cattle, and other rural produce, and 12 annual fairs.

Another town of the same name is the cap. of an arrond. in the dep. of the Rhone, on the Saone, 17 m. N.N.W. Lyons. Pop. in 1836, 7,533. It consists chiefly of one very long and wide street, is well built, and has agreeable environs. Its manufactures consist principally of linen fabrics, cotton, thread, and leather, in which articles, with the addition of wine, cattle, hemp, flax, hempen cloths, &c. it has a brisk trade with other towns in the S. of France. Near it are some lead-mines, which were wrought under the Romans. (*Hugo, &c.*)

**VILLENA** (an. *Turbula*, or *Arbucida*), a town of Spain, prov. Murcia, cap. distr., in a fine plain, 32 m. N.W. Alcantar. Pop. about 10,000. Inglis says, "It has its rock, castle, and inuerta, and is a place of some size, with several convents and churches. The vine is extensively grown upon the lower acclivities of the neighbouring sierra, and is almost all converted into brandy. The pop. of this town appeared to me to present a singularly disreputable appearance; beggarly, idle, ragged, and ruffian-like." (*Spain in 1830*, ii. 223.) Villena gives title to a marquis, whose palace, a town-hall, 2 churches, many chapels and convents, an hospital, and some barracks are its principal edifices. It has some soap factories; and in the neighbouring marshes a good deal of salt is made. (*Mifano, &c.*)

**VINCENNES**, a town of France, dép. Seine, cap. cant. on the road to Coulommiers, within a short distance of Paris. Pop., in 1836, 2,825. Vincennes owes its origin to Philip Augustus, who surrounded the wood of its name with walls, and built at one of its extremities a royal residence, on the site of which, in 1339, the present castle was erected. This castle continued to be a place of resort for the French kings till the time of Louis XI., when it was made a state prison, a destination which it retained, with little intermission, till 1784; the great Condé, Diderot, and Mirabeau, having been among the number of those confined within its walls. Under Napoleon it again served the same purpose, and here, on the 21st of March, 1804, the Duke d'Enghien was shot. The castle of Vincennes is of an oblong form, about 360 yards in length by 210 in breadth, surrounded by dry ditches, and entered by two drawbridges. The keep is a square tower, five stories in height, with four turrets, and a balcony outside the fourth story. The chapel, founded by Charles V., in 1379, but mostly rebuilt under his successors, is a rich Gothic edifice, with some fine stained glass. The *cour royale* is surrounded by modern buildings, in which are some well furnished apartments, and a large collection of arms. In the fosse, a plain column of red granite, on a foot of black marble, and bearing the inscription, "*Hic cecidit*," points out the spot where the Duke d'Enghien met his fate. The wood of Vincennes, comprising about 1,500 acres, is, with the town, a good deal resorted to by the Parisians on holidays, particularly the *fête p. nationale*, on the 15th of August. (*Guide du Voyageur en France; Hugo, &c.*)

**VINCENT (S.T.)**, one of the W. India islands, belonging to Great Britain, in the centre of the Windward group, about lat. 13° 10' N., and long. 69° 37' W., 21 m. S.S.W. St. Lucia, and 168 m. W. Barbadoes. It is of an elliptical shape, 17 m. in length, and from 7 to 14 m. in mean breadth. Area, about 22,597 were blacks. The centre of the island is occupied by a lofty range of mountains, which in some parts attain the height of 4,000 ft.; but the mountains decline rapidly towards the sea; and there are some considerable and well-watered valleys, the soil of which, consisting of a fine black mould of sand and clay, is especially adapted for the culture of sugar. In the upper grounds the soil is light and sandy. St. Vincent is of volcanic origin, and a tremendous eruption of one of its mountains, in 1812, occasioned great mischief. The mountains are clothed from their base to their summits with immense forest trees; but the ground having every where the advantage of a gradual slope, and there being little jungle or brush-wood, ventilation is not impeded. The valleys also are sufficiently wide, and free from excessive vegetation, to give a healthy character even to the uncultivated portion of the island; and there is little swampy ground, except in a few places near the sea. Only about one-third part of its surface is under cultivation. The atmosphere is generally humid, and the dews heavy; but notwithstanding, St. Vincent is justly considered one of the most healthy of the W. India islands. (*Tulloch's Rep.*) We subjoin

AN ACCOUNT OF THE PRINCIPAL ARTICLES OF PRODUCE IMPORTED INTO THE U. KINGDOM FROM ST. VINCENT DURING EACH OF THE THREE YEARS ENDING WITH 1841.

Articles.	1839.	1840.	1841.
Sugar, c. wts.	151,899	101,020	110,905
Molasses, c. wts.	54,051	16,529	31,587
Rum, galls.	189,097	145,909	88,999
Coffee, lbs.	35	699	
Cocoa, lbs.	760	6,122	1,758

The government is vested in a governor, a council of 12, and an assembly of 19 mems. Representatives of the House of Assembly must have an income of 300*l.* a year, or, if representing the town of Kingston, a house in that town of the yearly value of 100*l.* Electors must possess a freehold of 10 acres, worth 20*l.* a year in Kingston, or 10*l.* a year elsewhere. St. Vincent, with its dependency, the Grenadines, is divided into 6 pars. Kingston, the cap. lies at the bottom of a bay, near the S.W. extremity of the island, with an amphitheatre of wooded hills in its rear. The troops, amounting to nearly 900 men, are principally quartered at Fort Charlotte, on a very steep hill, about 13 m. N.W. the town, and 600 ft. above the level of the sea.

St. Vincent was discovered by Columbus, but was inhabited only by Caribs till the latter part of the 17th century, when a slave ship from Guinea having run ashore on the island the blacks mostly escaped, and settling here became in the sequel the most formidable enemies of the Caribs. It subsequently fell into the hands of the French, who ceded it to the English in 1763. In 1779, it was re-captured by the French, but it reverted, in 1783, to Great Britain. The sum awarded, in 1835, for the manumission of the slaves in St. Vincent amounted to 352,567*l.* (*Richards's West India; Talloch's Rep. on the Health of the Troops in the W. Indies; Parl. Papers*, &c.)

VINCENT (CAPE S. E.), the *Sacrum Promontorium* of the ancients, a promontory forming the S.W. extremity of Portugal, prov. Algarve, 110 m. S. Lisbon, lat. 37° 2' 54" N., long. 8° 59' 36" W. This cape is celebrated in naval history for the great victory gained in its vicinity on the 11th of February, 1757, by the British fleet, under Sir John Jervis, over a Spanish fleet. The British fleet comprised only 15, whereas that of the Spaniards amounted to 27 sail of the line. But notwithstanding this disparity, the latter were completely defeated, with the loss of two ships of 112, one of 81, and one of 74 guns. The victorious admiral, in acknowledgment of his gallantry and success, was elevated to the peerage by the title of Earl St. Vincent.

VIRE, a town of France, dep. Calvados, cap. arrond. near the source of the river of its own name, 35 m. S.W. Caen. Pop. in 1836, ex. comm., 7,290. It is well-built, principally on the declivity of a hill, on the summit of which is the Foundling Asylum, and at the base the general hospital; on the ascent, among other buildings, are the court-house, sub-prefecture, town-hall, and new prison, with a handsome square. In the middle ages, Vire had a castle, of which some remains still exist; but the greater part of its site is occupied by the town-hall and a planted promenade. The principal church is a fine Gothic building. A great deal of activity prevails in Vire, which has manufactures of coarse and fine woollens, woollen yarn, paper of all kinds, ribbons, and other steel articles, iron articles, &c., with tanneries and fulling mills. It has tribunals of primary jurisdiction, and commerce, a chamber of manufactures, council of prud'-hommes, communal college, and public library. Duhamel, and some other eminent personages, were natives of Vire. (*Hug. et al. Calvados; Dict. Encyc.*)

VIRGINIA, one of the states comprised in the republic of U. States, being the most extensive in the Union, on the Atlantic, between lat. 36½° and 41° N., and long. 77° and 84° W., having N. and N. E. Pennsylvania and Maryland, from which last it is separated by the Potomac; N. W. Ohio, the river of the same name forming the boundary, W. Kentucky, S. Tennessee and N. Carolina, and E. Chesapeake bay and the Atlantic. Length, E. to W., about 350 m.; average breadth, nearly 200 m. Area estimated at about 66,000 sq. m. Pop. in 1840, 1,230,757, of whom 448,287 were slaves. The Alleghany, Blue, and other mountains traverse this state from N. to S. in several parallel ranges, forming its centre into a table land, which in some parts rises to nearly 6,000 feet in height. The western portion of the state is also very mountainous. "The extreme western part is, indeed, composed of a congeries of hills with alluvial bottoms; but the actual mountain ridges encroach so near Ohio river, and the hills are in themselves so generally abrupt and lofty as to give an alpine appearance to the country." (*Darby's U. States*, 616.)

The rivers may be divided into those that flow into the Atlantic, and those that join the Ohio. The Potomac rises in lat. 39° 12' N.; it flows at first N. E. to about lat. 39° 59' N., and thence in a S. E. direction into Chesapeake bay, which it enters 70 m. in a direct line, below Washington, after a course of about 360 m. It receives its principal affluent, the Shenandoah, from the S.W., at the celebrated mountain-pass of Harper's Ferry, where it breaks through the Blue Mountains, amid some of the grandest scenery of the States. The Potomac is navigable for ships of any burthen to Alexandria, upwards of 100 m. from its mouth, being the most distant point from the ocean to which ships of war can be navigated in the interior of the Union. James river, on which the rap. of Virginia is built, rises in and flows through the

centre of this state to Chesapeake bay, being navigable for vessels of 140 tons to Richmond, 100 m. from its mouth. Over one of its affluent, about 25 m. N. W. Lynchburg, is a stupendous natural bridge, 90 feet in length, across a chasm above 200 feet in depth. Mr. Jefferson says, that it is impossible for the emotions arising from the sublime to be felt more intensely than in this spectacle, looking from the bottom of the chasm. "So beautiful an arch, so elevated, so light, and springing as it were, up to heaven it must be seen to be described." (*Notes*, 36.) The Roanoke lies partly within the state; the Rappahannock, York, and Mattawake, are the other principal streams on the Atlantic side. The chief affluent of the Ohio is the Great Kenhawa, which rises in N. Carolina, joins the Ohio at Point Pleasant in Virginia, and is navigable to Charleston, 60 m. from its mouth. Darby says, that "Virginia, next to Georgia and Illinois, has the greatest range of lat. of any of the U. States, and it may be doubted if it do not exceed even Georgia in extremes of temperature. The counties on the Chesapeake are much warmer than those in the interior, as is strongly manifested in their vegetation."

As regards surface and soil, Virginia may be divided into 4 sections. The E., or seaboard section, extending about 100 m. inland, or to the heads of the tide waters, is generally low and level, but sandy and unproductive, parts of it being more swamps, and extending almost as desolate an appearance as the pine barrens of New Jersey. The second section, which includes the country between the latter and the Blue Mountains, is, perhaps, the most productive; the alluvial lands along the rivers in this part of the state are, for the most part, very fine; those of James' river especially being remarkable for their fertility. The third section includes the valley between the Blue ridge and the Alleghany Mountains, and though in parts broken by mountains, has a great deal of fine fertile land. The fourth section includes the country between the Alleghany chain and the Ohio; this portion is in general wild and broken, and is in great part covered by primeval forests. But it also contains large tracts of fine land, with vast deposits of coal, ironstone, salt, &c.

The wheat of Virginia is inferior, but maize, cotton, tobacco, and numerous fruits attain to perfection. In 1840, the official returns state, that upwards of 31 million bushels maize were reaped in this state, being more than was produced in any other state of the Union, except Tennessee; during the same year, there were also reaped 10,046,061 bushels wheat, and 11,121,000 bushels oats. Tobacco is, however, the principal crop in the E. part of the state, where, in 1840, the produce is stated to have been 71,157,344 lbs., or more than half the entire quantity produced in the Union.

Jefferson, in his *Notes on Virginia*, one of the ablest works of his class that has ever been published, speaks in very disparaging terms of the culture of tobacco. He says, "that it is suitable only for the very finest lands, which it rapidly impoverishes;" that it "is productive of indolent wretchedness;" and that the individuals engaged in it "are in a continued state of exertion, beyond the powers of nature to support." (*Notes*, &c., p. 27, ed. Lond. 1787.) Probably this statement may be a little overcharged, but there can be no doubt of its being substantially accurate; and, in fact, the culture of tobacco in this state has, for a lengthened period, been either stationary or retrograde.

The culture of cotton is carried on to some, though to no great extent; the quantity produced in 1840 being stated at 10,767,000 lbs.; some wine is made; and small quantities of sugar are obtained, partly from the cane, and partly from the maple. (*Return and Progress of 1840*.) Agriculture in most parts of the state is in a very depressed and backward state; and the crops are very inferior, compared to what they might be under a different system. Land that has been cleared is usually cropped without intermission or manure till it is exhausted, when it is left to recover itself. Elsewhere the three shift system frequently prevails, by which a crop of maize in one year is succeeded by one of wheat, rye, or oats in the next; and this not by a fallow, but by a year of rest, during which weeds and other herbage, the spontaneous produce of the soil, afford a scanty subsistence to a few half-fed cattle. In parts of the country, however, and especially on the Potomac, some improvements have been made in agriculture; and W. of the mountains along the Ohio are some well irrigated meadows. In 1840, the stock of cattle was estimated at about a million head, and of sheep at 1,200,000; the produce of wool was about 3,666,000 lbs., a quantity inferior only to that produced in New York. The mineral riches of Virginia are of first-rate importance. Coal is very widely diffused; the bituminous on the W. side, and the semi-bituminous and anthracite on the E. side of the mountains. The beds of coal are in many places from 30 to 60 ft. thick, and alternate sometimes with dense beds of iron ore. The coal in the Richmond basin is rather extensively wrought, and the works

at New Carron furnish considerable quantities of iron. Gypsum, magnesia, alum, and petroleum, are among the mineral products; and from 1829 to 1840 gold to the value of 578,595 dollars was sent to the mint of the U. States. The region, including Spotsylvania and some other counties, where the gold is found, abounds in quartz, containing cubes of sulphuret of iron, often partly or totally decomposed, the cells of which are sometimes filled with gold. The latter is found also on the surface, especially of slate, and in its fissures. The metal is obtained by filtration, or washing the earth, and by an amalgam of quicksilver. On the whole, however, the search after gold here, as in most other parts of the U. States, has not been very productive, and it is doubtful whether it will ever be of any importance. There are numerous salt, and other mineral, springs; those on the Kenhawah furnishing annually about 3,000,000 bushels salt.

The manufactures of Virginia are unimportant; but Richmond and Lynchburg are commercial towns of some eminence. The value of the imports from foreign states during the year ending the 30th Sept., 1840, amounted to 515,685 dollars, and that of the exports during the same year to 4,778,220 do. The board of public works in this state had, in 1835, a fund of 3,223,900 dollars, and has effected some valuable internal improvements. The Potomac is connected with the Roonoke by railways through Fredericksburg, Richmond, and Petersburg, forming a line 157 m. in length; a line 13 m. in length extends from Richmond to the Chestfield coal mines; and another line is intended, and is probably in progress, to connect Lynchburg with the Tennessee line across the Alleghany mountains. Several canals are completed; the principal being the James' river and Kenhawah canal, 175 m. in length.

The present form of government, adopted in 1830, vests the legislative authority in a General Assembly, consisting of a Senate of 32 mems., chosen every 4 years, and a House of Delegates of 134 mems. elected annually. The Governor and Council of State are chosen every 3 years. The right of suffrage is exercised by every white male citizen of full age possessing freehold property to the value of 25 shillings, or having a freehold title to land of the value of 20 dollars, and who has been a householder for 12 months previously to the election. The General Assembly meets annually at Richmond in December. The State sends 21 representatives to Congress. Virginia is divided into 119 cos., and 10 judicial districts: Richmond on James' river is the cap. and seat of gov.; Williamsburg, Fredericksburg, Charlottesville, Lynchburg, and Lexington, are the other principal towns. Courts of appeal sit once a year at Lewisburg for W., and at Richmond for E., Virginia, and a circuit Superior Court of Law and Chancery is held twice a year in each co. and corporation. The state militia, in 1840, comprised 105,522 men. The public revenue in 1840 amounted to 665,557 dollars, and the expenditure to 580,487 dollars; the total public debt in the same year was 6,887,161 dollars.

Virginia has several colleges and other seminaries. The university at Charlottesville, established in 1819, has a library with 16,000 vols., and in 1840-1841 was attended by 290 students. The college of William and Mary, established by the Baptists in 1691, is, excepting Harvard college, the oldest institution of the kind in the Union, and had, in 1840-1841, 110 students. The Washington college at Lexington, founded in 1812, was at the same period attended by 94 students. There are many other superior schools and academies, and, in 1840, there were in the state 1561 common schools attended by 35,321 children. An historical and philosophical society was formed in 1832. Baptists and Methodists are the prevailing religious sects, next to whom Presbyterians are the most numerous; there are but few R. Catholics, Friends, Unitarians, and Jews. Nearly the whole of the Baptist association consists either of coloured persons or slaves. The importance of Virginia has, in consequence of the rapid growth of other states, declined rapidly since the Revolution. The principal towns are Richmond, the capital, with, in 1840, a pop. of 20,143; Petersburg, 11,136; and Norfolk, 10,920. (*Jefferson's Notes on Virginia*; *Darby, View of the U. S.*; *American Almanac* for 1841-1842; *Encyclopædia Americana*, &c.)

Virginia was the seat of the earliest colony planted by the English in the States' territory, a part of it having been settled in 1607. Its name, given in honour of Queen Elizabeth, was originally applied to the whole E. coast of N. America. The first legislature of Virginia met in 1619. Notwithstanding serious disputes with the Stuarts, Virginia supported the royal cause in the civil wars; and Charles II. was proclaimed here before the news of his restoration had arrived from England. Among the distinguished natives of Virginia is the immortal Washington, the father of American independence, born in Westmoreland co., on the 11th of February, 1732. It is also the native country of Jefferson, the author of the "Declaration of Independence," and of the "Notes on Virginia," and president of the Union.

**VISTULA** (Germ. *Weichsel*), one of the great rivers of central Europe, flowing from S. to N. through Poland. The basin of the Vistula is situated between those of the Elbe to the W., the Niemen and Dniestr to the N.E. and N., and the Dniestr to the S.E. It rises in Moravia, in a branch of the Carpathians, close on the frontier of Galicia, and about 20 m. S.E. Teschen; and at a short distance from its source is precipitated over a fall 180 ft. in height. It proceeds at first N. for about 40 m., and then turns to the E., separating Silesia, the territory of Cracow, and the kingdom of Poland on the N., from Galicia on the S. Shortly after passing Sandomir it again flows northward, which course it retains through the centre of Poland to beyond Warsaw. It now turns W.N.W., and pursues generally the same direction to the influx of the Braa, 20 m. from Thorn; after which its course varies little from N.N.E. to its mouth in the Baltic. Its entire length is estimated at 550 m. It receives a vast number of tributaries, the principal of which are the Nida, Kamienna, Pilica, and Braa, from the W.; and the San, Wieprz, and Bug, with its tributaries, from the E. At Cracow it is only about 150 ft. in width; at Warsaw it is crossed by a bridge of boats 1,600 ft. in length. After receiving the Bug, a stream nearly equal in size to itself, at Modlin, it proceeds generally in a very wide channel past Plock, Thorn, Culm, and Marienwerder, about 15 m. below which last, and about 30 m. from the Baltic, it divides into two great arms, the most easterly of which, called the Nogat, flows past Marienburg and Elbing into the Frische Hafl. The W. arm, or main stream, subdivides again at about 16 m. from the sea, the E. branch falling into the Frische Hafl, and the W. making a long detour round by Dantzic. It is said, however, that during some heavy floods in the autumn of 1840 the eastern arm of the river opened for itself a direct course to the Baltic; a result which it is said the Prussian gov. had contemplated effecting by artificial means. This river is of very considerable commercial importance, being, as it were, the great highway of the extensive countries through which it flows; the channel by which their wheat, timber, and other products are conveyed to Dantzic and Elbing for exportation, and by which they receive supplies of colonial and other foreign produce. As it flows for the most part through a level country, it is navigable throughout the greater part of its extent. Large flat-bottomed boats convey the produce of the countries through which it passes to the port of Dantzic, and Warsaw is thus placed in direct communication with the Baltic; while, by means of the navigation of the Nogat, the colonial produce imported into Königsberg finds a ready access to Poland, Moravia, and Hungary. (*Granville's Travels*, i. 315.) The Vistula is connected with the Elbe by a canal from the Braa to the Netz, between Bromberg and Nakel; and with the Niemen by means of the canal of Augustow. (*Dict. Géog.*, &c.)

**VITERBO** a city of central Italy, Papal States, cap. dioc. of same name, in the Campagna, and on the road between Rome and S. m. 27. Pop. stated by Rumpold to be little short of 15,000. It is well built, with volcanic tuff, and well paved, having a large and handsome square, 16 par. churches, and numerous noble residences, and public fountains. Woods says it is a curious-looking city, with an abundance of caverns in the porphyritic faces of the rocks, bordering a little valley passing through it. The cathedral has a range of columns on each side, with grotesque capitals supporting semicircular arches. The Trinità is a handsome modern church, in the form of a Latin cross, with a dome in the centre. The church of St. Francis is a large building; the transept has pointed vaulting, and there are 2 fine archways of the pointed style, leading into chapels, and some Gothic tombs. It boasts also a painting by Sebastian del Piombo, from designs by Michael Angelo. (*Letters of an Architect*, i. 323.) The pontifical palace is a fine building. Viterbo is the seat of a cardinal legate, and a court of primary jurisdiction. It has no manufactures worthy of notice; though alum, vitriol, sulphur, and other volcanic products are obtained in its neighbourhood, which abounds with mineral springs.

Viterbo is supposed to occupy the site of the *Favum Volturum*, the place where the general assembly of the Etruscan nations was held on solemn occasions. The modern town was encircled with tormented walls by Desiderius, the last king of the Lombards. It has been the residence of numerous popes, several of whom are buried in its churches. In its vicinity are many villas belonging to some of the more opulent Roman families. (*Rumpold*; *Woods*; *Cramer's Anc. Italy*.)

**VITRÉ**, a town of France, dép. Vilaine, cap. arrond., on the Vilaine, 23 m. W. Rennes. Pop., in 1836, ex. comm. 7,869. It is inclosed by walls of Gothic character and flanked by round towers. Vitre is ill built, dirty

\* The river can not be confounded with the S. Bug (an. *Hypania*) which runs to the N. (p. 181.)

artist, and destitute of any public promenade; though the environs are agreeable, and in the vicinity are two parks open to the public. About 14 m. S. from the town is the Chateau des Rochers, the seat of Madame de Sévigné, the most accomplished of letter writers, who sometimes also occupied a house in the town. Near the town are also the ruins of the castle, formerly belonging to the Dukes de la Trimoille. The peasantry of the neighbourhood wear winter cloaks of goat-skins, which, with cotton hosiery, salt cloth, flannels, leather, and barrels are among the principal articles manufactured in Vitry. Wax, honey, and cantharides are here considerable articles, and the town has no fewer than 22 annual fairs. Savary, the traveller, was a native of Vitry, where he first saw the light in 1750. (*Hugo, art. Ille-et-Vilaine.*)

**VITRY-LE-FRANCOIS**, a town of France, dcp. Marne, cap. arrond., on the Marne, 20 m. S.S.E. Châlons. Pop., in 1836, ex-comm. 6,616. Is square shaped, and is inclosed by earth ramparts, and bastions, outside which is a deep moat. It is tolerably well laid out; and though most of its houses are old and unprepossessing, it has a good many new buildings erected since the peace. Its church, an edifice in the Corinthian and Composite styles, was the earliest of any consequence built after the restoration of the arts, in the time of Francis I., under whom this town was founded. Vitry has a good public hall and theatre, and agreeable public walks, with some manufactures of cotton yarn and hosiery, hats, leather, &c. (*Hugo, Dict. Géog.*; &c.)

**VITTORIA** (Span. *Vitoria*), a town of Spain in Biscay, cap. prov., on the high road between Burgos and Bayonne, 60 m. N.W. the former. Pop. estimated by Miñano at 12,000. It consists of an old and a new town, very different in appearance; the latter being clean and handsome, while the former is quite the contrary. The *Plaza Nueva*, a square, which, according to Ingalls, is little inferior to the *Place Vendôme* in Paris, has arcades at its sides, under which are very good shops: the S. side is occupied by the town hall, and the area serves for a market place. The hall of the Biscayan Society, orphan asylum, and general hospital are among the principal edifices. Vitoria has a collegiate and four par. churches, six conventual establishments, a school of design, public library, cabinet of coins and Roman antiquities, post-house, &c. Its manufactures comprise chairs and cabinet furniture, copper utensils, earthenware, cutlery, linens, &c., and being one of the principal entrepôts for the trade between Navarre and Old Castile, and the ports of St. Sebastian and Bilbao, it has a considerable traffic in iron, wool, woollen and silk fabrics, articles of clothing, and colonial produce. In modern times, Vitoria is famous for the decisive victory gained in its vicinity, on the 21st of June, 1813, by the Anglo-Spanish army, under the Duke of Wellington, over a French army commanded by King Joseph and Marshal Jourdan. Though the loss of men in the battle was nearly equal, the French were totally defeated, with the loss of all their artillery, baggage, ammunition, and treasure, and obliged to make a rapid retreat across the Pyrenees; this battle having all but annihilated their power in Spain. (*Napier's Peninsular War*, v. 555—560.)

**VIZAGAPATAM**, a sea-port town of British India, presid. Madras, coast of Coromandel, cap. of a district of same name, in the N. Circars, at the mouth of a small river, lat. 17° 42' 30" N., long. 83° 24' E. It is not a place of any strength, its only defensive works being a thick wall inclosing the Zillah court house, hospital, other European buildings, and a bazar in the centre of the town. The barracks and other public edifices are outside this wall. A good many well-built houses stretch along the shore; but the great inadaptability of the town has driven most of the former European residents to Waltier, a village at some little distance. (*Hamilton's E. I. Gazetteer.*)

**VLADIMIR**, a government of European Russia, between the 55th and 57th degs. of N. lat., and the 35th and 42d of E. long., having N. Jaroslavl and Kostroma, E. Nijni Novgorod, W. Tver, and S. Moscow, Iliadon, and Tambou. Area estimated at 17,600 sq. m. Pop. in 1834, 1,133,300. Surface almost a level plain, watered by numerous rivers, the principal being the Oka in the E., the Volga in the W., and the Klazma, a tributary of the Oka, in the centre; all of which have, more or less, a N.E. course. The soil is not generally fertile, and a large part of the government is covered with forests, marshes, pools, and heaths. Rye, barley, oats, summer and winter wheat, millet, peas, hemp, and flax are grown; but the crops of corn are insufficient for the consumption. The gardens and orchards are pretty numerous and well attended to; and Vladimir is famous for its cherries and apples. A good many cucumbers and some hops are raised. Cattle rearing is a secondary business, and is far behind. The forests are of vast extent, those belonging to the crown alone covering about one ninth part of the entire surface. Extensive and valu-

able beds of iron ore have been found in the forest of Mouroum; and at Vixa, on the Oka, are some of the most extensive iron-works in Russia. (*Lyall's Russia*, ii. 321—323.) The poverty of the soil, and other concurring circumstances, have turned the attention of the inhabitants towards manufactures, which appear to have succeeded better in this than in most other Russian governments. In 1830, the manufacturing establishments in the government employed 48,176 workmen. The cotton manufacture, which is by far the most extensive, is principally carried on at Choulia and Ivanova, where it employed, in 1828, 15,612 looms, and 24,257 work-people. It would seem, however, that this and other branches of industry have rapidly increased in the interval; for the official returns show that, in 1839, 315 factories afforded employment to 83,655 work-people, being little short of double the number employed in the government in 1830! The manufacture of woollen and linen is of less importance; but about 4,000 hands are employed in iron foundries; and about 1,300 in glass and crystal works, exclusive of those employed in the production of leather, earthenware, &c. The various products of the government are sent down the Klazma and Oka, or else to Moscow, by means of land carriage. Corn, cotton-twist, and flax from the neighbouring governments of Kostroma, Jaroslavl, and Nijni Novgorod, are the chief articles of import. Vladimir is divided into 13 districts; chief towns, Vladimir, the cap., Choulia, and Mouroum. Total public revenue about 4,000,000 roubles.

**VLADIMIR**, a town of European Russia, cap. of the above government, near the Klazma, and on one of its small tributaries, 110 m. E. by N. Moscow; lat. 56° 27' 30" N., long. 40° 21' 45" E. Pop. estimated at 7,000. (*Postart.*) Vladimir occupies a site rather more elevated than the rest of its government. It is surrounded by a ditch and earth rampart, and like almost all the ancient towns of Russia is divided into 3 portions. Its principal street is long, wide, and lined with houses, of wood and stone intermixed. The cross streets are mostly mean. The principal structure is the cathedral of the Assumption, a square edifice, surmounted by 5 domes, and richly ornamented inside, though much less magnificent than formerly. There are about a dozen other churches. The former palace of the archbishop now serves for a seminary. The governor's house, court-house, garrison, a nursery, &c., are brick edifices. Vladimir is not considered a wealthy town or a principal emporium, owing partly to its distance from any large navigable river, and partly to the proximity of Moscow. Being, however, on the great road to the fairs of Nijni Novgorod and Irlit, and on the grand line of communication between Russia and Siberia, it often presents a busy and cheerful aspect. Some of its inhabitants are occupied in making linen cloths and leather; and many others in the cultivation of fruit, particularly cherries, which are grown in great quantities in the neighbourhood. The era of its foundation is uncertain; some authors place it in the 10th, and others in the 12th century. Vladimir was, however, the cap. of the Grand Duchy of Russia from 1157 till 1328, when that distinction was transferred to Moscow. (*Lyell's Trav. in Russia*; *Postart's Sketches*, &c.)

**VOGHERA**, a town of N. Italy, Sardinian dom., div. Alessandria, cap. prov., on the Staffora, 21 m. E. by N. Alessandria. Pop. in 1838, 10,706. It is well built, is surrounded by walls, has a good market place, a magnificent collegiate church, a Jesuits' college, several monasteries, large barracks, and a good hospital. It is the residence of a governor, and the seat of a provincial court of justice; it has an active trade in corn, wine, and silk. (*Rampoldi*, &c.)

**VOLCANO**. See *LIPARI ISLANDS*.

**VOLHYNIA**, a gov. of European Russia, formerly comprised in the kingd. of Poland; principally between the 50th and 52d degs. of N. lat., and the 24th and 29th of E. long., having N.W. and N. the govvs. of Grodno, Minsk, E. and S.E. Kiev, S. Podolia, S.W. Austrian Poland, and W. the palatinate of Lublin. Area estimated at 22,740 sq. m. Pop. in 1838, 1,314,100. It is in general an undulating plain; and the hills, which are the last ramifications of the Carpathians, though they no where rise to 300 ft. above the sea, give an agreeable variety to the scenery. The Bug rises in this prov.; the other principal rivers are the Styr, Goryne, &c., tributaries of the Pripietz. Along some of these are extensive marshes and beds of turf; but in general the land is very fertile, producing, at an average, a considerable surplus of corn above the consumption. A good deal of flax and hemp is also grown. Agriculture is, however, not more advanced than in the rest of Russian Poland, and the gardens and orchards, particularly the former, are much neglected. The climate, though comparatively mild, is not warm enough for the vine. The forests comprise oak, beech, linden, fir, pines, &c., and are very extensive, though only about 44,754 declivities of forest land belong to the crown. The pastures are of excellent, and well adapted for the fattening of cattle; a good many sheep,

hogs, and poultry are kept. Volhynia has a breed of horses smaller than the generality of those of Poland. Fishing is an occupation of some importance; bog-iron, mill-stones, potter's clay, nitre, and flint are among the mineral products. Though agriculture is the chief occupation of the inhabitants, the manufacturing industry of Volhynia is greater than that of most other parts of Russian Poland. The women, almost everywhere spin and weave different fabrics; and leather, glass, and earthenware, paper, potash, tar, charcoal, &c., are generally made. The principal exports are, however, corn, cattle, hides, flour, wool, wax, honey, and other rural produce. In 1835, the value of the exports was estimated at about 12,165,000 roubles, and that of the imports at 15,073,000 do. The trade is principally in the hands of the Jews, of whom there are about 40,000 in the gov. The rest of the pop. consists of Rusniaks, with Poles in the towns, and some Great Russians, gypsies, Tartars, Moldavians, and Germans. The inhabitants are mostly of the Greek, or united church. Volhynia is divided into 12 districts; principal town, Zytomir or Jitomir, the cap. A large annual fair is held at Easter at Herditchef. Public education appears to be less backward in this than in most of the Russian governments; and in 1832, besides the government printing-press, there were 6 others, and a lithographic press. Volhynia, like Podolia, is subordinate to the military governor of Kief, but is one of the Polish provinces, which preserves, in some degree, its ancient constitution and laws. (*Schneider, La Russie; Possart, Das Kaiserth; Russland, &c.*)

VOLOGDA, the largest government of European Russia, after that of Archangel, between the 58th and 64th degs. of N. lat., and the 38th and 60th of E. long., having N. Archangel, W. Olonetz and Novgorod, S. Jaroislavl, Kostroma, and Viatka, and E. the Ouralian Mountains, separating it from Tobolsk. Area estimated at upwards of 145,800 sq. m. Pop. in 1838, 747,500. Except in the E., where it is covered with the Ouralian mountain, the surface generally is an undulating plain, comprised in the basin of the N. Dwina, which is its largest river. The general slope is accordingly to the N.W. In the S. and S.W. the soil is fertile, but elsewhere it is sandy or thin, and the greater part of the surface is covered with marshes and forests of pine, birch, oak, &c. Though the climate varies with the situation, it is, speaking generally, very severe: it is far, however, from being unhealthy, and instances of longevity are frequent. The grains principally cultivated are rye and barley; but the produce of corn is insufficient for the consumption. Hemp, flax, and hops succeed, as do beans and peas. Cattle and horses are numerous and good; but a large part of the government being uncultivated and in a state of nature, the chase necessarily occupies much attention. The forests, which are its principal source of wealth, are of great extent, those of the crown only covering 29,558,000 deciatines of land. Granite, marble, salt, flints, copper, and iron are all obtained in Vologda. In 1834, there were 114 manufacturing establishments, principally for woollen and linen fabrics, soap, leather, potash, glass wares, and paper. Distillation is also very extensively carried on. Furs, tallow, pitch, wooden articles, masts and timber, turpentine, and other raw products are the great articles of export; being sent, for the most part, into the governments of Archangel and Tobolsk. The pop. is principally Russian, but include some Zyrians or Surjans of Finnish stock; and in the N. are some wandering Samoyede tribes. Public instruction, owing to the thinness of the pop., is necessarily very limited; but it has been materially increased of late years. This territory is divided into 10 districts: the chief towns are Vologda, the cap., and Ustiug-Velki.

VOLOGDA, a town of European Russia, cap. of the above government, near its S.W. extremity, 352 m. E. by S. Petersburg; lat. 59° 13' 30" N., long. 40° 21' 15" E. Pop. in 1834 estimated at 14,000. It is built on both sides the river Vologda, and is supposed to be one of the most ancient towns in Russia. Most part of its houses are still of wood, but the buildings in stone are increasing, and several of its churches are of that material. It has two cathedrals, one of which was rebuilt in 1832. The palaces of the archbishop and governor, the prison, gymnasium, hospital, various asylums, and an episcopal seminary, are conspicuous edifices. Near the town is a famous convent, founded in 1371.

Vologda has manufactures of soap, potash, cordage, bells, and tallow candles; for which last it is famous over all the N. of Russia. Its trade is considerable, which is principally with the Baltic, Germany, and England; and also with Siberia, to the boundaries of the Chinese empire. (*Possart; Schneider, &c.*)

VOLTEKKA (an *Volaterra*), a town of central Italy, in Tuscany, prov. Pisa, on a steep hill near a small tributary of the Cecina, 32 m. S.W. Florence. Pop., including its suburbs, about 6,000. It has a citadel, now used as a state prison; a hospital, a cathedral, and many other

churches; a very tolerable Inn, a large and fine town-hall, a theatre, a Piarist college, and a seminary. Its inhabs. are principally agriculturists, but a few of them are engaged in the manufacture of earthenware vases and plaster figures.

Even if we had not the express authority of Dion. Halicarnassus, (lil. 51.), for assigning to Volterra a place among the 12 principal cities of ancient Etruria, the extent of its remains, its massive walls, vast sepulchral chambers, and numerous objects of Etruscan art, would alone suffice to show its antique splendour and importance, and claim for it that rank. Its walls were formed, as may yet be seen, of huge massive stones piled on each other without cement; and their circuit, which is still distinctly marked, embraced a circumference of between 3 and 4 m. (*Cramer's Anc. Italy*, i. 185.) Two of its original gates are still in existence: one, called the Gate of Hercules, consisting of 2 arches, is in a very perfect state, and the other leads to an ancient Etruscan burial ground, in which are some remarkable tombs. Under walls of the modern town, 2 m. in circuit, are said to have been built by the emperor Otho, and are still in good preservation. There are several other Roman antiquities, including a *piacina* or public museum, containing numerous remains of antiquity discovered in the neighbourhood. Persius, the satirist, is generally supposed to have been a native of Volterra, where he is said to have been born A.D. 34. (*Kampoldi; Cramer's Anc. Italy*, &c.)

VORONEJE, or VORONETZ, a gov. of European Russia, between lat. 48° 40' and 53° N., and 38° and 43° E. long.; having N. the govs. Riazan and Tambof; E. Saratof and the territory of the Don Cossacks; S. the latter and gov. of Ekaterinoslav; and W. Kharkoff, Koursk, and Orlov. Area estimated at 28,700 sq. m. Pop., in 1838, 1,567,200. Surface undulating, and soil in general good; this being, in fact, one of the most productive govs. in the empire. Principal rivers, the Don and some of its tributaries. Climate comparatively mild; the rivers being covered with ice for only two or three months of the year, and the gov. producing most of the products of temperate climates. Of 6,876,000 deciatines (1 deciat = 27 acres) comprised in the gov., the arable lands have been estimated to include 2,711,800, pasture lands, 2,818,000 do., and forests, 620,755 do. In good years a surplus is raised of about 1,800,000 chetwerts of corn beyond the home consumption. Besides wheat, pease, oats, beans, poppies, tobacco, hemp, and flax are grown; and, in the gardens, melons, cucumbers, onions, &c., in large quantities. Water melons, indeed, are cultivated for the markets of Moscow and Petersburg, being planted in open fields covering whole acres of land. In some parts canes and reeds are used for fuel, but in general the forests furnish a sufficient supply of fire-wood. Oaks are numerous and luxuriant; pine woods are few. In 1832, the cattle in the gov. were estimated at 550,000 head; the sheep at nearly a million, and 11,600 horses were kept in 83 studs. Honey is an important product. Iron, limestone, and saltpetre are among the minerals. Manufactures of coarse woollens and other fabrics are rapidly increasing, having more than doubled between 1821 and 1835. The number of distilleries decreased during the same period; but we are not aware whether the production of spirits has undergone any corresponding decrease. The exports from the gov. consist principally of corn, cattle, skins, honey and wax, fruits, &c.

This gov. is divided into 12 districts: chief town, Voroneje, the cap. Except a colony of Germans near Ostrogojok and some gypsies, the pop. consists in the S. of Cossacks and White Russians, in the N. of Great Russians. Voroneje is under the same governor-general with Riazan, Orel, Tambof, and Saratof. The total revenue of the crown from this gov. amounts to about 15,000,000 roubles.

VORONEJE, a town of Russia, cap. of the above gov., on the river of the same name, near its confluence with the Don, and 290 m. S.S.E. Moscow. Pop. 18,000. (*Possart*). It stands on a steep height, and might easily be rendered a fortress of some strength, as it is not commanded by any other hill, and is partly surrounded by a marsh for several months of the year. It consists of three portions, the upper town, lower town, and suburbs. "It has some spacious streets, but a great many which are very mean: the suburbs are as black and gloomy as a country village." The principal street has a noble appearance, its sides being lined with massy and handsome edifices, many of them the property of the crown, as the governor's and vice-governor's houses, the tribunals, post-office, commissariat academy, &c. The Moscow (Moskovskaya) street is also very fine, and in it are the archbishop's palace, with an adjoining cathedral. The archbishop, or *bazars*, are very respectable. (*Lyall's Trav.* li. 308.) Voroneje has 18 stone churches, 2 convents, an exchange or *gostinoi-dvor*, for the warehousing, exhibition, and sale of merchandise, an episcopal sem-

nary, schools for the children of the clergy, military, civil employes, and citizens, a hospital for 310 sick persons, military orphan asylum, &c. It is one of the most flourishing towns in the S. of Russia; and its merchants carry on a lucrative trade with the Black Sea, Crimea, and Turkey, and travel annually to Tobolsk, to buy furs, which they afterwards take to the great German fairs. The town has also some soap, tallow, leather and woollen cloth factories. It is supposed to be among the oldest Russian towns, and is spoken of as existing in the 12th century. Here Peter the Great built a palace, and established a dock-yard, arsenal, &c.; but the latter establishments were afterwards removed successively to Ustev, Tavrof, and Rostof; and nearly all traces of the palace and magazines have been obliterated by the frequent fires which the town has since suffered. (*Schnitzler, La Russie; Possart; Lyall's Trav. in Russia, &c.*)

VOSGES, a dep. of France, reg. N. E., principally between the 48° and 49° of N. lat., and the 5° and 7½° of E. long., having N. the depts. Meurthe and Moselle, E. the dep. of the Rhine, S. Haute-Saône, and W. Haute-Marne. Area, 585,963 hectares. Pop., in 1836, 397,997. This dep. derives its name from the Vosges (Germ. *Wagau*) mountains, a chain which extends parallel with the Rhine, separating the depts. of Haute and Bas-Rhin on the E. from those of Haute-Saône, Vosges, and Meurthe on the W., stretching also into Rhenish Bavaria, and terminating to the N.E. in Mont Tonnerre. These mountains usually rise between 4,000 and 5,000 feet above the sea, and their summits are covered with snow for most part of the year. They send off a remarkable continuation, the Faucilles mountains, E. and W. through this dep., by the ramifications of which nearly its whole surface is covered. The Moselle, Meuse, Meurthe, Madon, Saône, &c., rise in this dep., all of which, except the Saône, have a N. course. Small lakes are numerous. The arable land, which is said to comprise 244,745 hectares, is not generally fertile; the meadows comprise 70,390 hectares; woods, 129,174 hectares; and heaths, wastes, &c., 36,550 hectares. In a portion of the dep. called "the plain," to the W. of Epinal, agriculture is said by Hugo to be pretty well advanced. The land is divided into very small properties; so much so, that in 1835, of 148,609 properties subject to the *contrib. foncière*, 67,600 were assessed at less than 5 francs, and only 43 at 1,000 francs or upwards. In 1835, the produce of corn, principally oats, wheat, and rye, was estimated at less than 2,000,000 hectolitres, and the potatoe crop was about as much. The rearing of stock is the most important branch of husbandry, and a greater number of cattle are kept in this than in any other of the N.E. depts.; in 1830, they were reckoned at about 140,000 head. Sheep are much less numerous, and the annual produce of wool is said by Hugo not to exceed 45,600 kilogram. The annual produce of cheese may be about 20,000 kilogr.; and that of wine (of very indifferent quality) about 150,000 hectolitres; about 128,000 kilogr. of hops are annually sent to Paris. Cherries are grown in large quantities, and the dep. is famous for its *kirschschnaps*. A good many hogs are fattened in the mountains. The forests abound in good iron timber, great quantities of which are floated down the rivers, as deals and rough timber. Iron is the chief mineral product; but it also produces coal, argilliferous lead, copper, manganese, granite, marble, porphyry, &c., though many of these resources are much neglected. The manufacture of steel and iron goods hold the first rank. Knives and forks are made at Brénayères; bayonets, &c., at Sionne, and nails at Neuchâteau; plate iron is made in large quantities at various places; and Plombières is famous for its cutlery. Cotton stuffs are made in the arrouds of Remiremont and St. Dié. Lace, musical instruments, barrels, and wooden shoes are considerable articles of manufacture; and there are various glass and marble works, tanneries, breweries, &c. Vosges is divided into 5 arrons.; 1, chief towns, Epinal, the cap.; Mirecourt, Neuchâteau, Remiremont, and St. Dié. It sends 5 mems. to the Ch. of Dep. Number of electors, in 1838-39, 999. Total public revenue, 1831, 7,165,877 francs. (*Hugo, Art. Vosges; French Official Tables, &c.*)

## W.

WAAL, a river of the Netherlands, *see* RHINE.

WAGRAM, a village of the archduchy of Austria, country below the Enns, on the left bank of the Rossbach, 11 m. N.E. Vienna. This village is celebrated in military history for the great battle fought in its vicinity, on the 6th of July, 1809, by the grand French army under Napoleon, and the Austrians under the Archduke Charles. The former gained a complete victory; the Austrians lost above 20,000 men taken prisoners, besides a vast number killed and wounded. This great victory led to an armistice followed by the treaty of Schœnbrunn.

WAKEFIELD, a parl. bor., market-town, and par. of England, W. Riding, co. York, lower div. of Aghrigg,

weapont. Aghrigg and Morley, on the Calder, 30 m. S.W. York, and 9 m. S. Leeds. Area of par., comprising the townships of Wakefield, Stanley-cum-Wrenthorpe, Alverthorpe-with-Thornes, and the chapelry of Horbury, 9,390 acres. Pop., in 1831, 24,538; in 1841, 28,321. The parl. bor., however, includes only the township of Wakefield (pop. in 1841, 13,777), with small portions of Alverthorpe and Stanley. The town is situated on the declivity of a hill sloping to the river, which is here crossed by a handsome stone bridge of nine arches. It is well built, the houses being mostly of brick; streets spacious and regular, paved, and lighted with gas; and since 1839, the town has been plentifully supplied with pure water by the W. Waterworks Company. The market-place is small, but is well supplied with butchers' meat, fruit, vegetables, and other articles.

Wakefield is one of the principal country-corn markets in England; and the new corn exchange at the head of Westgate is in all respects suitable for the dispatch of the important business of which it is the centre. On the S.W. side of Wakefield township the buildings advance in a continuous street into that of Alverthorpe, now embodied in the parl. bor.; and at the W. end of the town, and in Stanley township, are a great many buildings known by the name of East Moor, which also form part of the bor., which farther comprises the small village of Thornes on the S. The latter, in fact, is connected with the town by an almost continuous line of houses and warehouses. (*Boundary Report*.) The parish church of All Saints is a handsome edifice of English architecture, 156 ft. in length, and 69 ft. in width, founded in the reign of Henry III., but retaining few of its ancient features. It has a square tower, with battlements and pinnacles, surmounted by a spire, 237 ft. in height, said to be the highest in the co. The living, a vicarage in the gift of the crown, is worth 547£ nett. The church of St. John, in the district of the same name, erected in 1725, was, in 1815, rendered parochial jointly with All Saints; the living, a perpetual curacy, in the gift of the vicar of Wakefield, is worth 114£ a year. In 1810, Trinity Church, in George Street, built by subscription, and vested in trustees, under the Church Building Acts, was licensed for public worship. There is also a Rom. Cath. chapel, 2 places of worship for Independents, 2 for Wesleyans, and others for Friends, Primitive Methodists, Unitarians, and Baptists. In the centre of the bridge, projecting from its E. side, is a richly ornamented Gothic chapel, 30 feet in length by 21 in breadth, believed to have been founded by Edward III.; but rebuilt and decorated by Edward IV. to commemorate the death of his father, Richard, Duke of York, and his partisans at the battle of Wakefield. But (*quantum mutatus*!) this fine old building has latterly been degraded into a counting-house. In the market place is a Doric cross with an open colonnade supporting a dome, and containing a small room in which the street commissioners transact business. The music saloon, subscription library, and news room in Wood Street, is a handsome building. There, also, is a literary and philosophical society, a mechanics' institute, a masonic lodge, a theatre, &c. The new and commodious corn exchange, at the top of Westgate, contains, exclusive of the exchange and several offices and shops, a very large assembly-room, with ante-rooms. The building called the Tammy Hall, for the exhibition and sale of woollens, has long been occupied as a worsted manufactory. The free grammar-school, founded by Queen Elizabeth in 1592, and since enriched by various private benefactions, has a considerable income, and has long enjoyed a high reputation. It is open, free of expense, to the sons of the inhabitants, desirous of a classical education, and has at present (1842) upwards of 60 scholars. It has an attached writing school, and 12 bachelors to Cambridge, and 1 to Oxford. Some very distinguished personages have been educated in this school, among whom may be mentioned Dr. John Potter, Archbishop of Canterbury, author of the popular and excellent work on Grecian antiquities, a native of the town; Dr. Radcliffe, founder of the library at Oxford which bears his name, also a native of the town; and Dr. Bentley, the eminent critic and scholar, a native of Oulton, in the vicinity. The green-coat school, founded in 1707, with an income of above 500£ a year, clothes and instructs about 75 boys and 50 girls; and among other schools is a charity school for 106 poor boys and 50 girls, 2 national schools established in 1832, a school of industry, a Lancastrian and several Sunday schools, in all affording instruction to nearly 2,000 children. A proprietary school, opened in 1834, is a fine, collegiate-looking building, in which about 200 pupils receive a classical and commercial education. The West Riding Pauper Lunatic Asylum, erected in 1817, 1 m. N.E. of the town, is a noble building capable of accommodating above 400 patients. A dispensary and fever ward was established a few years since; and there are well endowed almshouses for both sexes. Wakefield had formerly an extensive manufacture of woollens and worsted yarn, but this, owing to the superior facilities for carrying on the manufacture enjoyed by other

places, or their greater attention to the business, has greatly declined: still, however, a considerable business is carried on in the manufacture of spinning worsted and in dyeing; and it is an important mart, not merely for corn but also for wool and cattle. Great quantities of wool are sent from all parts of the surrounding country to be disposed of by the wool factors; the cattle fairs held every fortnight are very extensive: malting is also carried on to a considerable extent; and there is a soap work at Walton, in the vicinity, which produced, in 1839, 1,127,527 lbs. hard soap. The coal mines in the parish employ a great many hands.

Wakefield, though in an inland situation, communicates by the Aire and Calder Navigation and various canals with Leeds, Hull, Manchester, and Liverpool; and several branch railways lead from the town to the different collieries in the vicinity. The W. Riding bank of Leatham, Tew and Co., and the Wakefield and Barnsley Banking Company, have establishments here. The North Midland Railway from Leeds to Derby passes by Oaken-slow (Wakefield station), 1½ m. S.E. from the town; and the Leeds and Manchester Railway passes the S. end of the town. The station near Kibkate is within a short distance, on the town side of the bridge over the Calder; but the most important station is at Normanton, 5 m. N.E. from the town, at the junction of the North Midland, Manchester and Leeds, and York and North Midland Railways. A very handsome hotel has been erected at this central station for the accommodation of passengers. The town is under the jurisdiction of a constable elected by the inhabitants. Quarter sessions are held in the court-house, a handsome edifice in Wood Street; and petty sessions for the district in the Court House every Monday, by the co. magistrates. A court for petty causes, and the recovery of debts under 5*l.*, is held every 3 weeks by the steward of the manor. Here is also the W. Riding Register Office; the office of the Clerk of the Peace; and the Rolls Office for the extensive manor of Wakefield. The house of correction for the W. Riding of Yorkshire is at Wakefield; it is built on an improved plan, and comprises a treadmill, 307 cells, separate yards, a chapel, &c., and is now (1842) about to be considerably improved and enlarged. The prisoners are employed in weaving coarse cloth, calicoes, &c. The Reform Act conferred on Wakefield, for the first time, the privilege of sending a mem. to the H. of C. Reg. electors in 1841-42, 899.

At the era of Domesday Survey, Wakefield, with its dependencies, was in the hands of the crown. The battle of Wakefield, fought in the vicinity of this town on the 20th of December 1460, was one of the most important gained by the Lancastrians during the civil wars; the latter, under Queen Margaret, having totally defeated the Yorkists under the Duke of York, who fell in the battle, and whose son, the Earl of Rutland, was assassinated immediately thereafter. In 1554, Wakefield was united to the Duchy of Lancaster. The manor, which extends for more than 30 m. W. of the town, including above 150 towns, villages, and hamlets, and about one eighth part of the entire pop. of Yorkshire, has belonged to the family of the Duke of Leeds since 1700, and was devised by the late duke to his son-in-law, Walter Sackville Lane Fox, Esq., M.P., the present Lord of the Manor. Market days, Fridays, and every alternate Wednesday, for cattle and sheep. Fairs, July 4th and 5th, and Nov. 11th and 12th, for horses, cattle, hardware, &c. (*Allen's Yorkshire; Baines's Gaz. and Direct. of York; Parl. Reps., and Private Information.*)

WALCHEREN, the most W. of the islands of Holland, prov. Zealand, between the E. and W. Scheldt, having on the W. the N. sea, or Atlantic, and on the E. the Narrow Channel, by which it is separated from the island of Beveland. Middleburg, the cap., in the centre of the island, is in lat. 51° 30' 6" N., long. 3° 37' 30" E. It is of a compact circular shape; length, E. and W., about 12 m.; greatest breadth, 10 m. Pop. about 45,000. The surface is quite level, and below high water mark. Its W. side, or that facing the N. sea, is defended against its encroachments partly and principally by a line of sand-hills or *dunes*, and partly (at W. Capelle) by a very strong dyke; its sides, washed by the E. and W. Scheldt, are also defended by prodigious dykes. This is the most fertile, most populous, and best cultivated of all the Dutch islands: the inhabs. are mostly in easy circumstances; and besides Middleburg, the cap., it has the towns of Flushing and Vere, and several flourishing villages. It produces excellent crops of wheat and madder, considerable quantities of the last being sent to England. The climate, though not injurious to natives, is apt to exercise an exceedingly unfavourable influence over strangers. This was strikingly exemplified in the result of the ill-fated expedition of the British troops to Walcheren under the Earl of Chatham in 1809: a great proportion of the force died on the spot from the attacks of a malignant marsh-fever; while many of those who survived had their constitutions shattered for ever. (*Géographie de Busching*, xiv. 140, Fr. ed.; *Dict. Géog.*, &c.)

WALDECK-PYRMONT, a principality of W. Germany, consisting of two separate portions, the most southerly and principal of which has Prussian Westphalia on the N. and W., while the most Northerly and smaller, including the town of Pyrmont and adjacent territory, is almost surrounded by Lippe Detmold, and Hanover. Aggregate area, 466 sq. m. Pop. in 1838, 56,480; all Lutherans, except about 500 R. Catholics and 500 Jews. Surface hilly, having a mean elevation of 1,000 feet above the sea: its mean annual temp. is about 45° Fahr. Both Waldeck and Pyrmont belong to the basin of the Weser, their principal rivers being its tributaries, the Eder, Diemel, and Emmer. About 152,300 morgen of land, or nearly 1-3rd part of the surface is covered with forests; the trees being principally beech and oak. It produces an adequate supply of corn for home consumption, with potatoes, fruit of various kinds, and flax. Cattle-breeding is an important branch of industry, and within the last 20 years the cattle have been greatly improved by crossing with the breeds of Switzerland and the Tyrol. Copper, iron, salt, alabaster, marble, slates, &c., are raised; and a large proportion of the prince's revenue is derived from the mineral waters of Pyrmont, which is one of the principal spas of Germany. Manufactures unimportant: those of iron goods, which were formerly considerable, having, of late years, greatly declined: at present the principal are those of linen and woollen stuffs, paper, leather, and rotten hosiery. The chief exports are fine wool, corn, cattle, iron, mineral waters, and a few manufactured articles.

The constitution is a limited monarchy, the diet consisting of 18 mems. of the nobility, 13 representatives of towns, and 10 deputies from the rural districts. The diet has the voting of the supplies, &c., but most part of the public business is carried on by a committee consisting of three mems. from each of the three estates composing the diet. The latter and the committee meet once a year. The territ. is divided into 5 districts. Arolsen, a town of 2,050 inhabs. on the Aar, a tributary of the Diemel, is the cap. and seat of gov.; Pyrmont, on the Emmer, one of the oldest watering-places in Europe, with about 3,000 resident inhabs., is the other principal town. Total public revenue estimated at 230,000 rix dollars a year; public debt 650,000 do. Waldeck-Pyrmont holds the 25th place in the Germ. Confeder., having one vote in the full diet, and one in the committee along with the principalities of Hohenzollern, Reuss, Lippe, and Liechtenstein. It contributes 519 men to the confederate army. (*Brighams's Illg. Länder u. Völkerrunde*, iv. &c.)

WALEIS. See ENGLAND AND WALES.

WALLS (NEW SOUTH). See AUSTRALIA AND SYDNEY. It appears from the official returns, that the pop. of New South Wales amounted, in 1841, to 128,726, having more than doubled within seven years! This extraordinary increase is principally to be ascribed to the stimulus given of late years to immigration.

WALLACHIA and MOLDAVIA (an. *Dacia Transalpina*), two contiguous principalities of S.E. Europe, nominally included in European Turkey, but in reality under the protection of Russia. They lie principally between the 41° and 48° N. lat., and the 22° and 28° E. long., and are together of a crescent shape, enclosing Transylvania on the W. and N.W. Wallachia comprises the S. and Moldavia the E. and N. parts of the united territory: the former, from the W. round to the S.E., is divided from Persia and Bulgaria by the Danube, and the latter on the E. and N. from the Bessarabia by the Pruth, and on the N.W. from the Bukowine by some branches of the Carpathians. The Sereth forms the principal line of separation between the 2 provs., the area, pop., &c. of which are as follow:—

	Area in sq. m.	Pop. in 1837-39.	Chief Towns.
Wallachia	27,500	1,747,815	Bucharest.
Moldavia	17,020	1,419,105	Jassy.
Total	44,520	3,166,920	

The two principalities have each their own peculiar government; but their history is so intimately connected, and the forms of their respective governments, the language, manners, and customs of their inhabs. have all ways been so much alike, that both may be best noticed together.

*Physical Geography and Products.*—The Carpathians, where they separate these provs. from Transylvania, usually vary in height between 3,000 and 5,000 feet, though some summits rise to 7,000 or 8,000 feet in elevation. (*Boué Turquie*.) From these mountains the surface gradually declines to the S. and E. through regions of a most picturesque character, and hill ranges and valleys of great fertility, till it terminates in a level and marshy plain from 12 to 20 leagues in breadth, which, with parts of Bulgaria and Bessarabia, constitutes what may be considered the second in point of size and importance of the great European plains. The whole country is thoroughly well watered, being intersected by

the Olt, or Aluta, Jalomnitza, Argish, Serech, and other large affluents of the Danube, most of which are navigable for a considerable distance, and which annually inundate the surrounding country. The winter is very severe, particularly in Moldavia, which prov. is open to the full force of the N.E. wind; and the Danube, with its various tributaries, is generally frozen over for 6 weeks, during which period the ice is often strong enough to bear the passage of the heaviest artillery. In the first 2 months of the year, the snow is so very thick, that the communication is every where carried on by means of sledges. A damp spring succeeds; in May the summer bursts in on a sudden, during which season, though the heat during the day be excessive, the nights are cool, or even cold. The pleasantest season is the autumn, from September to the middle of November. The climate, generally speaking, cannot be said to be unhealthy; but in the plains along the Danube endemic fevers occasionally prevail, and in the hill region goitres are extremely common. Earthquakes sometimes occur, but happily they are rarely very violent. Most part of the country towards the Danube consists of a rich alluvial soil; elsewhere, tertiary and calcareous, and in the Carpathians primary formations are prevalent. In the latter, ores of gold, silver, mercury, iron, copper, and other metals are found, and several mines were opened during the Russian occupation of these provinces. At present, except salt mines, few others are wrought, and the gold obtained is chiefly by washing the river deposits, an occupation almost solely confined to the gypsies, who pay their tribute partly in gold dust. Petroleum, sulphur, nitre, and coal are met with, but not much sought after. The salt of Wallachia, which is of the purest kind, forms an article of sale in all the bazaars of the country. Oak, pine, fir, beech, maple, elm, ash, walnut, white mulberry, &c. are the chief forest trees. The climate is unsuitable for the fig and olive; but apples, pears, plums, cherries, apricots, &c. come to perfection with little culture. Asparagus is indigenous; cabbages and artichokes grow to a great size, and cucumbers and melons are among the principal articles of food. Deer, wild goats, and hares are very numerous. Wolves, when pressed by hunger, come down from the mountains and commit much devastation among the flocks and herds; but at other times, like the bears and other wild animals in these parts, they rarely attack a man.

**Land and Agriculture.**—The land principally belongs to the nobles, or *boyars*, though it is seldom cultivated by them on their own account. No regular system seems to be pursued as respects the arrangements between the landholders and cultivators; but, for the most part, the cultivators pay to their landlords a tithe of their whole produce of corn, and, in addition to this, they are bound to pay the land-tax and other burdens, and to work 30 days in the year for their landlords. M. Hagemeister says that, though nominally free, the cultivators are virtually enslaved, and that they are still subject to great oppression. (*Commerce of the Black Sea*, 112.) Owing to their subdivision among the children, on the death of a parent, there are now but few large properties. The mode of tillage does not much differ from that in other parts of Eastern Europe. Oxen are usually employed for field labour. Manure is never used; but after a crop of corn, the land is left fallow for a season, and then sown with wheat, barley, or maize, which are the principal crops. Oats and rye are but little cultivated, maize constituting the principal part of the food of the people, and barley being used in distillation, and in the feeding of horses and poultry. No probable estimate can be formed of the ordinary produce of the wheat crops; though there can be no doubt that if the cultivators could calculate on a ready market, it might be very greatly increased. Speaking generally, the wheat of Moldavia, though inferior to that of England or Poland, is from 15 to 20 per cent. superior to that of Wallachia. In the latter prov. the wheat is mostly soft, whereas in Moldavia it is mostly hard. (*Hagemeister*, 104.)

It is extremely difficult to form any fair estimate of the price at which Moldavian and Wallachian wheat might be shipped from the Danube. The kilo, or principal corn measure, differs in the two provinces, and the value of the piastre is also constantly fluctuating; and in addition to these causes of uncertainty, the duties laid on corn when exported are liable to vary, and everybody knows how much the price is affected by variations of demand. On the whole, however, we are inclined to think that the cost of corn at Galatz (which see), the principal port of the principalities, has been materially underrated. In some years it has been as low as 15s. a quarter; but, in 1838, when 171,813 quarters were exported, the price varied from 23s. to 28s. 7d. a quarter. Perhaps, under a fair average demand, it might vary from 20s. to 22s. a quarter.

Immediately after having been gathered in, the corn is trodden out by horses and cattle, and laid up in pits, in consequence of which it acquires an earthy flavour, unfavourable to the sale in foreign markets. (*Hagemeister*,

*ubi supra*.) A good deal of wine is made on the hill slopes, particularly in Moldavia. It is mostly of very indifferent quality; but Mr. Thornton says that some of the wines are pleasant and wholesome, resembling the light wines of Provence, and that they are largely exported to Russia and Transylvania. The strength and spirit of the wine, he farther states, are increased by a process common among the rich proprietors, and practised also in Russia. "At the first approach of severe cold, the wine butts are exposed to the severity of the weather in the open air: in a few nights the body of wine is encased with a thick crust of ice; this is perforated by means of a hot iron, and the wine, thus deprived of its aqueous parts, is drawn off clear, strong, and capable of being preserved for a long time." (ii. 320.) Ovid may have had a similar practice in view when he says, of the wine at the place of his banishment,

"Udque consistunt formam servantia testæ  
Vina; nec hausta meri, sed data frusta bibunt."  
*De Trist.* l. iii. el. x. 23, 24.

The rearing of cattle, however, rather than agriculture, has always been the principal employment of the Wallachians; and the Illyrian word *czack*, signifying a herdsman, appears to have been the original root whence their name, and that of the country they inhabit, has been derived. The chief sources of wealth in both principalities are, in fact, their flocks and herds, which find abundant and nutritive pastures in winter in the plains, and in summer on the Carpathians. The number of sheep and goats in Wallachia has been estimated at 4,000,000, and the annual produce of wool in both provs. at 40,000 quintals. The latter, which is divided into 3 sorts, *cigais*, *strosser*, and ordinary, is sold at from 3 to 3½, from 2 to 2½, and from 1 to 1½ piastres the oke. There is no public establishment for the washing of wool, but private individuals sometimes wash it at home, which commonly increases the price about 40 per cent.; but the greater part is sold in the grease. Merinos have not yet been introduced into the country. About 1-6th part of the whole clip is sent to France.

The cattle of Moldavia are larger and better than those of Wallachia, for the simple reason that all branches are more backward in the latter country. Taking their size into account, Moldavia is richer in horned cattle than Wallachia, which, on the contrary, takes the lead in the number of sheep. In both the principalities the cattle and sheep are bought up by the dealers; who pasture them throughout the summer, in the view of selling or slaughtering them in August and September. A pair of good oxen commonly costs from 70 to 83 roubles; a cow is worth from 25 to 28 roubles; a sheep 3 to 4 roubles. Pasturage for a herd of 150 head is hired at a price of 150 to 250 roubles. The number of horned cattle fattened in this manner for sale may amount to 60,000 or 80,000 head. The buyers commonly advance one third or a half of the price for some months. The high price of cattle proceeds from the great consumption in Austria, into which numerous herds are annually sent, particularly from Moldavia. Bessarabia and Wallachia also furnish some, and these are always the largest and finest animals. Many of the inhabitants on the Austrian frontier are engaged in this trade. A part of the cattle, and especially the sheep, traverse the Danube for sale in Bulgaria; and previously to 1828 the number of cattle and sheep thus exported was estimated at 150,000 for Wallachia, and at 100,000 for Moldavia. (*Hagemeister*, p. 149.) There are several breeds of horses; and the best, which are those of Moldavia, are bought up in large numbers for the Austrian and Prussian cavalry. (*Thornton*, ii. 322-3.) The buffalo thrives in Wallachia, and poultry and game of all kinds are in great plenty; but the flesh of the latter, as well as beef, pork, and mutton, are said to be insipid and inferior. The skins and hare-skins are, however, of the best quality; of the last, about 500,000 are annually exported. Timber, yellow berries, butter, cheese, hides, staves, and masts of various sizes and descriptions, are the other chief articles of export: the Moldavian oak timber, which is much finer than the Wallachian, is well calculated for the construction of vessels, and many of the Turkish ships are built of it, and fitted out with masts and ropes of Moldavian growth. The yellow berries are inferior to those of Smyrna, and only in demand when the crop of Asia Minor is deficient: the export is, however, estimated at 600,000 okes a year. (*Wilkinson*, pp. 75-78, &c.)

**Manufactures and Trade.**—Coarse woollen cloth, hats, earthenware, common linen fabrics, glass, jewellery, saddlery, vehicles, &c. are made, and there are estimated to be altogether 5,000 factories of different kinds in the two principalities, inclusive of distilleries. (*Coleman, Moldavia*, &c.) But, for the most part, manufactured goods are imported from other parts of Europe, in return for the raw produce of the principalities. Galatz is the grand centre for the foreign trade of the provs., and the point whence the imported goods are sent to Bucharest and

*Jassy.* Coffee, sugar, pepper, rum, lemons, oranges, and foreign wines are the principal imports. The local consumption of the first in both provs. is estimated at 800,000 oke, of the second, 900,000 do., and of the third, 30,000 oke yearly. Cotton and woollen goods, earthenware, &c. are brought chiefly from Germany and England, and Russia supplies the principalities with large quantities of furs, taking in return spirits, wines, and specie. (*Wilkinson, &c.*)

*People and Condition.*—Notwithstanding the various irruptions of the Goths, Gepids, Lombards, Huns, Tartars, and Turks into these provs., their inhabs. at the present day appear to be, with comparatively little intermixture, the descendants of the ancient Dacians, to whom, as represented on Trajan's column at Rome, both in features and costume, Mr. Paget says, the modern Wallachs bear a remarkable resemblance. (*Paget's Hungary, &c. ii. 189.*) They still call themselves *Roumuni*, or Romans, and their country *Zara Rouman-Esha*; and it is a curious fact, that in a prov. which was among the last annexed to the Roman empire, and in a situation more exposed than any other to the irruptions of invaders from the E., the common dialect now spoken contains, together with many Slavonic and Greek terms, a very large infusion of purely Latin words; so much so that a stranger speaking in Latin is generally understood by the natives. "In appearance the common Wallach presents a decided difference from either Magyar, Slav, or German. In height he is below the medium, and generally rather slightly built and thin. His features are often fine, the nose arched, the eyes dark, the hair long, black, and wavy; but the expression is too often one of fear and cunning to be agreeable. The dull, heavy look of the Slovak is seldom seen among them, but still more rarely the proud self-respecting carriage of the Magyar." (*Paget.*) The long-continued misgovernment to which the Wallachians and Moldavians have been subject, has corrupted their morals, weakened their energies, and given them most of the vices of slaves. All the worst features of Turkish despotism were exhibited in these provs. In their most revolting and odious forms. And hence we need not be surprised, that though we without hospitality, and some other redeeming qualities, the inhabs. are treacherous, revengeful, indolent, beattod, and often cowardly. The women, indeed, on whom most of the labour devolves, do not share in the idleness of the men, but their industry exhibits much want of method and thriftiness, and "to be as busy as a Wallach woman, and do as little," is a proverbial comparison among the German settlers in Transylvania, &c. (*Paget's Hungary, &c. vi. vii.*), to which, and the art. *Hungary*, in this vol. p. 5. we beg to refer the reader.)

Mr. Paget says, "I had pitied the Wallachs of Transylvania, till I saw their brethren of the principalities of Wallachia and Moldavia. I never saw two countries of their extent so fruitful in resources. Yet, with all their advantages, I never saw a country so thinly populated, nor a pop. so excessively poor and miserable." (*ib. 467.*) The peasants' dwellings throughout the country are all built in the same style and of the same size. The walls are of clay, and the roofs thatched with straw, neither of which is calculated to protect the inmates from the inclemency of the weather. In winter the people retire to caves under ground, kept warm by fires made of dried dung and branches of trees; and which, at the same time, serve for cooking their scanty food. Each family, however numerous, sleeps in one of these subterranean habitations, their beds consisting of a piece of coarse woollen cloth, which serves in the double capacity of mattress and covering. These under-ground dwellings, have, in fact, been the winter residence of the inhabs. of Scythia from the remotest antiquity, and have been admirably described by Virgil:—

"Ipse in defosis specubus seculi sub alia  
Ovis agunt terrâ, congestaque robora totaque  
Advolvere focis ulmos, ignique decedre.  
Hic noctem ludo ducunt, et pocula læti  
Fermento aque calice imitantur vites sœbis."

Georg. iii. line 376, &c.

The ordinary food of the peasants consists of the flour of Indian corn, mixed into a dough with milk. For the first few days after Lent some indulge themselves in meat, but the greater part cannot afford this, and content themselves with eggs fried in butter. (*Wilkinson, 167-8.*) In their holidays they spend most of their time in the village wine-houses, where they amuse themselves with dancing, witnessing the vagaries of gipsies, &c. They are no longer adepts in glee, and if dissatisfied with their masters, mad, on giving due notice, quit their habitations and pass over to the estate of another, with their families and moveables: this, however, is more an apparent than a real advantage, and, as already stated, the peasants are still in a very oppressed condition. The gipsies continue in a state of regular slavery, belonging either to the government or to private individuals. Their entire number in both principalities is estimated at 150,000, about 80,000 of

Vol. II.

whom belong to the government. Some are employed as domestic servants; the rest are suffered to stroll about the country, breeding cattle or horses, manufacturing wooden and iron utensils, or employing themselves as showmen, musicians, &c. For this liberty they bind themselves not to quit the country, and pay an annual tribute of 80 plasters per man, if belonging to the government; it is said that desertions by gipsies are rare.

The nobility and clergy are in general exempted from taxes for the service of the state, and from the demands of private creditors! They are in consequence overbearing, extravagant, and dissolute. Their education has hitherto been little superior to that of the common people; and though ostentatious in their dress and equipage, their manners present little refinement. In Moldavia, which is the most civilized of these provs., the great landed proprietors bestow considerable attention to the management of their estates; but in Wallachia these are mostly left to the care of agents. The boyars who hold no place under government, spend their leisure in absolute idleness, or in visiting each other, to kill time. "They have," says Thornton, "adopted indiscriminately the vices, without inheriting the vivacity of the Greeks." This statement applies, however, rather to their past than to their present state. Of late years some considerable improvements have been introduced; and though society be still very backward, it is, at all events, much superior to what it was under the Turkish regime.

*Government, &c.* For a lengthened period these provs. were governed by *vaiodes*, or princes appointed by the Sultan from among the Greeks of Constantinople, and, during the continuance of this system, the country was a prey to every species of abuse. Since 1829, however, they have been placed under the sole protection of Russia; and whatever may be the defects of Russian policy, there can be no question that they have gained immensely by the change. The prince, or hospodar, both in Wallachia and Moldavia, is elected for life from among the boyars of the first rank, by an assembly composed of those boyars, and of deputies of the inferior boyars, the academic bodies, and merchants; but his election must be approved by Russia, and the investiture is then given by Turkey. A diet of the clergy and boyars (the class which contribute nothing to the state) meets to vote the supplies, and to discuss other propositions of the prince; but no organic changes can be made without the sanction of Russia. Wallachia is divided into 18, and Moldavia into 13 districts, each of which has a prefect or governor, a receiver-general of taxes, a civil tribunal, consisting of a president and two other judges; and Moldavia has a director of police and a town council in each municipality. Judges are removable at the pleasure of the superior authorities. The legal codes are founded upon the civil law and the customs of the principalities; but though the system of jurisprudence has been much amended, many reforms remain to be effected, especially in the administration of the laws, which is said to be most corrupt. Nearly all the pop. belongs to the Greek church, and every village has a small church or chapel, with one or more priests, who act as curates. The ecclesiastics of this order are chosen from among the people, from whom they are little distinguished in appearance, and whose avocations they follow when not engaged in their clerical functions. The generality of them can neither read nor write, and merely recite the formula of their service from memory: they have, however, an unbounded influence over the ignorant pop. of these countries. There are many large and rich monasteries, and 4 or 5 seminaries for the education of the superior clergy.

*Public instruction*, though still backward, appears to have advanced since 1832. Colleges and Lancasterian schools are established in the principal towns; and the latter have by this time probably spread into the rural districts. According to the *Journal d'Éduc.*, the higher classes in these provs. have of late set about improving their national dialect with remarkable vigour; and it appears probable that their language will ultimately be rendered much nearer akin to the ancient Roman than even the Italian. There is a printing-press at Bucharest, which is in active employment; and translations of foreign as well as original works are continually being produced by native authors. (Vol. vii. p. 173.) This is a consequence, and by no means the only salutary one, that is likely to follow the establishment of the principalities under Russian protection, or at least their enfranchisement from the debasing rule of the Turks.

The *military force* is organised on the plan of the Russian army, and the staff officers are principally Russians. The militia is formed by the peasantry, in the proportion of 2 men for every 100 families; but along the banks of the Danube all the inhabs. capable of bearing arms are organized into a military force, auxiliary to the quarantine service. The total effective force of the provs. amounts to about 53,000 men, including nearly 5,000 irregular cavalry. There is no artillery, nor are there any fortresses in either prov.

q M

The public revenues are derived from the capitation tax of 30 piastres (the piastre is about 34d. sterling) per head on the rural pop.; from 30 to 130 do. a year on the manufacturing classes, and 60 to 240 do. on merchants, &c.; from the government lands and rights of pasturage, fees, fines, customs, salt monopoly, and in Moldavia a tax on the incomes of the clergy. These sources produced in 1839, in Moldavia, 10,467,269 piastres, and in Wallachia, 16,393,299 do. In the latter prov. the expenditure nearly balanced this sum; but in the former there was a surplus of 2,797,900 piastres. Both provs. pay an annual, but not very heavy, tribute to the Porte. (*Colson, Etat présent de Moldavie, &c.*)

*History.*—Since the conquest of this country by Trajan, it has never ceased to be under foreign dominion. It was alternately in the power of the barbarians and the Greek emperors till the 13th century, when it appears to have been occupied by the Hungarians. Early in the 15th century it was conquered by the Turks, to whose empire it has since been generally tributary, but the last war between Turkey and Russia entirely destroyed the influence of the former, and rendered the latter paramount. (*Colson, Etat présent de Moldavie et de Valachie; Wilkinson's Wallachia and Moldavia; Thornton's Turkey; Boué, La Turquie; Walsh; Paget, &c. passim.*)

**WALLINGFORD**, a parl. and mun. bor., market town, and par. of England, co. Berks, hund. Moreton, on the Thames, 12½ m. N.W. Reading. The old parl. and mun. bor. were co-extensive with four small par., having an area of 370 acres, and a pop., in 1831, of 2,545. But the modern parl. bor. includes several additional par., partly in Berks. and partly in Oxfordshire, having an aggregate area of about 18,000 acres, and a pop., in 1841, of about 6,000. The modern mun. bor. is about twice as extensive as formerly. The town, 3 m. from the main road, between London and Oxford, is pretty well built, paved, and lighted with portable gas, and, for its size, contains a considerable number of neat private dwellings, and a few of a superior character. (*Bound. Rep.*) The river is here crossed by a handsome stone bridge, 300 yds. in length, with 19 arches, and 4 draw bridges, built in 1809, upon the site of a former structure of the same description. St. Mary's church has a fine tower, crowned with pinnacles, which appears to have been erected in 1559; the living, a rectory, worth 148*l.* a year, is in the gift of the crown. St. Peter's church, a handsome edifice, rebuilt about 50 years since, is surmounted by a spire: the living, a rectory in the gift of W. S. Blackstone, Esq., is worth 100*l.* a year. The living of St. Leonard's, worth 103*l.* a year, is in the gift of the crown. There are also places of worship for Friends, Independents, Wesleyans, and Baptists. The market-house and town-hall are respectable buildings. Among numerous charitable institutions are the free grammar-school, founded in 1559, and several almshouses. No manufacture of any consequence is now carried on: the chief business is that of malting; and, in general terms, Wallingford "may be described as a neat country town, respectfully inhabited, and a place of no other importance than as the market-town for the surrounding country." (*Bound. Rep.*) It is a bor. by prescription, its earliest existing charter being a copy of one dating from the reign of Hen. I. It has returned 2 mems. to the H. of C. since the 23d. of Edw. I.; the right of voting, previously to the Reform Act, having been vested in individuals paying church and poor rates. Registered electors, in 1839-40, 368, under the Mun. Reform Act; it is governed by a mayor, 4 aldermen, and 12 councillors, and other officers. It has a commission of the peace, court of record, court leet, and a gaol for the confinement of offenders before committal.

**WALSALL**, a parl. and munic. bor. and par. of England, co. Stafford, hund. Offlow, on a small tributary of the Tame, in the centre of one of the principal coal and iron districts, 7 m. N.W. Birmingham. Area of par., 7,920 acres, all of which is included in the parl. bor., except an outlying portion called Walsall Wood. Pop., in 1831, 18,666. It is situated on the declivity and summit of a low hill, and is pretty well built, having "the appearance of a compact and flourishing town; several houses of the value of from 20*l.* to 40*l.* a year are now building, and every indication of a thriving community is here exhibited." (*Municipal Bound. Report*, 1837). The main streets are broad, well paved, lighted with gas, and well supplied with water; though there be but little that is prepossessing in their general appearance. In the environs, however, there are many handsome villas, with some picturesque scenery. Bloxwich, about 2 m. N. from the town, but included in the parl. bor., is a populous village, the inhabs. of which, like those of Walsall, are mostly occupied in the hardware manufactures. The parish church occupies a commanding situation on the top of the hill: it is an ancient, spacious, cruciform structure, with a tower surmounted by a lofty spire; and was thoroughly repaired in 1821. The living, a vicarage worth 288*l.* a year, is in the gift of the Earl of Bradford, lord of the manor. St. Paul's

chapel, a handsome Grecian edifice, completed in 1826, is a perpetual curacy worth 50*l.* a year. There are places of worship for Independents, Wesleyans, and Unitarians, and 2 Cath. chapels, one of which is a handsome Greek building. The subscription library, established in 1800, has recently been enlarged: it contains reading and news rooms, and has a Doric colonnade, 30 ft. in height. The grammar school, founded and endowed by Queen Mary, in 1557, open to all the boys of the parish, has an annual income of 780*l.*; and subsidiary schools, dependant on the principal, have been established in different parts of the par. It has also an English school in which 120 boys are instructed; a blue-coat charity; a National and several Sunday schools; and numerous charitable benefactions for the relief of the poor. In the time of Henry VI. an endowment was left for the annual distribution of 1*l.* to every person in the par.; but, in 1825, this useless endowment was judiciously appropriated to the erection and maintenance of 11 almshouses. Walsall is said to have been a bor. by prescription: its earliest existing charter was granted by Henry VI. Under the Municipal Reform Act, it is divided into 3 wards, and is governed by a mayor, 5 other aldermen, and 18 councillors. The Reform Act conferred on it, for the first time, the important privilege of sending 1 mem. to the H. of C. Reg. electors, in 1839-40, 837.

It has a commission of the peace, a weekly court of petty sessions, and a Court of Record for the recovery of debts between 40*l.* and 20*l.* The jail is of a very different description. Its command of coal and iron has made Walsall a considerable seat of the hardware business: the manufacture of saddler's ironmongery, that is, the making and plating of bridles, spurs, and stirrups, the mountings for coach and carriage harness, &c., being the staple employment of the town. It has, also, some brass and iron foundries, and a considerable trade in malt. A branch of the old Birmingham canal comes up to the W. end of the town, which is 3½ m. from Willenhall station on the Grand Junction Railway. The Bank of Walsall and S. Staffordshire, established in 1835, has its principal office in this town. Walsall, though not mentioned in Domesday book, is known to be a town of considerable antiquity; but is not connected with any historical event of importance. Market day, Tuesdays, Fairs, 24th Feb., Whit Tuesday, and the Tuesday before Michaelmas; the two latter are mostly for cattle and cheese. (*Parl. Rep. and Priv. Inf.*)

**WALSHAM (NORTH)** a market-town and par. of England, co. Norfolk, hund. Tunstead, on a level, about 6 m. from the sea, and 13 m. N.N.E. Norwich. Area of par., 4,010 acres. Pop. of do., in 1831, 2,615. The town consists of three streets which meet so as to form an irregular triangle. The par. church is a large venerable old edifice. Its tower fell down in 1724; but it has a fine south porch of flint and stone, and a font with a very rich wooden cover, of tabernacle work. The vicarage is annexed to the rectory of Antingham; the livings being, together, worth 336*l.* a year: patron, the crown. Here are several dissenting chapels, a free grammar-school, with an income of nearly 250*l.* a year, which Lord Nelson was partly educated; a Sunday-school, with a small endowment, and several minor charities. The market-cross, originally erected in the reign of Edward III., was rebuilt in 1600. Two annual courts-baron are held here, and petty sessions for the hund. by the co. magistrates. Market-day, Tuesday. Fairs, three times a year, chiefly for cattle and the hiring of servants. In 1600, this town was visited by a most destructive fire, which consumed 118 houses, besides barns, stables, &c. On Walsham heath, near the town, is a stone cross, erected to commemorate a victory of Henry Spencer, bishop of Norwich, over a band of rebels, in 1382. (*Beauties of England and Wales*, vol. xi.: *Parl. Reports*, &c.)

**WALTHAM ABBEY**, or HOLY CROSS, a market-town and par. of England, on the W. border of the co. of Essex, hund. Waltham, on the Lea, 11½ m. N.N.E. London. Area of par., 11,870 acres. Pop. of do., in 1841, 4,500. The town, originally founded in the time of Canute, consists chiefly of one spacious and irregular street. The church was formerly the nave of the church of an opulent and famous monastery, founded here by Harold II., of which there are now but few remains. This venerable relic, though much disfigured and mutilated, contains some most interesting specimens of the ornamented columns, semicircular arches, and other characteristics of the Norman style of architecture. It is about 90 ft. in length, by about 48 ft. in breadth. At the W. end is a heavy square embattled tower, 86 ft. in height; but this is comparatively modern, and bears the date of 1558. The inside of the church bears witness to the iconoclastic zeal of the Reformers, and to the bad taste and miserable parsimony of those by whom they have been followed: the ornamental parts having been defaced and whitewashed, and the brasses torn from the gravestones. Harold, and his two brothers slain with him at the battle of Hastings, were interred in this church. The living, a curacy worth 237*l.* a year, is in

the gift of the trustees of the Earl of Norwich. The Baptists and Wesleyans have, also, places of worship. The educational and charitable institutions comprise a free school for 20 boys and 20 girls, with an endowment producing about 160*l.* a year; another endowed school, for the education of 5 boys, and several bequests for the support of Sunday schools, almshouses, and the general relief of the poor. The revenues of the monastery amounted, at its dissolution in 1539, to 900*l.* according to Dugdale, and to 1,080*l.* according to Speed. Market-day, Tuesday; fairs, twice a year. At present, however, the town derives its entire importance from the gunpowder mills established here on account of government. These, which were originally acquired from private parties in 1787, consist (in 1842) of 4 mills, each having 2 pair of stones. The moving power is water; the establishment is, in all respects, in the most efficient state, and the powder produced of the very best quality. During peace the consumption of powder by government amounts to about 10,000 barrels a year, of which about 8,000 are supplied by the works now under consideration. The latter, however, were not erected in the view of providing the entire supply of gunpowder, which, in periods of war, sometimes exceeds 80,000 or 100,000 barrels a year; but partly as a check on the combinations of the manufacturers, and partly as affording the means of readily trying and fairly appreciating such new discoveries and experiments as may from time to time be made or suggested in the preparation of so important an article, and in these respects they have been completely successful. At Enfield Lock, about 2 m. below Waltham, a manufactory of small arms is also carried on upon account of government. At present (1842) it is almost wholly occupied in the making of new percussion muskets, of which it supplies about 10,000 a year. (*Private Information*.)

In the hamlet of West Waltham, or Waltham Cross, about 1 m. W. from Waltham Abbey, in Hertfordshire, is one of the stone crosses erected by Edward I., at the different places where the corpse of his beloved wife, Queen Eleanor, rested on its way from Hareby, near Grantham, where she died, to Westminster Abbey. Only 3 of these crosses now remain. It had originally been a very fine structure; but the ornaments are now much defaced. (*Beauties of England*, vols. vii. and x.; *Farmer's History of Waltham Abbey: Parl. Papers*, &c.)

WALTHAMSTOW, a village and par. of England, co. Essex, hund. Precentree, on the Lea, a tributary of the Thames, 5 m. N.E. London. Area of par. 3,600 acres. Pop. of do., in 1831, 4,258. The village, on the borders of Epping Forest, is formed by the union of several hamlets; the houses, among which are many villas and country seats, being generally detached, and interspersed with trees and gardens. The church, built on an eminence, is a spacious structure in a mixed style of architecture, with a tower at its W. end: it was repaired and enlarged in 1817, and has several ancient monuments. The living is a vicarage, to which is attached the curacy of St. John's, being worth, together, 772*l.* a year; patron, W. Wilson, Esq. The Unitarians and Independents have each chapels; and to the latter a school is attached, in which 30 girls are educated, 20 of whom are clothed at the expense of the foundation. The free school, founded in 1542, has an endowment yielding 85*l.* a year. Although established for the education of more than 30 pupils, it was lately attended by only 5. It has also national and infant schools, with numerous well endowed almshouses, and benefactions to a considerable amount, for the relief of the poor. Some copper mills and other works are established in this par. on the banks of the Lea. The par. has an exclusive local jurisdiction; and is governed by a council of 17 members, presided over by the vicar and churchwardens. Courts leet and baron are held here when required. (*Guide to London and its Environs*, &c.)

WANDSWORTH, a large village and par. of England, co. Surrey, hund. Brixton; on the Wandie, near its confluence with the Thames, 5 m. S.W. London. Area of par. 1,820 acres. Pop. of do. in 1831, 6,879.

Wandsworth consists principally of one broad thoroughfare, between 2 emineces called the E. and W. hills. "It is in parts noisy and bustling, in other parts rural and quiet; in parts clean and pleasant, in others low and dirty; and the residents are for the most part in the extremes of rich and poor." (*Guide to London and its Environs*.) The old church, which was mostly rebuilt in 1780, is a plain brick edifice with a heavy square tower at its W. extremity; the living, a valuable vicarage worth 840*l.* a year, is in the gift of W. Borrodale, Esq. The new church of St. Anne, erected by act of parliament in 1824, is an elegant edifice of Grecian architecture, with a handsome portico and a steeple of 3 circular arches; the living, a curacy worth 162*l.* a year, is in the gift of the vicar of Wandsworth. Here also are meeting-houses for Friends (to which 2 schools are attached), Baptists, Independents, and Wesleyans. The free endowed school, founded in 1710, has been in-

corporated with the national school, and affords instruction to above 200 boys and 100 girls, to some of whom clothing is supplied. It has also a Lancasterian school, in which more than 200 children are educated. A school of industry, attended by 40 girls, and various other charities, among which those of Alderman Smith, a native of the town, who died in 1627, are the most valuable. The manufactures of Wandsworth are more considerable than might have been expected: that of hats was introduced by the French refugees towards the end of the 17th century; and there are works for bolting cloth, printing calicoes and kerseymeres, making coach and livery lace, dyeing (especially in scarlet), with corn, oil, iron, and white lead mills, vinegar works, and distilleries. The Southampton railway passes a little to the E. of the village. Petty sessions for the hund. are held weekly, and there is a court of record for the recovery of debts under 5*l.* Fairs on the first 3 days of Whitsun week, for horses, cattle, pigs, and toys. (*Beauties of England and Wales*, Surrey; *Guide to Env. of London*, &c.)

WANTAGE, a market-town and par. of England, co. Bucks, hund. Wantage, is a small town, situated on the E. extremity of the Vale of the White Horse, 22½ m. W.N.W. Reading. Area of par., which includes the hamlets of Charlton and Grove, 7,530 acres. Pop., in 1831, 3,282. The town is irregularly built at the intersection of the high roads from Hungerford to Oxford, and from Farringdon to Wallingford, which form its principal streets. The church, a handsome cruciform structure, has a square embattled tower rising from its centre, and some fine monuments. The living, a vicarage, worth 533*l.* a year, is in the gift of the Dean and Canons of Windsor. It has also places of worship for Independents and Wesleyans; a free grammar-school, with an income of about 200*l.* a year; some almshouses, founded in 1650, with an endowment of 100*l.* a year, Sunday-school, &c. The town lands produce an income of about 450*l.* a year, which is spent on the relief of the poor, the repair of highways, and the support of a school. Sacking, twine, and tarpaulins are manufactured on a small scale. The market is celebrated for its fine corn, a great deal of the best seed-wheat being brought thither by the Vale farmers. Its trade is facilitated by a branch of the Wilts and Berks canal, which comes up to the town. Wantage was made a bor. after the Conquest; but it no longer retains that distinction. A manorial court is, however, held in it once a year, and petty sessions for hund. every Saturday.

WARDEIN (GROSS or GREAT; Hungar. *Nagy-Farad*), a fortified town of Hungary, co. Bihar, of which it is the cap.; on the Körös, towards the borders of Transylvania, 39 m. S.W. Debreczin. Pop. estimated in the Austr. Nat. Encyc. at 10,000; but, according to Berghaus, it amounts, including its suburbs, to upwards of 16,000. It is the residence of a R. Cath. and a united Greek bishop, a Greek protopapas, &c., and the seat of the co. assembly, council, a commissariat department, &c. It has a royal academy, many other superior schools, an abbey, and various religious establishments, with manufactures of silk stuffs and earthenware. Mr. Paget says, "Gross Wardain is really one of the prettiest towns I have seen for a long time. Its wide well-built streets of one-storied houses, and extensive market-places, are quite to the taste of the Magyar, who loves not the narrow lanes, and high houses of his German neighbours. But the glory of Gross Wardain is in its gilded steeples, its episcopal palace, its convents, and its churches; and, although of the latter, the 70 which it formerly boasted are now reduced to 22, they are quite sufficient for the nabs. Prince Hohenlohe, of miracle-working memory, is now the occupant of this see. His elevation to the bishopric has, however, completely extinguished the light of miracle!" (*Paget's Hungary*, &c. ii. 518.)

WARE, a market town and par. of England, co. Herts, hund. Braughin, on the great N. road, and on the Lea, 18½ m. N. London. Area of par., 4,430 acres. Pop., in 1831, 4,214. It consists chiefly of one thoroughfare, nearly a mile in length, and lined in general with substantial and well built houses. The church is a large cruciform structure, mostly in the decorated and perpendicular styles; it has an embattled tower at the W. end, and within are several fine monuments, and a handsome font. The living, a vicarage, annexed to that of Thundridge, worth 835*l.* a year, is in the patronage of Trinity Coll. Camb. Here are also chapels for Independents, Wesleyans, and Friends. The market-house, supported on arches, comprises a good assembly-room. The educational and charitable institutions include a free grammar-school, of very old foundation, attended by about 30 pupils; another free school, with a small endowment, established in 1834; a national, and two other schools, chiefly supported by subscription; numerous almshouses, a lying-in charity, and funds for distribution among the poor, yielding an income of 330*l.* a year. (*Analytical Digest of Charity Reps.*) Ware has a considerable trade in corn, and maiting is extensively carried on. It is governed by 3 constables and 4 head-

boroughs: petty sessions, for the division, are held weekly, and a court-baron once a year. Market-day, Tuesday. Fairs twice a year for horses and cattle.

Chadwell spring, near the town, assisted by a cut from the Lea, gives rise to the New River, an artificial stream brought from Hertfordshire, for the supply of water to the metropolis. Though the source of the New River, in a direct line, be not more than 20 m. from London, its course, including its windings, is nearly 40 m. This important work was completed in 1613, principally by the exertions of the famous Sir Hugh Middleton. Though very unproductive at first, it has since been a source of vast wealth to its proprietors, as well as of advantage to the city.

WAREHAM, a parl. and munic. bor., market town, river-port, and par. of England, co. Dorset, hund. Winfrith, in Blandford div., on a peninsula between the rivers Frome and Piddle, about 1 m. above their confluence with Wareham harbour, the most westerly arm of Poole harbour, 30 m. S.S.W. Salisbury, and 102 m. S.W. London. The modern bor. includes the whole of the 3 pars., portions only of which were comprised in the ancient bor., together with those of Corfe Castle and Bere-Regis, and parts of two other adjacent parishes: having a total area of 22,890 acres, and a pop., in 1831, of 5,774.

The site of the town, shelves gradually towards the S., and it is mostly surrounded by flat marshy land. Having been nearly destroyed by fire on the 25th July, 1762, it has been built on a regular plan, and consists chiefly of 2 wide streets, intersecting each other at right angles. The houses, built of brick, and tiled or slated, are generally in good condition. It is surrounded by a remarkable ancient mound, the space between which and the town is now laid out in market gardens. Each of its rivers is here crossed by a bridge, that over the Frome being a handsome structure, erected in 1779. Down to a late period it was never watched nor lighted. (*Bound. and Municipal Reports.*) Of 8 churches which formerly existed here, only 1, St. Mary's, is now used for public worship, though 2 more, Trinity and St. Martin's, are made use of for other purposes; the former being converted into a national school, and the latter being merely used for reading the funeral service. St. Mary's, a spacious and ancient edifice, originally attached to a priory, is built in a mixed style, though principally of the decorated character. (*Rickman.*) It has a handsome tower, and contains some ancient monuments. All the livings of Wareham are now united in one rectory. Two more ancient churches that had fallen to decay, were taken down within the last century, and on the site of one of these the present town hall has been erected. The Independents, Wesleyans, and Unitarians have each places of worship. The educational and charitable institutions comprise a national school, held in the old church of the Holy Trinity; a small endowment for the education of 30 poor children; almshouses for 6 men and 4 women, and some minor charities.

The trade of Wareham consists chiefly in the export of the fine clay found in its neighbourhood to the Staffordshire and other potteries, and in the shipping of vegetables from the market gardens round the town for Poole and Portsmouth. A good many of the inhabs. are also employed in knitting stockings, and in the manufacture of shirt buttons. The port, which was formerly considerable, is now nearly choked up, being only accessible to vessels of from 25 to 30 tons; but vessels of 60 tons ascend to within about 1 m. of the town, and those of 200 tons may anchor at Russell's quay, about 3 m. from the town. "The inhabs. may be said to consist of persons of middling circumstances, and a few retired officers and independent persons, retail tradesmen, and men deriving a subsistence from the small craft. There is no poverty in the place, but its pop. and the number of its houses are probably less now than formerly." (*Parl. Bound. Report.*) We doubt, however, whether there be any good foundation for this surmise. The borough returned 2 mems. to the H. of C. from the 13th of Edward I. down to the Reform Act, the right of voting being exercised, since 1747, by the inhabs. paying scot-and-lot; but under the act now referred to, it returns only 1 mem. along with Corfe-Castle, Bere-Regis, &c. Reg. electors, in 1839-40, 428. The bor. has a commission of the peace, a court leet, held annually; and a court of record, opened monthly, but now of little utility. Market day, Sat. Fairs 9 times a year, mostly for cattle, cheese, and hogs. (*Bound. Rep.; Mun. Corp. Append., &c.*)

WARMINSTER, a market-town and par. of England, co. Wilts, hund. Warminster, on the Willey, at the W. extremity of Salisbury Plain, 30 m. N.W. Salisbury, and 18 m. S.E. Bath. Area of par., 5,450 acres. Pop. of ditto, in 1831, 6,106. The town consists chiefly of one spacious, clean, and well-paved thoroughfare, nearly 1 m. in length, the houses being mostly of freestone. The church of St. Denis is a spacious structure, in the perpendicular style, with a square central tower; the living, a vicarage worth 324*l.* a year, is in the gift of the Bishop of Salisbury.

The new church, erected in 1830, partly by subscription, and partly by a grant from the parliamentary commissioners, is a perpetual curacy, worth 100*l.* a year, in the gift of the vicar of Warminster. Besides a chapel of ease, there are several dissenting places of worship; a free-endowed grammar-school, affording instruction to 20 boys, with national and Lancastrian schools, supported by subscription. Warminster had formerly the most extensive trade in malt of any town in the W. of England; and this branch of industry, though it has declined, is still largely carried on. The manufacture of broad cloths and kerseymers has been, in a great measure, superseded by that of silk, in which many women and children are employed. The trade in corn is considerable; the market being one of the most extensive in this part of the country. The town is under the jurisdiction of a high constable, deputy constables, and tything-men, chosen at the annual manorial court. The quarter sessions for the co. are held here in July; petty sessions monthly, by the co. magistrates; and a court of requests for the recovery of debts under 5*l.*, is held alternately in this town and Westbury. Warminster is supposed to have been a Roman station, from the discovery of coins, weapons, a tessellated pavement, and other antiquities in the vicinity. Market-day, Saturday; fairs, 3 times a year, for cattle, sheep, hogs, and cheese.

The manor and lordship of Warminster is the property of the Marquis of Bath; and about 4½ m. W. from the town on the confines of Somersetshire, is Longlatton House, the truly magnificent seat of that nobleman. The park in which it is situated is of great extent, and is finely laid out. (*Beauties of England and Wales, &c.*)

WARRINGTON, a parl. bor., market town, and par. of England; co. Lancaster, hund. W. Derby, in a low situation on the Mersey, here crossed by a stone bridge, 17 m. E. by S. Liverpool. Area of par. 12,260 acres. Pop. in 1831, 19,155, in 1841, 21,857. The parl. bor., however, comprises only the townships of Warrington and Lachford, with portions of that of Thelwall, and may have at present (1842) a pop. of about 20,000. The town principally consists of four main streets, one or two of which are spacious and contain some handsome buildings; but the other streets are for the most part narrow and badly drained, and very little appears to have been done for the improvement of the town, except its being paved and lighted with gas in 1821. (*Bound. Rep., &c.*) The most important public buildings are the sessions-house erected in 1820; the market-hall over which are the assembly rooms; three cloth halls, theatre, &c. The par. church, which is of Saxon origin and existed at the time of the Conquest, is a large massive cruciform structure. The tower, which rises from the intersections of the transepts, was rebuilt in 1696; the interior of the church, which is lofty and handsome, contains two chapels and some fine ancient monuments. Beneath the chancel has lately been discovered an ancient crypt, now converted into a vestry. At the entrance of the churchyard are two handsome gates. The living, a rectory, has under it the perpetual curacies of St. Paul and the Holy Trinity. There are two R. Cath. chapels, founded severally in 1823 and 1836, and ten other places of worship for different sects. The free grammar-school, founded by Sir T. Boteler in 1526, has an annual income of between 700*l.* and 800*l.*; but at present (1842) it is attended by only about 28 day scholars and 12 boarders. The blue-coat school, established in 1677, has since received legacies and benefactions amounting to upwards of 2,000*l.* and has now an annual income of 450*l.*; 30 boys and 20 girls, children of settled inhabitants of the town, are lodged, maintained, and clothed in the building, and 170 boys and 40 girls admitted as day scholars. A general subscription library was established in 1758. A society was formed here early in the last century for the purpose of affording assistance to widows and orphans of clergymen in the archdeaconry of Chester; and the relief dispensed by it amounts at present to about 1,000*l.* a-year. A handsome building, in the Elizabethan style of architecture, is in progress for the education of the orphan daughters of clergymen. A dispensary and branch of the Royal Humane Society are among the other numerous charities, and there is a small but commodious infirmary, to which two wards for cases of fever are attached.

The appearance of Warrington is far less bustling and animated than formerly. Until the opening of the railway it was the great thoroughfare between Manchester and Liverpool; 70 public carriages daily passing through it between these great emporiums, whereas at present (1842) there is not one! Its traffic with the above towns is, however, very considerable; for though not strictly speaking a port, it possesses, by means of the Mersey and Irwell Navigation, many of the advantages of a port. At spring-tides the Mersey rises from 70 to 12 ft. at Warrington bridge, and vessels of from 70 to 100 tons burthen navigate the river up to this point. The Warrington and Newton railway, a branch of that between Manchester and Liverpool 4½ m. in length, was

completed in 1831, at a cost of 65,000*l*. It now forms a portion of the Grand Junction line.

Warrington is distinguished by the number and variety of its manufactures. The making of sailcloth and sack- ing was formerly carried on here upon a very large scale, but it is dwindled to insignificance. At present, among the many that are carried on, cotton spinning and power loom weaving occupy a prominent place. In 1838, there were six cotton mills at work in the parish, employing in all 1136 hands. (*Rep. on Mills and Factories.*) The refining of sugar, though not entirely relinquished, is not a leading branch of industry; but the soap manu- facture continues to be of considerable importance, 205,011 lbs of soft soap having been made in the town in 1839. The manufacture of flint and plate glass is carried on upon a large scale, and has long ranked among the principal busi- nesses of the town. Warrington is also the principal seat of the manufacture of "Lancashire tools," under which designation are comprised files of the very best quality, chisels, graver's tools, watch and clock maker's tools, &c., and in some of its factories may be seen col- lections of the articles in question of unrivied excel- lence. Pin-making is also carried on; and Warrington has long been celebrated for its malt and ale. The soil, too, in the neighbourhood being especially suitable for horticultural purposes, gardening is here well understood and successfully practised. The government of the town is vested in police commissioners and constables chosen annually in October at the court leet of the lord of the manor, acting under the superintendence of the magis- trates of the hund. Petty sessions are held every fort- night. The Reform Act conferred on Warrington, for the first time, the privilege of sending 1 mem. to the H. of C. Reg. electors, in 1839-1840, 633. Market days, Wed. and Sat. Fairs, 18th July and 30th Nov., each lasting 10 days, for horses, cattle, and cloth, and every other Wed. for cattle. (*Baines's Hist. of Lancaster & Environs; Pop. Inform.*)

WARSAW, *Pol. Warsaw, Fr. Varsovie*, the cap. city of Poland, palat. Masovia, on the Vistula, 650 m. S.E. Petersburg, lat. 52° 14' 28" N., long. 21° 2' 47" E. Pop., in 1839, including its suburbs, 139,671. The city, which, with its gardens and suburbs, covers a great ex- tent of ground, is on the left or W. bank of the river, which is here about as broad as the Thames at Westmin- ster bridge, being connected with the suburb of Praga on the right, by a bridge of boats. A suspension bridge was some years since projected instead of the latter, but the project has not hitherto been carried into effect.

Warsaw, being situated partly in a plain and partly on an ascent gradually rising to the river's bank, has a mag- nificent appearance from the Petersburg road. But though the contrary has been affirmed by some travellers, the impression of grandeur is not supported on entering the town. It has, indeed, many fine palaces, public buildings, and noble mansions, and, latterly, its private houses have been improved, by prohibiting the construc- tion of new buildings of wood. But its streets, though spacious, are badly paved, badly lighted, and dirty; the greater part of the houses in the city, and still more in the suburbs, are mean and ill constructed, above one fourth part of their number being at this moment of wood; and the whole town exhibits a painful contrast of wealth and poverty, civilisation and barbarism, luxury and misery. The suburb of Praga, on the E. bank of the river, once strongly fortified and extensive, is now all but deserted. There are still, however, several other suburbs of large extent; and those adjacent to the city- proper are included within its rampart and ditch.

The principal public building is the *Zamek*, a huge edifice, formerly the palace of the kings of Poland, and that in which the emperor has usually resided when he visits Warsaw. The hall of the Polish diet, a splendid gilt ball-room, and the national archives of Poland, are in this building; but the fine paintings of Canaletti, Bac- ciarelli, &c., with the library and other treasures, have been removed since 1831 to the Russian capital. There are several other royal palaces. That called the palace of Casimir, which was appropriated to the university, has in its square a statue of Copernicus. The Palais de Saxe is a large building in one of the finest squares. "At the back of this palace are the principal public gardens in the interior of Warsaw, which resemble in some respects the park at Brussels, though con- siderably larger. Another handsome public garden, much frequented at the fashionable hour of 10, belongs to what is called the government palace. This latter is, perhaps, one of the most chaste and really beautiful architectural elevations in the Polish capital. It is strictly in the Italian style, and contains the national theatre, custom-house, high tribunals, and offices of the minister of the interior. The palace of the minister of finance, which is quite modern, forms, with the new exchange, a very imposing object at the end of the street leading to the Brestlau gate. The Marleville bazaar is a large square, the four sides of which consist of covered arcades, with dwellings for the merchants

above, and shops for the merchandise under them; the latter amount to about 300, besides several warehouses. A great number of churches are to be found in the city; some of which are of really colossal dimensions, as the cathedral of St. John, and the church of the Holy Cross. In the former are an altar-piece of great merit by Palma Nova, and a large standard wrested from the Turks by Sobieski at the siege of Vienna. The Lutherans have also a magnificent church, erected at an expense of 25,000*l*, and superior in beauty and boldness of design to all the Catholic churches in the place, having a dome and tower of prodigious elevation. Which way so ever a traveller turns, he cannot fail to pass some one of the monuments which stand in the squares to commemorate the reign of a sovereign, or the achievements of a Polish warrior. The colossal statue of Sigismund III., cast in bronze, gilt, and placed on a lofty pillar of marble of the country, produces a very good effect; and the equestrian group in bronze of Poniatowski, &c., by Thorwaldsen, another monument worthy of admiration.

"Independently of the public gardens, Warsaw may be said to have in its vicinity some of the finest drives and promenades in Europe for width and extent. The numerous avenues of the Ujazdow, planted with lofty lime and chestnut trees, are the rendezvous of nearly the entire pop. of Warsaw on Sundays and other holidays, and are admirably calculated for horse and sledge races, both of which take place here. In the immediate vicinity is the royal villa, formerly the country residence of Stanislaus Augustus. The palace is built in the Italian style: Bacciarelli's paintings decorate one of the principal rooms; and it has a ball-room, ornamented with colossal statues in white marble; a chapel, with some curious works in mosaic, &c. In the park is a stone bridge, on which is erected the equestrian statue of John Sobieski. The view of the Vistula from the park is very fine; and a large island lying in the middle stream is much frequented in summer by the amateurs of aquatic excursions." (*Grange's*, ii. 56.)

Among the other public buildings, may be specified the Radziwil and Krasinski palaces, the barracks, mint, six hospitals, five theatres, and several good inns. Since the late insurrection, a strong citadel has been erected partly in the view of protecting, but more of overawing the town. This citadel was built from the produce of a loan raised in Poland; and, in 1835, when the emperor Nicholas visited Warsaw in his way from the congress at Toplitz, he distinctly informed the civic authorities that, on the first disturbance breaking out in the city, the guns of the citadel should level it with the ground! A cast-iron obelisk has been erected in the citadel in honour of the late emperor, inscribed "To Alexander, the Conqueror and Benefactor of Poland!"

The university of Warsaw, established in 1816, had faculties of theology, jurisprudence, medicine, philo- sophy, belles-lettres, and fine arts, and a library contain- ing, it is said, 150,000 vols. of printed books, exclusive of rare MSS., with an observatory and botanic garden, cabinets of natural philosophy, zoology, minerals, models, and coins, and printing and lithographic presses. Un- fortunately, however, the university no longer exists, having been suppressed subsequently to the late ill-fated insurrection, its fine library being then, also, removed to Petersburg. Of late years there has been a R. Catholic college at Warsaw, with twelve professors; but the ad- herents of the Russo-Greek church are rapidly increas- ing here, as in all other countries subject to Russia, and have now a cathedral and other churches in the city. The Jews, of whom there are about 25,000, have several synagogues; the Armenians, too, have their places of worship, and the English have a chapel. Among the educational establishments, are numerous superior, special, and elementary schools; all of them being modelled on the new system, and having attached to each a native Russian, as a teacher of his own language, a considerable proficiency in which is now an indispensable qualification for holding any public office, how trifling soever.

Warsaw has, also, a deaf and dumb asylum, a musical conservatory, societies of friends of literature and natural science, a bible society, &c. and some news- papers and other periodical publications. These, how- ever, are subjected to a rigorous censorship, and are, consequently, worth little or nothing. Its manu- factures comprise woollen and linen cloths, saddlery, lea- ther, carriages of different kinds, ironmongery, paper, and tobacco, with chemical and cotton printing works, and numerous breweries. Warsaw is the great com- mercial entrepôt for Poland; and has two large annual fairs, in May and Sept., attended by traders from many parts of Europe and Asia, five banks, an assurance society, &c.

In comparing this city with Petersburg, Dr. Granville says, "There is a notable difference between the general aspect of the inhabs. of Warsaw and those of the cap. he had just left. The women here are handsomer than the men: at Petersburg the impression I received was of an opposite nature. The absence of those semi-Asiatic costumes, which are so prevalent in all the streets of the

Russian cap., tends, in a great measure, to give to the cap. of Poland a more European aspect; but there is something else that contributes to produce that effect. The Poles are uniformly merry; they are loud chatters, fond of amusement, and as partial to living in the open air, doing nothing, as the Parisian *fainéants* and the *habitués* of the Palais Royal, the Tuilleries, the Boulevards, or the Luxembourg; to which class of people I should be tempted to compare them in many respects. They also do business differently: their shops and public places of amusement are more like those of any other European city farther S.; and their *ménage* appears to be much nearer to that of the French than of the Russians." (*Granville*, li. 527, 528.)

Warsaw, though a very ancient town, was not the cap. of Poland till 1566, after the union with Lithuania; when the Polish diet was transferred to it from Cracow. The city was occupied by the Swedes in the middle of the 17th century, and surrendered, without opposition, to Charles XII. in 1703. In 1793, the inhabs. expelled the Russian garrison previously in occupation; and the town was successfully defended against the Prussians, in the succeeding year, by Kosciuszko. But the suburb of Praga, being soon after taken and sacked by the Russians under Suwarrow, by whom a large proportion of the inhabs. were put to the sword, the city, threatened with a similar fate, submitted to the conquerors. In 1795, Warsaw was assigned to Prussia: in 1806, she was made the cap. of the grand duchy of Poland; and in 1815, she became the cap. of the new kingdom of Poland. She was the principal seat of the ill-fated insurrection of 1831, which has entailed so much mischief on her and the rest of Poland. (*Malte Brun, Tableau de Pologne; Dict. Géog.; Granville*, &c.)

WARWICK, a co. of England, situated nearly in the centre of the kingdom, having N.E. the co. of Leicester, E. Northampton, S. Oxford and Gloucester, W. Worcester, and N.W. Stafford. It contains 574,089 acres; of which above 500,000 are arable, meadow, and pasture. The northern and largest part of Warwickshire was formerly an extensive forest, and still retains something of its former character, being interspersed with heaths and moors, and sprinkled with woods; but the former have greatly diminished within the present century. The S. portion is in general very fertile. Both the dairy and grazing systems are successfully practised, but the former has been gaining on the latter. The long-horned breed of cattle is preferred for the dairies; the average produce of a cow being about 2½ cwt. of cheese. Short-wooled sheep have been almost entirely banished from this co. The standing sheep stock is supposed to amount to about 350,000 head, and the produce of wool to be between 8,000 and 9,000 packs. Arable husbandry is not so well understood as grazing; and in some districts it is far behind. Wheat, barley, oats, and beans, are extensively cultivated. The first is generally drilled, and when such is the case, it is not a little singular that turnips should be almost everywhere sown broadcast, and beans generally dibbled. The system of top-dressing is more commonly followed in this than in any other co. Estates of various sizes; some very large, and others small. Farms vary from 80 to 500 acres; but the smaller class predominate so much, that the average is not supposed to exceed 150 acres. Old enclosures average about 10 acres, new about 15. Leases getting more uncommon, and farms mostly held from year to year. Tenants bound not to exceed three crops to a fallow; but there is no restriction as to the quantity of wheat sown. Average rent of land in 1810, 11, 2s. 6½d. an acre. Little can be said in favour of the farm buildings. The old houses and offices were sometimes built of timber; sometimes the walls were of stone, and sometimes of mud or clay, or thatched; they are in general injudiciously placed, ill-planned, and inconvenient. The new farm-houses and offices are of brick, covered with tile, and are very substantial; but convenience is said not to be much studied. There are no open sheds for wintering cattle, nor feeding-sheds for soling with turnips, and other green food. (*Survey*, p. 30.) Coal is wrought to a considerable extent at various places; but Birmingham is supplied with coal brought by canal from Staffordshire. Warwick ranks high as a manufacturing co. Birmingham is the principal seat of the hardware manufacture; and nowhere, perhaps, has the combined influence of ingenuity, skill, and capital been more astonishingly displayed than in the immense variety, beauty, utility, and cheapness of the articles produced in this great workshop. Coventry has been long distinguished for its proficiency in the silk trade, particularly in the manufacture of ribands. Needles and fish-hooks are made at Alcester; hats at Atherstone; and flax-mills have been erected at Tamworth, and in other places. Principal rivers Avon, Tame, Aise, and Leam. The Birmingham and Fazeley Canal runs along the N.W. side of the co.; and it is intersected by the Warwick and Birmingham Canal, the Warwick and Napton Canal, the Oxford Canal, &c.;

the co. is also intersected by the railway from London to Birmingham, and thence to Manchester. It is divided into 4 hundreds, and 4 subsidiary districts, and contains 205 parishes. It sends 10 mems. to the H. of C.; viz. 4 for the co., and 2 each for the city of Coventry and the bors. of Birmingham and Warwick. Registered electors for the co., in 1839-40, 11,089, whereof 6,786 belong to the E., and 4,283 to the W. division. In 1841 Warwick had 81,445 inhabited houses, and 402,121 inhabitants, of whom 195,967 were males, and 206,154 females. Sum expended for the relief of the poor in 1838-39, 108,711. Total annual value of real property assessed to the poor rates, in 1841, 1,609,747.

WARWICK, a parl. and mun. bor. and par. of England, near the centre of the co. Warwick, of which it is the cap., hund. Knightlow, on the Avon, 2½ m. W. Leamington, and 82 m. N.W. London. Area of parl. bor., the limits of which were not altered by the Boundary Act, and which is co-extensive with the two parishes of St. Mary and St. Nicholas, 6,360 acres. Pop., in 1831, 9,109. It stands on an abrupt acclivity on the N. bank of the river, which is here crossed by a handsome stone bridge of a single arch; and is regularly laid out, consisting of two principal thoroughfares, each other towards the centre of the town, with a number of smaller cross streets. The principal streets are well built, paved, lighted with gas, kept remarkably clean, and ornamented with several handsome public buildings. The most conspicuous of these is St. Mary's church, which, having been nearly burnt down in 1694, was rebuilt in 1704. It exhibits a singular union of various styles: the square tower, which was designed by Sir Christopher Wren, and is finely proportioned, rises to a height of 130 ft.; it is supported on 4 pointed arches, with a thoroughfare underneath, and crowned with pinnacles. Rickman says, that "The whole of this church, except the chancel and its adjuncts, is a composition of the greatest barbarity; but the chancel is an uncommonly beautiful specimen of Perpendicular work, and the east front is remarkably fine, simple in arrangement, yet rich from the elegance of its parts and the excellent execution of its details. The interior is equally beautiful, and there are, on the N. side, a monumental chapel and vestry of very good character; but the great feature of the church is the Beauchamp Chapel erected in 1464. It is completely enriched both within and without; its details of the most elegant character and excellent execution, and in very good preservation. It consists of a chapel, of several arches, and a small aisle, or rather passages, on the N. side, between the chapel and the church. In the centre of the chapel stands a very rich altar tomb, with the effigies of Richard Beauchamp, Earl of Warwick, whose executors commenced the erection of this chapel, which, however, was not completed until the 3d Edw. IV. There are some other monuments, (including a fine one of Dudley, Earl of Leicester, favourite of Elizabeth), but others are of much later date, and rather disfigure the chapel than add to its beauty." The living of St. Mary's is a vicarage, in the gift of the corporation of Warwick, worth 300l. a year. The church of St. Nicholas is small and plain; the living, also in the gift of the corporation, is worth 218l. per annum. Other churches formerly existed, of which there are now no remains. The Independents, Friends, Wesleyans, Unitarians, and Baptists, have their respective meeting-houses.

The court-house in the High Street is a respectable stone building erected in 1730. The county hall, a spacious and handsome edifice 94 ft. in length, and 36 ft. in width, has an elegant stone front supported by a range of Corinthian pillars. In this building the courts of justice are held; and attached to it on the N. side is the co. jail, a large and well designed building, surrounded by a strong wall 23 ft. in height, enclosing near an acre of ground. The co. bridewell, in which is a corn-mill, (worked by the male prisoners), &c., and the market-house, are large and substantial modern structures. It has also a public subscription library and news-room, and a small theatre.

But the great glory of Warwick is its castle, the seat of the Earl of Warwick, and the most magnificent of the ancient feudal mansions of the English nobility, still used as a residence. It stands on a rock overhanging the Avon, a little to the S.E. of the town. It retains much of its ancient grandeur of appearance, and, uninjured by Time, presents an interesting memorial of by-gone ages. Its foundation is attributed to Ethelfleda, daughter of Alfred, in 915; but no authentic trace now remains of the original building. Caesar's tower, 147 ft. in height, supposed to have been built at least 700 years ago, is in a perfect state of preservation. Guy's Tower, 128 ft. in height, and built in 1394, is, also, nearly perfect; it appears to be of a Decorated character; and though very plain, is perhaps the most perfect remain of its kind in existence, and curious alike as to composition and construction. The principal entrance faces the E. side of the town, and the approach to it is a broad winding road cut in the solid

rock. Before the front is a disused moat, a stone arch over which has replaced the ancient drawbridge. On passing the double gateway, the visiter finds himself in the inner court of the castle, surrounded on all sides by lofty battlemented walls and ramparts. This castle was formerly a strong fortress; and by means of open flights of stone steps and passages on the tops of the walls there is a line of communication all round the building. The parts of this vast and venerable pile that are occupied by the family are magnificently fitted up, but so as to harmonise, in all respects, with the style and character of the building. The collection of paintings is at once extensive and valuable.

In a greenhouse attached to the castle is the WARWICK VASE, one of the noblest remains of ancient art. It is of white marble, and of large dimensions, being capable of holding 136 gallons. Its handles are exquisitely formed of interwoven vine branches. On the body of the vase are the heads of satyrs, bound with wreaths of ivy, the skin of the panther, with the head and claws beautifully sculptured, and other appropriate ornaments. This most splendid relic was found at the bottom of a lake, at Adrian's Villa, at Tivoli (which see), of which, no doubt, it had formed a principal ornament; and having been purchased by Sir William Hamilton, was consigned by him to his relative the Earl of Warwick, at whose expense it was brought to England, and by whose liberality it has been placed in a situation where it may at all times be seen by the public.

The remains of several monastic establishments exist in and near Warwick; and at the E. and W. extremities of the town are gates, each containing some ancient work with modern additions. Leicester's Hospital, an ancient building at the W. extremity of High Street, was originally a hall belonging to two guilds, and was converted to its present use by Robert Dudley, Earl of Leicester, for the reception of 12 poor men, chiefly disabled veterans, and for a professor of divinity and master. In 1811, the clear value of the estates with which it is endowed amounted to 2,000*l.* per annum. In 1813, the master's salary was raised from 50*l.* to 400*l.* a year, and the number of inmates increased to 22. The college school, originally founded by Henry VIII. as a free grammar-school, and endowed out of the revenues of the dissolved monasteries, is open to all the boys of the town. It has two exhibitions of 70*l.* to each of the universities. Of late years it had fallen into a state of decay; but recently the number of youths educated here has increased, and at present (1842) the school is comparatively prosperous. Here is, also, a charity-school founded and endowed for the instruction of 39 boys and 36 girls; a national school; school of industry, &c., and not less than 40 almshouses. Large funds are vested in the hands of the corporation for distribution among the poor.

The manufactures, which are unimportant, comprise a few descriptions of cotton and woollen goods, a worsted mill, with a ropery, and a brass and iron foundry. There are several large malting houses, and lime, timber, and coal-wharfs, on the banks of the Stratford canal, which comes up to the N. part of the town, and by which it communicates with Oxford, Birmingham, and the Severn. It is within about 10 m. of Coventry, and consequently, also, of the London and Birmingham railway. The *Bound. Rep.* says, "The town is thriving, and distinguished by an appearance of respectability and neatness. Trade seems to be rapidly increasing, which may be accounted for in great measure by its proximity to and connection with Leamington, where most of the Warwick tradespeople have shops, and where the chief speculators from this town invest their capital." But circumstances have changed materially in the interval. The great increase of Leamington, and its superior advantages, have taken much of the capital and business from Warwick, which it formerly enjoyed, and proportionally depressed the latter. Very few Warwick tradesmen have also shops in Leamington. Warwick is a bor. by prescription: its earliest charter dates from the 45th of Henry III., but it was not regularly incorporated till 1553. Under the Municipal Reform Act, it is divided into 2 wards, and is governed by a mayor, 5 aldermen, and 18 councillors. Quarterly courts of session are held for all offences not capital; a court-leet annually; and there is occasionally a court of record for the recovery of debts under 40*l.* The bor. has returned 2 mems. to the H. of C. since the reign of Edward I., the franchise having been vested, previously to the Reform Act, in the parson of church and poor-rates. Registered electors, in 1839-40, 977. Corporation revenue, in 1840, 1,058*l.* It has a weekly newspaper; and the Warwick and Leamington Banking Company, established in 1834, has its head office in the town. The Leamington Priory Banking Company has also a branch here.

Warwick is conjectured by Dugdale and other writers to have been a Roman station; but there are no proofs of its having existed before the Saxon times. It was in great part destroyed by fire in 1694. Market-day, Saturday. Fairs, twelve times a year; mostly for horses, cattle, and

cheese. (*Hist. of Warwick; Bound. and Munic. Corp. Rep.; Cooke's Warwick Castle; Private Inform.*)

WASHINGTON, (so called in honour of the father of the republic,) a city of the U. States, being the cap. of the Union, and the seat of the general legislature and government, in the federal distr. of Columbia, on the Potomac, here crossed by a wooden bridge, nearly 1 m. in length, at the confluence of the Anacostia, 210 m. S.W. New York; lat. 38° 32' 54" N., long. 77° 1' 48" W. Pop., in 1840, 23,364. "Every body knows," says Capt. Marryatt, "that Washington has a capitol, but the misfortune is, that the capitol wants a city. There it stands, reminding you of a general without an army, only surrounded and followed by a parcel of ragged little dirty boys; for such is the appearance of the dirty, straggling, ill-built houses which lie at the foot of it." (*Diary, &c.*, II. 1, 2.) But the staple of this statement consists, as might perhaps have been expected, of fiction rather than of truth. The plan of the city is laid down upon a magnificent scale, and though it has not increased so rapidly as was expected, it is now of very respectable dimensions. The streets cross each other at right angles; and are intersected diagonally by *avenues*, named after the states of the Union. The smaller streets are from 70 ft. to 110 ft. wide, the avenues and streets leading to public places from 120 ft. to 160 ft. wide. Mr. Stuart says, "The entrance to the city by the Pennsylvania avenue, which reaches from the capitol to the President's house, 160 ft. in width, and planted with rows of poplar trees, is magnificent. The city is placed in so fine a situation, and the capitol is so truly an imposing building, that I have seldom been more pleased than with the first view of the seat of the legislature of the U. States." (*Stuart's America*, I. 388.) The capitol, the noblest structure in the Union, stands on a hill elevated about 75 ft. above the Potomac, which it overlooks. It is built of freestone, and consists of a centre and two wings, the entire front being 350 ft. in length. In the centre of the E. side is a fine portico, supported by 18 Corinthian columns, and approached by a flight of steps: over the centre of the building is a large dome rising to 145 ft. in height: smaller flat domes, reaching to about 70 ft. high, cover the wings. In the interior, under the central dome, is the circular chamber called the Rotunda, ornamented with reliefs, and paintings of national subjects. On the W. of this apartment is the congress library, with 20,000 vols. In the S. wing is the House of Representatives, in the form of a Grecian amphitheatre, 95 ft. in diameter, and 60 ft. in height, surrounded with 24 Corinthian columns of variegated native marble. "The seats for the members are conveniently disposed: each member has his fixed place, a chair, and a small desk. The members, when speaking, generally stand in the space between the desk, which affords sufficient room." (*Stuart*, I. 389.) The senate chamber, in the N. wing, is of the same form, but smaller, being 70 ft. in diameter, and 42 ft. in height. Over the president's chair is a portrait of Washington; and statues of Liberty and History ornament this hall. Underneath is the hall of the supreme court of the U. States; and there are, in the building, 70 rooms for the accommodation of committees, &c. The capitol is surrounded by ornamental grounds, comprising about 22 acres. This magnificent building is said to have cost, in all, the sum of 2,596,500 dollars. Opposite the N. front of the building is a column, erected in honour of the officers who fell at Tripoli. The President's house, of freestone, two stories high, with an Ionic portico, is a handsome building. Beside it are four large edifices for the chief departments of government. In the city are the U. States general post-office with the patent-office, the arsenal, and navy-yard, a city hall, 250 ft. in length by 50 ft. in breadth, hospital, penitentiary, upwards of 20 churches, 4 market-houses, the Columbian institute, a Rom. Cath. seminary, a city library; with medical, botanical, masonic, and many benevolent societies and other institutions. Washington has a large glass manufactory, but its trade is mostly confined to the supply of goods to the government establishments and members of Congress, Alexandria, lower down the river, being more conveniently situated for carrying on foreign trade, of which it has a considerable share. Exclusive of several large taverns, the city recently had 4 banks, an insurance company, and 10 printing-offices, from which 2 daily and several weekly newspapers are issued. Its suburb, George Town, to the W. of the city, from which it is separated by a narrow creek across which are numerous bridges, had, in 1840, a pop. of 7,312; most of its houses are of brick, and it is a thriving town with a considerable trade. The Ohio and Chesapeake canal terminates in George Town, and the city is united to Annapolis by a railway. Mount Vernon, the seat of Washington, the founder and father of the republic, on a bank above the Potomac, is situated about 15 m. from the capitol. It continues much in the state in which it was left by its illustrious owner. The remains of Washington, who died on the 11th of December, 1800, are deposited in a vault in the grounds.

Washington was made the seat of the U. S. States government in 1800; it sustained a good deal of injury from the British in 1814, more, perhaps, to the discredit of the latter, than to the loss of the Americans; but not a trace is now visible of these injuries. (*Encyc. Amer. and Amer. Almanac, 1842; Encyc. of Geog., American ed.; Swan's Democrat's Gazetteer, &c.*)

WATERFORD, a marit. co. of Ireland, prov. Munster, having S., St. George's Channel; E. Waterford Harbour, by which it is separated from Wexford and Kilkenny; N., Tipperary; and W., Cork. Area 471,281 acres, of which 118,034 are unimproved mountain, with but little bog. Though generally coarse, there is a considerable extent of fine land in this co., particularly in its S.E. quarter, and the mountains afford good pasturage for cattle. Estates, for the most part, very large; the largest, which belongs to the Duke of Devonshire, is managed on the most liberal principles, and greatly improved. Here, indeed, and generally throughout Ireland (and, we believe, that the same thing may be truly affirmed of England), tenants and occupiers on large estates are decidedly better off than those on the smaller class of properties. This is the principal dairy co. of Ireland. When it was visited by Mr. Young, not 1-30th part was under the plough. (*Tour in Ireland, 4to ed. p. 329.*) The proportion in tillage is now, however, much larger. This has principally arisen from the vicious custom of dividing farms. "In this co.," says Mr. Wakefield, "when the eldest daughter of a farmer marries, the father, instead of giving her a portion, divides his farm between himself and his son-in-law; the next daughter gets a half of the remainder; and this division and subdivision is continued as long as there are daughters to be disposed of. The sons are left to shift for themselves the best way they can." (l. 280.) Some of the dairy farmers are in easy circumstances; but the condition of the tillage farmers and cottiers is much the same as in other parts of Munster. Some very material improvements have, however, been introduced since 1820, into this and the contiguous cos. Improved swing-ploughs, made of iron, drawn by two horses driven by the ploughman, are now become very general. Land is kept cleaner; there has been a very great increase in the quantity of lime used as manure; green crops are more attended to; and the quantity of wheat raised within these few years has been more than doubled; while there has been a decided falling off in the production of oats. There has also been a large increase of the exports of butter and bacon. Average rent of land, 12s. 6d. an acre. The minerals, which comprise copper, iron, &c. are but little wrought, and are unimportant; which, also, is the case with manufactures: a considerable cotton manufacture has, however, been established at Portlaw, and some glass is made in Waterford. Principal rivers, Blackwater, Suir, and Bride. Waterford is divided into 7 baronies, and 74 parishes; and returns 5 mems. to the H. of C.; being 2 for the co., 2 for the bor. of Waterford, and 1 for Dungan. Registered electors for the co., in 1839-40, 1,675. In 1831, Waterford had 24,848 inhab. houses, 30,191 families, and 177,054 inhabs.; of whom 85,217 were males, and 91,837 females.

WATERFORD, a city, parl. bor., and sea-port of Ireland, prov. Munster, on the estuary of the river Suir, about 10 m. from the sea, and 82 m. S.S.W. Dublin, lat. 52° 13' N., long. 7° 10' W. It is a co. of itself, comprising 9,683 acres, but is locally situated near the W. extremity of the co. of Waterford, of which it is the cap.

In 1831, the pop. of the co. of the city amounted to 26,521, and that of the city itself to 26,377. The Boundary Act made no change in the limits of the parl. bor., which embrace the whole co. of the city. The city is situated on the S., or S.W. side of the river; but a considerable portion of the co. of the city is situated on its opposite side, the communication between them being maintained by a fine wooden bridge 332 ft. in length by 40 ft. in width, constructed by an American artist. The quay fronting the river, about 1 m. in length, is one of the finest in Europe, and is bounded on the land side by a range of well built houses. The other principal streets are the Mall, Beresford Street, Broad Street, &c.; but the city is very irregularly laid out; and in the older parts the streets are mostly narrow and dirty, with mean thatched houses, or rather hovels, occupied by a very poor and wretched population. In the more modern parts, however, the streets are comparatively broad, and the houses well built and substantial. The co. of the city is divided into 12 parishes, of which 3 are entirely rural. The cathedral of the see of Waterford (now merged in that of Cashel), is a fine modern building, with an ornamented spire; near it is the bishop's palace, also, a handsome modern structure. Here are 3 parish churches, and 4 Rom. Catholic chapels, the largest of which is the cathedral. The Presbyterians, Baptists, Methodists, Independents, and Quakers have, also, their respective places of worship. Among the public buildings, exclusive of the churches, may be noticed the Town Hall, Chamber of Commerce, County and City

Prisons and Court Houses, Artillery Barracks, Penitentiary, Custom House, St. Reginald's tower, on the quay, an ancient fortress, now a police barrack, &c.

The educational establishments comprise an endowed classical school, under the patronage of the corporation, which provides a residence and salary for the head master; the College of St. John, a plain but spacious building, provides instruction for candidates for the Rom. Catholic ministry, preparatory to their entrance into the College of Maynooth; and there are various other public and private schools. Mr. Inglis states that he visited a Catholic school, at which upwards of 700 children were educated by an association of young men, called the "Brothers of the Christian Schools." Here, also, is the Waterford Institution for the Diffusion of Knowledge, with a library and a small museum, a Literary and Scientific Society in which lectures are delivered, and Agricultural and Horticultural Societies. In 1841 it had no fewer than 5 weekly newspapers.

The charitable institutions comprise a Blue-coat School for Protestant boys, founded about 1700, and possessing an estate of 1,400 acres; a Blue-coat Hospital for Protestants, founded in 1740; Widows' Apartments, erected in 1792, for the maintenance of 10 poor clergymen's widows; the Leper Hospital, founded by King John, and now used as an infirmary, is capable of accommodating 400 patients; the Holy Ghost Hospital, founded in 1240, and now appropriated to the reception of females; the Fever Hospital, the first of the kind in Ireland, opened in 1799, and capable of receiving 150 patients; the Lunatic Asylum for the co. and city, a large modern building, has accommodation for 100 patients; the House of Industry, opened in 1779, for the relief of the poor, and the punishment of vagrants and sturdy beggars; a mendicity institution, with similar objects, was opened in 1820. There is also a lying-in hospital, a charitable loan fund, and several orphan societies.

The manufactures of Waterford are unimportant, comprising only a glass work and several breweries. It is, however, better situated for trade than any other town of Ireland. The harbour is excellent, vessels of 600 tons burden coming up to the quay. The Suir, which is navigable for barges as far as Clonmell, gives it a considerable command of inland navigation, and it is also the principal entrepot for the produce brought down by the Barrow and its important tributary the Nore, as well as for the produce which is to be conveyed inland by these channels; its trade is in consequence great, and rapidly increasing. Its exports of raw produce, including corn and flour, butter, beef, pork, and bacon, hides, tallow, &c., exceed those from any other Irish port, and amount, at present, to above 2,000,000*l.* a year. The opening of a steam communication between Waterford and Bristol, and other towns, has been of peculiar advantage to the first.

Subjoined is a statement of the quantity and value of the principal articles exported from Waterford during the year ending the 30th April, 1835:—

Principal Articles.	Quantity.	Value.
Beef	do. tierces	33 at 130 <i>l.</i>
Pork	do. tierces	672 - 90 <i>l.</i>
Pork	do. barrels	8,219 - 26 <i>l.</i>
Bacon	do. flitches	399,138 - 26 <i>l.</i>
Butter	do. cwt.	118,471 - 80 <i>l.</i>
Lard	do.	18,397 - 30 <i>l.</i>
Wheat	do. barrels	65,775 - 12 <i>l.</i>
Oats	do.	24,316 - 12 <i>l.</i>
Barley	do.	57,731 - 14 <i>l.</i>
Flour	do. cwt.	496,838 - 16 <i>l.</i>
Oatmeal	do.	11,381 - 12 <i>l.</i>
Bread	do.	1,391 - 12 <i>l.</i>
Cattle	do. head	4,410 - 140 <i>l.</i>
Live Sheep	do.	1,838 - 45 <i>l.</i>
Do. Pigs	do.	58,513 - 35 <i>l.</i>
Total		1,818,535 12 6

There belonged to the port, in 1841, 115 vessels of the aggregate burden of 19,309 tons; and the gross customs duty received at the port in 1840, amounted to 196,88*l.* The management of the port is vested in 24 harbour commissioners, nominated partly by the Chamber of Commerce, incorporated in 1815, and partly by the corporation. Post-office revenue, in 1830, 4,727*l.*; in 1836, 8,864*l.* Branches of the Bank of Ireland, the Provincial Bank, and the Agricultural Bank, have been opened in the town.

Being the place at which Henry II. landed, in 1172, to take possession of his conquest in Ireland, Waterford was early distinguished by marks of royal favour. It received its first charter from King John, and had no fewer than 12 additional charters from succeeding monarchs. It appears, however, that the right to send 2 representatives to the Irish H. of C. was not conferred by charter, but rested only on prescription, the practice having commenced in 1574. At the Union, Waterford was authorised to send 1 mem. to the Imperial H. of C., and under the Reform Act she sends 2 mems. Registered

electors, in 1839-40, 1863. The limits of the municipal bor. are much less extensive than those of the par. bor. Under the act 3 & 4 Victoria, cap. 108., the city is divided into 5 wards, and is governed by a mayor, 5 other aldermen, and 30 councillors. It has a court of record, which decides pleas to any amount; a civil bill court for debts from 2*l.* to 10*l.*; and a mayor's court, for the decision of claims as to wages. Assizes for the co. and city are held here twice a year, and general sessions of the peace 15 times.

It is rather singular, that notwithstanding the increase of its trade, there is a great deal of abject poverty and misery in Watford. Some improvements have, however, taken place, both in respect of cleanliness and of the dress of the lower orders. When Mr. Inglis was here, whiskey drinking prevailed to a frightful extent; but, thanks to the exertions of Father Mathew, this has been materially diminished. (*Parl. Reports and Private Information.*)

**WATERLOO**, a hamlet of Belgium, prov. Brabant, on the verge of the forest of Soignes, and on the road from Brussels to Charleroi, 9 m. S. by E. the former. This village will be for ever memorable in military history for the great battle fought in its vicinity on the 18th of June, 1815, between the allied army under the Duke of Wellington, and the French, under Napoleon. There is some discrepancy in the statements on the subject, but each army probably consisted of about 70,000 men. The French began the attack between 11 and 12 o'clock forenoon. The object of Napoleon was to defeat the British, or force them to retreat, before the Prussians, who he knew were coming up, could arrive on the field; while that of the Duke of Wellington was to maintain his ground till he could be joined by his allies, when it might be in his power to become the assailant. The attacks of the French were repeated with the greatest fury; but they made no serious impression on the British, by whom they were sustained and repelled with invincible courage and resolution. At length, about 3 past 6 o'clock, the Prussians came into the field, with a strong force of from 15,000 to 20,000 men. The English then became the assailants; and though Napoleon brought forward his guard, which had not previously been engaged, it could not stem the torrent, and, having been forced to give way, the whole army got into inextricable confusion, and the rout became universal. The slaughter was enormous. The British lost, besides officers, about 15,000 men killed and wounded. The French loss is not exactly known; but it was not, perhaps, less, in the battle and pursuit, than 30,000 men. All their cannon and baggage also fell into the hands of the conquerors; and it may, indeed, be said that the French army was entirely destroyed.

Such was the battle of Waterloo, in which the star of Napoleon set never to shine again! It is not, however, to be denied that he did all that was possible in the desperate circumstances under which he was placed. He had already defeated and beat back the Prussians; and his only chance of being able to make head against the forces that were marching against him, of awakening the enthusiasm of the French, and paralysing his enemies, depended on his being able to defeat the army under the Duke of Wellington before it could form a junction with the Prussians. The skill of the British general, and the invincible courage and resolution of his troops, defeated this project; but it was worthy the genius of Napoleon, whose efforts in this "death struggle" were well seconded by his troops, who, though unsuccessful, did all that brave men could do.

**WATFORD**, a market town and par. of England, co. Herts, hund. Cashio; on the Colne, here crossed by a bridge, 10 m. N.W. London. Area of par., including beside Watford 4 adjacent hamlets, 10,580 acres. Pop. of do., in 1831, 5,293; and of the town 2,960. The latter, which is well built, consists principally of a main street, about 1 m. in length, on the high road from London to Birmingham. The church, in the centre of the town, is a large edifice, consisting of a nave, 3 aisles, and a chancel: it has, at the W. end, a massive embattled tower, 80 ft. in height, surmounted by a small spire rising about 20 ft. higher. It has some fine monuments, especially 2 by Nicholas Stone. The living, a valuable vicarage, worth 730*l.* a year, is in the gift of the Earl of Essex. Here, also, are chapels for Baptists and Wesleyans. The educational establishments comprise a free school, founded in 1704, for 40 boys and 14 girls, with an income of about 180*l.* a year, which, in 1832, afforded instruction to 60 scholars; another free school, with a small endowment, established in 1641; a national school supported by subscription, &c.: the funds for the general charities yielded, at the date of last inquiry, an income of nearly 850*l.* a year. Next to agriculture, the chief branches of industry pursued here are the spinning and winding of silk, straw plaiting, and malting. In 1838, there were 2 silk mills at work in the par., which furnished employment for 220 hands. There are some very extensive paper mills on the Colne, in the vicinity;

and Watford is a considerable market for corn, sheep, cattle, and hogs. Its trade in these is facilitated by the Grand Junction Canal, which passes about 2 m. W. of the town, where it is joined by the Colne, which has been rendered navigable to St. Alban's. The London and Birmingham Railway has a station immediately to the E. of Watford, near which the line passes through a tunnel 1,330 yards in length. A council of magistrates, and a court of request for the recovery of small debts, are held in the town weekly. Markets on Tuesdays; and fairs four times a year for cattle, horses, pedlery, and the hiring of servants. Adjoining Watford on the W. is Cashiobury Park, the seat of the Earl of Essex, lord of the manor. The house has a good deal of the appearance of a monastery; it has some good pictures, and a valuable collection of books. (*Private Information.*)

**WEARMOUTH.** See SUNDERLAND.

**WEDNESBURY**, a market-town and par. of England, co. Stafford, hund. Offlow, near the source of the Tame, in the great coal and iron district of which Birmingham is the centre, 7 m. N.W. Birmingham. Area of par., 2,190 acres. Pop. of do., in 1831, 8,437. The church, which stands on a hill, and is supposed to occupy the site of an ancient castle, repaired within these few years, is a fine structure, with a tower surmounted by a lofty spire. It has an octagonal E. end, and other portions in the perpendicular style, and within are some exquisitely carved prebendal stalls, and a curious moveable reading-desk. (*Rickman.*) The living, a vicarage worth 300*l.* a year, is in the gift of the crown. Here are chapels for Independents and Wesleyans; a Lancastrian school, supported by subscription; a small endowed school for poor children, an almshouse, and some minor charities. The inhabs. are mostly employed in various branches of the hardware manufacture, especially in the production of the numerous articles included under the term saddlers' ironmongery, with nails, hinges, edge-tools, and cast-iron works of almost every description. Enamel painting is also extensively carried on; and it has a soap manufactory, which produced, in 1839, 2,971,221 lbs. hard soap. A valuable potter's earth is obtained in the vicinity; in which are, also, several corn mills. A branch of the Birmingham Canal approaches within a short distance of the town on the one hand, and the Grand Junction Railway on the other. The local authority is vested in a constable chosen at the manorial court, held here annually; a court of requests is opened occasionally, for the recovery of debts under 5*l.* Market-day, Wednesday; fairs, twice a year, for cattle and pedlery.

**WEIMAR-EISENACH (GRAND DUCHY OF SAXE)**, a state of Central Germany, the most important of the minor Saxon states, consisting of several detached portions of territory, inclosed on different sides by the dominions of Prussia, Hesse-Cassel, Bavaria, the kingdom of Saxony, the duchies of Coburg, Meiningen, &c., the cap. being in lat. 50° 59' 12" N. long. 11° 21' E. Total area estimated at 1,416 sq. m. Pop., in 1839, 247,603, all Protestants, except about 10,300 R. Caths., and 1,400 Jews. The principality of Saxe-Weimar is subdivided into the circles of Weimar-Jena, and Neustadt; that of Eisenach in the W. forms a circle of itself. The greater part of the country belongs to what is called the *Thüringerwald*, or Thuringian forest, and to the basins of the Elbe and Weiser; its principal rivers being the Ilm, Saale, White Elster, and Unstrut. Agriculture is the principal occupation of the inhabs.; the soil, consisting of a clayey loam upon a calcareous basis, is moderately fertile. Owing to the minute subdivision of the land the occupiers are for the most part poor. Mr. Jacob says that they live harder than day labourers, and that, despite their industry and economy, they are unable to increase their resources. (*View of Germany*, 328.) The country had not then, however, fully recovered from the devastation produced by the late war, and it is now a good deal improved. In the vicinity near Weimar the soil is a rich black mould, producing, notwithstanding its defective culture, very superior crops. The villages in this part of the duchy are thickly placed and populous, but, in consequence of the smallness of the farms, there is a great scarcity of cattle. Of late years, however, the rearing of cattle has been a good deal more attended to; and the stock of sheep has been greatly increased in consequence of the ready and advantageous market for wool afforded in England. Game is extremely plentiful; and the woods comprise about one million Prussian *morgens* of land. Most of the peasants' houses are built of timber.

Coal and salt are both raised, the former in no great quantities, but the production of the latter, at Kreisitzburg, may amount to 1,100,000 lbs. a year. Iron and manganese are the chief metallic products. Manufactures are not very important: woollen cloths, carpets, hosiery, linen stuffs, iron, hardware, and tobacco-pipes, are the principal products. There are a good many breweries and distilleries. Manufacturing industry is most active in the circle of Eisenach.

The government is a limited monarchy; and the royal

family of Weimar took the lead in Germany after the peace, in introducing a free representative system into their dom. The constitution dates from 5th May, 1816, and is certainly one of the most liberal in Germany. "The miniature parliament forms only one house, for it consists of only 31 mems.; 10 are chosen by the proprietors of estates-noble, 10 by the citizens of the towns, 10 by the peasantry, and 1 by the university of Jena. The last is elected by the *Senatus Academicus*; and, besides being a professor, must have taken a regular degree in the juridical faculty. At the general election, which occurs every 7th year, not only the representatives themselves are chosen, but likewise a substitute for every member, that the representation may be always full. The 10 mems. for the nobility are chosen directly by all the possessors of patents of nobility, or estates-noble. Even ladies in possession of such estates have a vote; but if unmarried, they must vote by proxy.

"In the representation of the towns and peasantry, the election is indirect. The towns are distributed into 10 districts, each of which sends 1 mem. In these, every resident citizen has a vote, without distinction of religion; even Jews possess the franchise, though they cannot be elected. The whole body of voters in a town choose a certain number of delegates, in the proportion of 1 for every 50 houses the town contains, and these delegates elect the mem. for the district. The mem. for a district of towns must have a certain independent income of about 75*l.* sterling, if he be elected for Weimar or Eisenach, and 45*l.* if chosen to represent the towns of any other district. The election of the 10 representatives of the peasantry proceeds in a similar way. Their representatives must belong to themselves; they are not allowed to take them from the higher classes of landed proprietors, which they certainly would have been easily brought to do, had it not been expressly prohibited. Neither brothers, nor father and son, are capable of sitting in the chamber at the same time. The parliament elects its own president, whose election is confirmed by the grand duke, and who holds office during two parliaments. Regularly the chamber meets only once in three years, and the budget is voted for the whole of that period; but a standing committee of nine mems. continues during the adjournment. During the session the mems. have an allowance of about 10*l.* a day, besides a certain sum per mile for travelling expenses. The powers of the chamber extend to all the branches of legislation, and its consent is indispensable to the validity of all legislative measures. The majority of voices determines every question. The mems. have full privilege of parliament; their persons are inviolable from the commencement till eight days after the close of the session: they are secured in liberty of speech, and legal proceedings cannot be instituted against them without the consent of the chamber." (*Russell*, i. 111-117.)

The ministry is in three departments, those of justice, finance, and public instruction. There are courts of primary jurisdiction in the principal towns, and courts of appeal in Weimar and Eisenach, in which, with Weida and Dornbach, are also criminal courts; all having appeal to the supreme court of Jena, which is also the supreme tribunal for the States of Saxe-Coburg, Meiningen, and Reuss. According to Berghaus, public education is no where in Germany so widely diffused, and so well attended to, as in Saxe-Weimar. In 1830, 35,285 children were receiving public instruction. According to the budget for 1839-41, the revenue of the Grand Duchy amounts to 773,093 *thalers*, and the expenditure to 664,748 *do.*; the public debt amounts to 3,500,000 *thalers*. The contingent to the army of the Confederation consists of 2,100 men, all persons being liable to service from their 20th to 25th year. Saxe-Weimar holds the 15th place in the Confed.; having one vote in the full Diet, and with Saxe-Coburg, Meiningen and Altenburg, one in the Committee.

WEIMAR, a city of Central Germany, cap. of the above Grand Duchy, and the usual residence of the Grand Duke on the Ilm, an affluent of the Saale, 104 m. W. by S. Dresden, 116 m. S.E. Hanover, and 136 m. S.W. Berlin. Pop. in 1838, 11,212. The city, which is partially surrounded with walls, though irregularly laid out, has several good and clean streets, and handsome houses; and deserves to rank with German towns of the second order. The Ilm, which flows along its E. side, is crossed by 3 bridges; it traverses the centre of the ducal park, the chief promenade of the inhabs.; and has on or near its W. bank, the ducal palace and mews, the riding-house, *rotte schloss* or red castle, public library, and several other public buildings. The ducal residence is a good building, and is tastefully furnished; but comfort rather than magnificence was the object of the late Grand Duke, by whom it was built. The town church has a large organ; an altar-piece of the Crucifixion, by Luke Cranach, in which are introduced portraits of his friends Luther and Melancthon, and of himself; and monuments to Herder, and numerous members of the

ducal family interred here. In the park is a handsome temple containing some beautiful arabesques, and a portrait by Angelica Kauffman. An avenue from this promenade conducts to the Belvidere, a summer palace of the Grand Duke, about 2 m. distant.

If Dresden be the Florence, Weimar was once fairly entitled to be called the Athens of Germany; having been the residence of Wieland, Schiller, Goethe, Herder, &c., and invited thither by the late Grand Duke. Goethe and Schiller are buried in the new cemetery, one on each side their patron. During their superintendence, the theatre at Weimar was among the most celebrated in Germany; and its opera is still very well conducted and supported, the inhabs. of the city being great lovers of music. The grand ducal library holds a high rank, and has 96,000 printed vols., besides MSS. (*Statist. Journ.*, 1841.) It is open to the public, who are even allowed the use of the books at their own houses. In this library are some fine busts, and some paintings by A. Durer. One of the principal objects of notice in Weimar is the *Landes-Industrie-Comptoir*, a vast printing and publishing establishment, in which a great number of persons are employed in translating such foreign works as are likely to be read in Germany; "and such is the rapidity with which this office is performed, that frequently the translation of a book published in London at the beginning of one month is in full circulation by the end of the same month throughout Saxony, and the independent states of Germany, from the press of the *Industrie-Comptoir*." (*Granville's Trav.*, i. 222.) From this press issues the *Wurmian Almanac*, frequently quoted in this work. Weimar is the seat of nearly all the superior educational institutions of the grand duchy. It has a famous academy attended by young English gentlemen, several hospitals, an orphan asylum, central prison, &c. The manufactures of Weimar are inconsiderable: a few woollen and linen cloths, iron-ware, paper, and beer are the principal products. The town has some trade in corn and wool. Weimar was the birth-place of Kotzebue. (*Berghaus, Alg. Länder*, &c., iv.; *Stein's Handb.*; *Russell, Jacob, and Granville's Trav.*, &c.)

WELLINGBOROUGH, a market town and par. of England, co. Northampton, hund. Hamfordshoe, on the slope of a hill, 10 m. E.N.E. Northampton. Area of par. 4,490 acres. Pop. of do., in 1831, 4,688. The town, which was a place of some consequence in the time of the Saxons, consists principally of four streets, meeting in a market-place. The houses are built of red sandstone, and the town having been almost wholly destroyed by a tremendous fire in 1738, has now a comparatively modern appearance. The church, a large edifice, with a tower and spire, is, like most churches in this co., of a mixed style. It is, however, richly decorated with carved work; in its E. window is some stained glass, and on each side of the chancel are three stalls like those in cathedral choirs. The living, a vicarage worth 400*l.* a year, is in the gift of — Vivian, Esq. Here, also, are places of worship for Baptists, Friends, Wesleyans, &c. The free school, founded by Edward VI., has an income of 112*l.* a year, and is open to all boys belonging to the parish. The number varies from 12 to 20, who are taught Latin gratis, but who pay 1*l.* is a quarter for English, writing, and arithmetic. The governors are the trustees of the town estate; the right of appointing the master and usher is vested in the inhabs. paying taxes. (*Digest of Charity Reps.*) The town estate, yielding an income of 350*l.* a year, partly supports the free school; and the usher's salary, with a charity school for the primary instruction of 50 children, is partly dependent on Fisher's endowment of 137*l.* 10*s.* a year. There are several charities for supplying bread to the poor, &c. The manufacture of boots and shoes was carried on very extensively in this town during the war, and, though fallen off, still continues to be its staple business. The corn market, on Wednesdays, is considerable.

Wellingtonborough derived its name from the wells or mineral springs around it, which were long enjoyed such celebrity, that, in 1626, Charles I. and his queen resided here in tent, for a considerable period that they might drink the waters pure from their source. The co. magistrates hold petty sessions for the div. weekly in the townhall. Fairs, Easter and Whit Wednesday, and Oct. 29. for live stock and cheese.

WELLINGTON, a market-town and par. of England, co. Salop, head of a div. of Bradford hundred, on the ancient Watling Street, 10 m. E. Shrewsbury. Area of par., which, besides the town, includes 6 townships, 7,950 acres. Pop. of do., in 1831, 9,671. The town consists mostly of narrow streets; but, of late years, these have been lighted with gas, and otherwise much improved, and are mostly lined with well built houses. The par. church is a handsome structure of freestone, with cast-iron pillars the window frames being also of iron. The living, a vicarage conjoint with the rectory of Epton, worth 842*l.* a year, is in the gift of — Eytton, Esq. (*Ecc. Rev. Rep.*) Here are several dissenting places of worship, free and national schools, and some almshouses.

houses and several minor charities. Near the town are some chalybeate and sulphureous springs, frequented by visitors. Most of the inhabs. of the par. are employed in working coal and iron mines, and limestone quarries; and there are in the par. many melting furnaces, wrought by machinery, with nail-works, glass-works, &c. Malting and some trade in timber are also carried on. The town is governed by a mayor and 2 constables, appointed annually at a mayoral court, who hold petty sessions weekly, and a court of record for debts under 20*l*. at specified times. Market-day, *Thursday*. Fairs four times yearly, for cattle and stock.

WELLINGTON, a market town and par. of England, co. Somerset, hund. Kingsbury West, on the high road from Bath to Exeter, 46 m. S.W. the former. Area of par. 4,830 acres. Pop. of do. in 1831, 4,762. The town is regularly laid out, and has been mostly rebuilt during last century: it principally consists of two spacious thoroughfares, crossing each other at right angles, the main street being about  $\frac{1}{2}$  m. in length. The church at the N. entrance is a handsome structure of mixed architecture, 110 feet in length, and 50 feet in breadth, comprising a nave, chancel, two aisles, and two small chapels. At its W. end is a fine embattled tower, 100 ft. in height, crowned with a turret and pinnacles. Within are several monuments, including a magnificent tomb in honour of Sir John Popham, chief justice of England in the reign of Elizabeth and a great benefactor of the town, and a new altar-piece ranking among the finest in the W. of England. The living, a very valuable vicarage worth 894*l*. a year, is in the gift of W. P. Thomas, Esq. A very elegant chapel-of-ease, of Grecian architecture, has been erected at the S. extremity of the town by the Rev. N. P. Thomas; and there are chapels for Baptists, Independents, Wesleyans, and Friends, the latter being here a very numerous sect. Several schools are attached to the various meeting-houses, and there are endowed almshouses for both sexes, founded by Sir John Popham, with some minor charities. A new market-house, over which is the town-hall, was erected in the centre of the town in 1832.

Wellington had formerly a flourishing manufacture of woollen goods, but it is now much fallen off. It still, however, produces druggets and serges, and has a small manufacture of earthenware. In 1838 there were in the par. three woollen mills at work, furnishing employment to 298 hands. The corn market on Thursday is large and well attended. The Bath and Exeter railway will, when completed, pass close to the E. of the town. Wellington is governed by a bailiff and subordinate officers chosen at the annual manorial court.

This town enjoys the distinction of having successively conferred on Arthur Wellesley (3d surviving son of the 2d Earl of Mornington), the greatest of English generals, the titles of Viscount, Earl, Marquis, and Duke. An obelisk upwards of 120 feet in height has also been erected, in honour of the illustrious duke, on a lofty hill about 3 m. S.E. from the town. (*Beauties of England and Wales, art. Somerset; Priv. Inf.*)

WELLS, a city, and a par. and mun. bor. of England, co. Somerset, hund. Wells Forum, at the S. foot of the Mendip Hills, 17 m. S.W. Bath. It is situated in the centre of the large par. of St. Cuthbert, which contains numerous hamlets, and has an area of about 14,000 acres, with, in 1831, a pop. of 6,649. The par. and mun. bor., which are now co-extensive, do not, however, include the whole par. of St. Cuthbert, but comprise only the old city, the liberty of St. Andrew, and some additional portions, having, in 1831, a pop. of 4,603. The city consists mostly of four principal streets, named from the four vorderies into which it is divided. They are well paved and lighted, and have many good houses. The market-place, an extensive area, communicating by an ancient gateway with the cathedral-close, has in it the town-hall and a handsome public conduit, by which the city is well supplied with water. The great objects of interest in Wells are its fine ecclesiastical edifices. The cathedral, at the E. extremity of the city, is not only one of the most perfect in its original plan, but is more complete as respects its appendages than any other in the kingdom. It was principally designed in the early part of the reign of Henry III. It is built in the form of a cross, from the intersection of which rises a large quadrangular tower 178 ft. in height. The W. front, 150 ft. in breadth, is flanked by two smaller towers, each 130 ft. in height: the total length of the church, from E. to W., is about 880 ft.; its breadth, 131 ft. "The situation of this edifice and the adjoining palace is beautiful; and though no whole side, except the W. front, is visible in any one view, the cathedral is well displayed from several points, particularly the north-west. As at Peterborough, the palace and several other buildings adjoin the cathedral, and add much to its general appearance. The character of a large portion of the building is early English, with portions of the two later styles, which are very beautifully accommodated in their forms to the older parts. The nave and transepts, and part of the towers,

are early English; the W. front is remarkably rich in niches and statues, and not less so in shafts and other small ornaments appropriate to the style. The lower parts of the sides of the western towers are similarly enriched, but the whole of the remaining exterior of the building is rather plain than otherwise; the upper parts of all the towers are much later than the lower, and much accommodated to the earlier portions as to lines and forms. The eastern part of the cross and the chapter-house are of decorated character, and remarkably elegant. The cloisters are perpendicular: the nave and transepts, and a north porch out of the nave, present an early English arrangement very remarkable for simplicity and elegance. There are various excellent portions of stone screen-work, chapels, and monuments, and some stained glass, the effect of which is peculiarly good. This cathedral is very rich in details of the best as well as the most singular kinds, and, in point of composition, some of its best parts yield to no edifice in the kingdom. The bishop's palace, though it has been altered, and, in some parts, much modernised, contains some fine portions, an early decorated chapel, and some parts of earlier date. Taken all together, the palace is one of the most valuable remains in the kingdom. The gates and other buildings in the precincts of the cathedral deserve careful examination." (*Rickman.*) Wells was first erected into a bishop's see in 905. In the 12th century it was united to the abbey-church at Bath; but the writ of *congé d'élire* for the election of the bishop is still addressed to the dean and chapter of Wells. The chapter consists of a dean and 6 other canons, 4 priest-vicars, and 42 prebendaries. Wolsey and Laud were bishops of this see. St. Cuthbert's church is a handsome perpendicular edifice; but its principal feature is its tower, one of the finest of the kind. The living, a vicarage in the gift of the dean and chapter of Wells, is worth 564*l*. a year. There are, also, places of worship for Independents, Baptists, and Wesleyans. Here is a collegiate school, under the patronage of the dean and chapter, and a united charity-school, founded in 1641, which affords instruction, clothing, &c. to 34 boys and 30 girls, and has an income of 514*l*. a year. Under the town-hall is an hospital, founded and endowed in the 15th century, for aged men and women, which has now an income of above 350*l*. a year, and 30 inmates. There are numerous other charities, including several well-endowed almshouses. Several manufactures that were formerly carried on in the town have either ceased altogether or have greatly declined; and that of silk has been wholly given up. It is said in the *Parl. Bound. Report*, that "no trade or manufactures are carried on in the town. It probably has been for a great number of years in the same state as it is now. There is no reason to believe that it will increase. Much of the property of the city belongs to the ecclesiastical or the city corporations, which cannot grant long leases, and give no encouragement to building." The corn-market, which used to be very considerable, has materially declined; but the market for cheese is still one of the most considerable in the W. of England. The trade of the place is mostly, however, confined to the retail supply of the inhabs. The West of England and South Wales District Bank has an office in the city. The earliest charter of Wells dates from the 3d of John; but the governing charter, previously to the Mun. Reform Act, was granted by Elizabeth. By the last-mentioned statute, the town is governed by a mayor, 3 other aldermen, and 12 councillors. A court of quarter sessions, the jurisdiction of which is confined to cases of misdemeanour, is held 4 times a year; but it is merely a matter of form, all trials being referred to the co. assize-court, and the court of record has also fallen into disuse. The co. assizes are held alternately here and at Taunton. Corp. rev. in 1840, 898*l*. Wells has returned 2 mems. to the H. of C. since the reign of Edward I.; the right of voting, down to the Reform Act, having been vested in the mayor, masters, burgesses, and persons admitted to the freedom of the city, which was obtainable by birth, marriage, or apprenticeship. Registered electors, in 1839-40, 414. It is also a polling-place for the E. division of the co. Markets, Wednesday and Saturday; and every fourth Saturday a large market for corn, cattle, and cheese. Fairs five times a year, mostly for cattle, horses, and pedlery. (*Parl. and Mun. Bound. Reps.; Mun. Corp. Append.*)

WELLS, a sea-port town and par. of England, co. Norfolk, hund. N. Greenhoe, on a small creek about 11 m. from the sea, 28 m. N.W. Norwich. Area of par., 2,280 acres. Pop. of do., in 1831, 3,624. The town consists principally of two streets, only partially paved. The par. church, a spacious edifice built mostly of flint, with a lofty embattled tower, has some curious sculpture and paintings. The living, a valuable rectory, being worth 785*l*. a year, is in the gift of — Hopper, Esq. Here are several dissenting chapels: a free school for 60 poor children, supported by a part of Ripgar's endowment in 1678 of 120*l*. a year, and other endowed charities to the amount of 66*l*. a year for the general relief of the poor. (*New*

*Digest of Charity Reps.*) It has a neat theatre, a subscription library, &c. The harbour of Wells is indifferent, and apt to be choked up with shifting sands; but it has been considerably improved of late years, through the exertions of the harbour commissioners.

The principal trade consists in the shipment of corn and malt, and in the import of coals, timber, &c. There belonged to the port, in 1841, 38 vessels of less than 50 tons burden, and 37 of more than that amount, the aggregate burden of the latter being 2,213 tons. Gross customs duty received at the port in 1840, only 596*l*. The oyster-fishing gives employment to a considerable number of persons. Petty sessions for the hund. are held once a fortnight, and courts leet and baron once a year. Fair, Shrove Tuesday. The races formerly held at Wells are now discontinued. (*Parl. Rep.*, &c.)

About 3 m. W. from the town is Holkham, the magnificent seat of the Earl of Leicester; and the country in the vicinity affords some of the best specimens of what is called the Norfolk system of farming.

WELSHPOOL, a par. and mun. bor., market town, and par. of Wales, co. Montgomery, hunds. Pool and Causae, on a branch of the Ellesmere canal, about 4 m. W. from the Severn, and 16 m. W. Shrewsbury. Pop. of par., in 1831, 4,533. The par. bor., which was formerly much larger, may now be considered as nearly co-extensive with the par.; but the mun. bor. is of much smaller extent. It is principally in a hollow, but partly also on the acclivity of an eminence leading towards Powys park and castle, a little S. from the town, but included within the par. bor.; it is well lighted with gas, and consists of one long and wide street, intersected by others of smaller dimensions, all well paved, and well supplied with water. The houses, which are of brick, have an unusual degree of regularity for this part of the country, the town being, on the whole, neat, cheerful, and English looking. The church of St. Mary, rebuilt in 1774, is a spacious edifice, in the pointed style, with a lofty square tower: it is situated at the base of an eminence, on which is the churchyard, which in some parts overtops the church, and commands a fine view of the town and adjacent country. The living, a vicarage in the gift of the bishop of St. Asaph, is worth 273*l*. a year nett. A new and handsome church on the W. side of the town has recently been erected on a site given by Lord Powys. Here, also, are places of worship for Baptists, Independents, Calvinists, and Wesleyans. The co. hall, in the centre of the main street, is a handsome brick building, with a colonnade. The co. hall, on the second floor, is 64 ft. in length by 25 ft. in breadth, and 18 ft. in height. Underneath is a spacious corn market and a court room for the co. assizes. A national school for both sexes, in which 250 children are instructed, was opened in 1821; and it has, also, a free school with a small endowment, almshouses for eight females, a dispensary, and several charitable bequests for the education of children and the distribution of charity among the poor.

From 1782 to 1834 Welshpool was the chief market in North Wales for the sale of Welsh flannels; but in the latter year the greater part of the trade was transferred to Newtown. The flannel manufacture carried on here is not of much importance: in 1838 two woollen mills were at work in the par., employing together about 30 hands. Flannel markets are still held once a fortnight; but the business is mostly conducted by private sales. (*Hand Loom Weavers' Rep.*; *Factory Returns*.) Malt-drying is carried on to a considerable extent, and there are several rather large tanneries. The Severn is navigable to within a short distance of the town; and by means of the Ellesmere canal it communicates with the Birmingham and Chester canal lines. Under the Mun. Reform Act the town is governed by 4 aldermen and 12 councillors; it has a commission of the peace, petty sessions for the hund. of Causae, a court leet, &c., and is, twice a year, the seat of the co. assizes.

Welshpool was formerly joined with Montgomery in the exercise of the elective franchise, but was disfranchised in 1728. Under the Reform Act, however, it has been again reinvested with the franchise, and is united with Llandidoes, Llanfyllin, Machynlleth, Montgomery, and Newtown, in returning one mem. to the H. of Com. Reg. electors, in this bor., in 1839-40, 256; in the united bors., 1,021. About 1 m. to the S. is Powys castle, the magnificent seat of Earl Powys. It stands on an elevated site, in the centre of an extensive and finely-wooded park. In 1828 the entire building underwent a thorough repair under the direction of its present proprietor. The principal entrance is a gateway between two massive round towers. It has in front two immense terraces rising one above another, the ascent to the castle being by a vast flight of steps. It is superbly fitted up, and has many fine pictures and works of art, including several pieces of sculpture from Herculespæum. In the vicinity are the Freddyn Hills, on the loftiest of which an obelisk has been erected in honour of Lord Rodney. Market day, Monday; fairs, six times a year. (*Parl. Reports*; *Welshmen's Cambrian Guide*; *Encyclopædia of N. Wales*.)

## WENLOCK (MUCH OR GREAT).

WEM, a market-town, par., and township of England, co. Salop, hund. Bradford, on the Roden, a tributary of the Severn, 11 m. N. by E. Shrewsbury. Area of par., 18,330 acres. Pop. of do., in 1831, 3,973. The town consists principally of one spacious street, from which several smaller streets branch off. The par. church, a handsome edifice, has a lofty tower and a fine chancel: the living, a very valuable rectory, with a curacy, worth 1,767*l*. a year, is in the gift of the Duke of Cleveland. The market-house is a neat brick and stone building; and in one of its rooms courts-leet are held, at which the two bailiffs governing the town are chosen. The free school, founded in 1651 by Sir T. Adams, a native of the town, who became lord mayor of London, and who also founded an Arabic professorship in Cambridge, has a total income of about 340*l*. a year, and two of Carew's exhibitions in Bridgenorth school. There are charities making provisions for the poor, but to no considerable amount. The inhab. of the town are mostly engaged in tanning and malling. Horsley supposes that Wem occupies the site of the ancient *Rutinium*: it formerly had a castle, but of this edifice nothing remains. The manor of Wem having come into possession of the crown by the attainder of Philip, Earl of Arundel, in the reign of Elizabeth, it was conferred by James II. on his fitting tool, chancellor Jeffries of bloody memory, who had the estate, and who was also created Baron Wem. Wycherley, the dramatist, was born near this town in 1640. Fairs six times a year, for cattle and stock, linen, and flax seed. (*Parl. Reps.*, &c.)

WENDOVER, a market-town and par. of England, co. Buckingham, hund. Aylesbury, in the vale of that name, 32 m. N.E. London. Area of par., 5,250 acres. Pop. of do., in 1831, 2,008. The town is inconsiderable, and meanly built; and would not, indeed, have been worth noticing in a work like this, but for the circumstance of its having enjoyed, from the 21 James I. down to the passing of the Reform Act, by which it was disfranchised, the privilege of sending 2 mems. to the H. of C. The right of election was nominally in the housekeepers not receiving alms, but really in the lord of the manor. The famous John Hampden (to whose family the manor belonged) represented Wendover in 5 successive parliaments. The living, a vicarage worth 300*l*. a year, is in the gift of the crown. Petty sessions are held once a fortnight; and courts leet and baron are also held in the town.

WENE and WETTER LAKES, two large lakes of Sweden, which see (*ante*, 739.).

WENLOCK (MUCH OR GREAT), a par. and munic. bor., market-town, and par. of England, co. Salop, hund. Wenlock, on a small tributary of the Severn, 11 m. S.W. Shrewsbury. Area of par. 4,420 acres. Pop. of do., in 1831, 2,424. The par. bor. is, however, co-extensive with the large district called "Wenlock Franchise," consisting of 16 parishes, in addition to that of Much Wenlock, the whole having, in 1831, a pop. of 12,435. The limits of the old municipal bor. were formerly identical with those of the par. bor.; but the modern municipal bor. is of much less extent, comprising only the 3 pars. of Dawley, Madely, and Broseley; the town of Wenlock itself being altogether excluded. The latter, though an inconsiderable place, and indifferently built, has some handsome residences. It consists chiefly of 2 streets, the houses being mostly of brick. The church, a spacious edifice in the Norman and early English style, has a tower surmounted by a spire at its W. extremity. The living, a vicarage worth 180*l*. a year, is in the gift of Sir W. Wynn. It has also a Wesleyan chapel, a free endowed school for 12 boys, almshouses for 4 women, and several minor charities. There are extensive limestone quarries in the vicinity, and copper mines, now abandoned, were formerly wrought to a considerable extent. The munic. bor. is divided into 3 wards, and is governed by 6 aldermen and 12 councillors. It has a commission of the peace, which is opened twice a year; petty sessions once a fortnight, or oftener if required; and a court of record, also once a fortnight: the last, however, has latterly fallen nearly into disuse. Corp. rev., in 1841, 98*l*.

Wenlock received its first charter from Edward IV., under which it sent, in 1478, 1 mem. to the H. of C., but Broseley and Little Wenlock being afterwards added to the bor., it was empowered to return 2 mems., a privilege it has since continued to enjoy. Previously to the Reform Act, the franchise was vested in the freemen of the bor., such freedom being acquired by birth or election. Reg. electors, in 1839-40, 949. Wenlock probably owed its origin to the foundation of a famous abbey, of which the ruins still exist, a little S. from the town. This edifice, founded towards the end of the 7th century, was mostly rebuilt, soon after the Conquest, in the Norman and early English styles. The entrance from Wenlock was by a strong gateway, one massive tower of which is still standing. Of the church, which dates from 1080, a large portion of the S. side of the nave, the whole S. wing of the transept, several arches on the N., and the foundation

tions of the choir and Lady Chapel remain. The ruins sufficiently attest the former magnificence and splendour of the structure, the precincts of which included an area of 30 acres. Its revenues amounted, at the dissolution, to 401*l.* a year. Markets, on Mondays; fairs, 5 times a year, principally for horses, cattle, and sheep. (*Parl. and Munic. Bound. Rep.*; *Munic. Corp. Append.*)

WEOBLY, a market-town and par. of England, co. Hereford, hund. Stretford, 10 m. N.W. Hereford. Area of par., 3,160 acres. Pop. of dg., in 1831, 819. The town consists principally of one street, having several modern and well-built houses. The church is a spacious edifice, to which are attached 2 or 3 ancient burial-chapels. The living, a vicarage worth 236*l.* a year, is in the gift of the Bishop of Hereford. A free grammar-school, founded in 1655, affords instruction to 15 boys. Here is also a national school for both sexes, supported by subscription. No particular branch of industry is carried on in the town, which, indeed, would not have been worth notice in a work of this kind, but for the circumstance of its having sent 2 mems. to the H. of C., from the reign of Edward III. down to the passing of the Reform Act, by which it was disfranchised. It has a market on Thursdays, but this is little more than nominal.

WESEL (Germ. *Niederwesel*), a frontier and strongly fortified town of Rhenish Prussia, reg. Dusseldorf, circ. Rees, of which it is the cap., on the Rhine, where it receives the Lippe, 30 m. S.E. Cleves. Pop., in 1838, 10,634. (*Berghaus.*) It is of high antiquity, and was formerly one of the Hanse Towns. It has some manufactures of cotton and woollen stuffs, leather, and tobacco, with distilleries, &c.: its port is convenient, and packets ply regularly between it and Amsterdam. Its defences have been a good deal strengthened by the erection of Fort Blucher on the opposite or W. bank of the Rhine. (*Schretter, Guide du Rhin, &c.*)

WESER (an. *Visurgis*), a river of N.W. Germany, its embouchure being in the North Sea, and its basin having that of the Elbe to the E., the Ems to the W., and the Rhine and Mayn to the S.W. and S. It is formed by the union of the Fulda and Werra. The former of these rivers has its source in the Rhöngebirge, about lat. 50° 27' N., and long. 10° E.; and traversing the electorate of Hesse-Cassel, it passes the cities of Fulda and Cassel. The Werra rises in the Thuringian Forest, in about the same lat., and long. 11°; and intersects several of the smaller Saxon territories, with parts of Prussian Saxony, Hesse-Cassel, and Hanover. Both have a general northerly direction, and unite at Minden, near the southern extremity of the Hanoverian dom. The combined river, or Weser, flows in a N. course, though with numerous windings, through the territories of Hesse-Cassel, Prussian Westphalia, Brunswick, Lippe-Detmold, Hanover, Bremen, and Oldenburg; falling into the North Sea by a wide estuary, about lat. 53° 30' N., and long. 8° 30' E. Its entire length is estimated at nearly 200 m. Its chief affluents are the Aller and Wumme. The Weser is of considerable commercial importance, Bremen being on its banks. Vessels drawing 7 f. water navigate it up to that city; and it is navigable for boats nearly to its commencement. Vessels drawing from 13 to 14 ft. water ascend the river to Vegesack, 13 m. below Bremen. Ships of large size stop at Bremerhafen, where a new harbour has been formed. Besides the foregoing towns, Minden, Nienburg, Rinteln, Hameln, &c. are on the Weser; and Hanover, Brunswick, Oldenburg, &c. are on its tributaries. (*Berghaus; Von Reden; Dict. Géog., &c.*)

WEST BROMWICH, a market town and par. of England, co. Stafford, hund. Offlow, on the high road from Birmingham to Liverpool, 5 m. N.N.W. Birmingham. Area of par., 6,380 acres. Pop., in 1831, 14,327; in 1841, 26,121. This, which was formerly an inconsiderable village, has increased rapidly in size and pop., in consequence of its situation in the centre of one of the principal coal and iron districts of the empire, and of the grand seat of the hardware manufacture. The main street, nearly 1 m. in length, contains some good houses; but the town is, for the most part, very irregularly laid out, and its proximity to coal-pits, gas, and iron-works, &c. gives it a black and very unprepossessing appearance. The old church of All Saints, on an eminence, in the N.E. part of the town, is in a mixed style of architecture, and surmounted by a tower. The living, a perpetual curacy, worth 566*l.* a year, is in the gift of the Earl of Dartmouth. Christchurch, a handsome Gothic edifice, erected in 1822, is a curacy worth 330*l.* a year. Besides a very fine Rom. Cath. chapel, there are various places of worship for Protestant Dissenters, and a national, and some other schools. The gas-works in this town, belonging to the Staffordshire and Birmingham Gas Company, are probably the most extensive of any in existence. They supply Birmingham, Bilston, Wednesbury, and a vast number of other towns and villages within a radius of 16 m. Here are also some extensive crown-glass works, which, with the gas manufacture, and the extensive collieries in the vicinity, furnish the

chief occupation of the labouring classes. The Birmingham and Dudley canals, in the immediate vicinity of the town, give it the benefit of very extensive water communications. Market-day, Saturday. E. of the town is Sandwell Park, the seat of the Earl of Dartmouth. The house is built on the site of a priory of Benedictine monks, founded in the reign of Henry II., of which some trifling remains may still be seen. (*Parl. Reps.*; *Railway Guide*; *Beauties of England and Wales, &c.*)

WESTBURY, a par. and munic. bor., market town, and par. of England, co. Wilts., hund. Westbury; at the N.W. extremity of Salisbury Plain, 25 m. N.W. Salisbury. The ancient bor. comprised only some portions of the town, but the modern bor. is co-extensive with the par. and hund. of Westbury, having an area of 11,340 acres, with a pop., in 1831, of 7,324, and in 1841, of 7,588. The town, which is insignificant and irregularly built, is scattered over a considerable surface, the principal street running nearly N. and S. The church, an old cruciform structure, has a tower rising from its centre, and some fine monuments. The living, a vicarage, to which are annexed the curacies of Bratton and Dilton, worth 238*l.* a year, is in the gift of the precentor of Salisbury cathedral. Here are several Dissenting chapels, a national school for 40 boys, endowed with 1,000*l.* by a benevolent burgess, who also bequeathed a like sum for the annual clothing of 20 poor women. The town hall, a handsome building, was erected in 1815. Westbury and its vicinity had formerly an extensive woollen manufacture, and though much fallen off, this branch of industry is still carried on, there being at work in the par., in 1838, 8 woollen mills, employing altogether 421 hands. (*Mills and Factories' Rep.*) Some malting is also carried on; and, upon the whole, the trade of the town, such as it is, may be considered in a thriving state. (*Munic. Corp. Appendix.*)

The charter by which Westbury was incorporated is not extant; the corporation, by which it has till lately been governed, consisted of a mayor, recorder, and 13 capital burgesses. Westbury returned 2 mems. to the H. of C. from the 27th of Henry VI. down to the passing of the Reform Act, which deprived it of 1 mem. Previously to the Act now referred to, the franchise was vested in the occupiers of 61 burgage tenements comprised in the old bor. Reg. electors in 1839-1840, 291. The bor. court, held annually on the 2d of Nov., is the only court held within and for the bor. The election of the bor. officers appears to be its principal duty. (*Munic. Corp. Appendix.*)

Westbury, though a place of considerable antiquity, is not connected with any historical event of importance. It has two annual fairs, and a nominal market every Tuesday. (*Bound. and Munic. Rep. &c.*)

WESTMEATH, an inland co. of Ireland, prov. Leinster, having N. Cavan and Meath, E. the latter, S. King's County, and W. Roscommon, (from which it is separated by the Shannon) and Longford. Area, 386,251 acres, of which 65,982 are unimproved bog and mountain, and 16,334 lakes. Surface agreeably diversified with woods, lakes, streams, hills, and bogs. The substratum being limestone, the verdure of the fields is remarkably fine, and the soil generally excellent. Property in moderate-sized estates. Leases commonly granted for 21 years, and a life. Grazing-grounds extensive. Tillage farms much subdivided, and husbandry, in most respects, similar to that of Meath, which see. Average rent of land, 13*s.* 7*d.* an acre. Principal rivers, Shannon, Inn, and Brosna. Westmeath is divided into 12 baronies and 62 parishes; and returns 3 mems. to the H. of C., viz. 2 for the co., and 1 for the bor. of Athlone. Registered electors for the co., in 1839-40, 2,497. In 1831, Westmeath had 23,803 inhab. houses, 25,331 families, and 136,872 inhab., of whom 67,700 were males, and 69,172 females.

WESTMINSTER. See LONDON.

WESTMORELAND, a marit. co. of the N. of England, having N. Cumberland, Durham, and Yorkshire, S. Lancashire and the extremity of Morecambe Bay, and W. Lancashire. Area, 487,680 acres, of which only 180,000 are said to be arable, meadow, and pasture. It is what its name (West-moor-land) imports, a region of lofty mountains, naked hills, and black barren moors; but the valleys, particularly those of the Eden in the N., and of Kendal in the S., are fertile and well cultivated. The agriculture, state of property, character, and condition of the occupiers of Westmoreland, are so similar to those of Cumberland, that the statements as to the latter may be applied, with very little variation, to the former. Average rent of land, in 1810, 9*s.* 1*d.* an acre being the lowest of any in England. Westmoreland abounds in slate of the finest quality; in lead; and, in some few places on its S. and W. borders, there are coal mines. Principal rivers, Eden, Lune, and Kent. The lakes are even more celebrated than those of Cumberland: Windermere, on the W. border, is the most extensive lake in England. The co. is divided into 4 wards and 32 parishes. It returns 4 mems. to the H. of

C. 1, viz. 2 for the co. and 3 for the bor. of Kendal and some adjoining districts. In 1841, Westmoreland had 10,848 inhab. houses, and 36,469 inhabs., of whom 23,234 were males and 28,235 females. Sum expended on the relief of the poor, in 1838-39, 14,732*l*. Total annual value of real property assessed to the poor rates in 1841, 268,336*l*.

**WESTPHALIA**, prov. containing all the N. portion of the Prussian dominions to the W. of the Weser, having N. Hanover; E. the latter, and some of the smaller German States; S. the latter, and the Prussian prov. of the Rhine; and W. Holland. Area, 7,801 m. Pop., in 1837, 1,317,841; of whom 749,782 are Catholics, 554,649 Protestants, and 13,016 Jews. Principal towns, Munster, Minden, Paderborn, Arnberg, Hamm, &c. It is divided into 3 regencies, and these again into 37 circles. Principal rivers, Ems, Weser, Lippe, &c. Surface in the E., N.E., and S., hilly or mountainous; but it is level in the middle of the prov., and in the N.W. adjoining Holland. In some places the soil is very fertile, but there are some pretty extensive marshes and heaths. Most part of this, as well as of the adjoining prov. of the Rhine, is divided into small farms, the occupiers of which live together in villages. The rent is paid sometimes in money, but frequently in produce or services, or both. The occupiers are a kind of copyholders, their lands descending from father to son. (*Jacob's Tour in Germany*, p. 103.) The Rhine provs. being in possession of the French, when the famous edict of 1811 was published, making copyholders freeholders in the old states of the Prussian monarchy, it did not apply to them. (*See PRUSSIA*.) Principal products, corn, flax, and potatoes. It is also productive of horses, cattle, sheep, and hogs. The latter furnish the Westphalian hams, so abundant in our markets, and so excellent. There is also great plenty of game and honey. There are vast beds of coal, with mines of iron, lead, copper, rock-salt, &c. with salt springs. Manufactures, principally linen, in the production of which 32,331 looms were wholly and occasionally employed in 1837: cottons, hardware, and cutlery, the latter being largely produced at Iserlohn, Dortmund, Hagen, and other places; with paper, spirits, tobacco, and various other articles.

**WESTPORT**, a sea-port town of Ireland, co. Mayo, prov. Galway, on a small river near the S.W. angle of Clew Bay, 42 m. N. by W. Galway, and 135 m. W.N.W. Dublin. Pop., in 1831, 4,428. This is a modern, neat, and rather nice-looking town. It occupies a narrow valley, and on each side and parallel to the stream by which it is intersected is a street planted with trees: the other streets branch from these on either side, and are for the most part inconveniently steep. The par. church is situated within Lord Sligo's park, immediately adjoining the town, and it has also a large Rom. Cath. chapel, with places of worship for Presbyterians and Methodists, several schools, a barrack, a market-house, a linen-hall, and court-house. A manor court, with jurisdiction to the amount of 10*l*. sterling, is held once a month; general sessions in April and October, and petty sessions on Thursdays. It is also a constabulary and coast-guard station. The linen trade was, at no very distant period, carried on extensively in this town and its vicinity. Latterly, however, this branch of industry has greatly declined, and the inhabs. are now principally dependent on the fishery, and on the export of corn, provisions, &c. The gross value of the exports of these, in 1835, was estimated at 87,805*l*.; of which corn, meal, and flour made no less than 83,547*l*., and linen only 560*l*! Several large flour-mills have been opened in the neighbourhood; and there are also distilleries and breweries. Branches of the Bank of Ireland and of the National Bank have been opened here. Post-office revenue, in 1830, 811*l*.; do., in 1836, 945*l*.

The port and corn warehouses are situated a little below the town, on the bay, vessels drawing 13 ft. water coming close to the quays. Clew Bay has at its mouth Clare Island, on the most northerly point of which is a lighthouse; there are many small islands within the bay, which, in many places, affords convenient and secure anchorage. Gross amount of customs duty collected here in 1840, 7,555*l*.

Crough Patrick, or the Reek, rising 2,499 ft. above the sea, is situated immediately on the S. side of the bay, 4 or 5 m. S.W. from the town. This is not only one of the highest, but also one of the most celebrated mountains in Ireland, being the spot where St. Patrick is said to have collected the snakes and other venomous reptiles from all parts of the island, and from which he precipitated them headlong into the sea! An altar or cairn is erected on the summit of the mountain in memory of this grand achievement, and it continues to be a frequent place of pilgrimage and devotion. The view from the summit is very magnificent. The land in the vicinity of the town is divided into very small portions, and the occupiers are, for the most part, miserably poor. Lord Sligo's park or demesne, to which strangers have access, is very fine; but the rest of his immense

estate is but little removed from a state of nature. (*Q. Social Returns*; *Anglia*, ii. 96, &c.)

**WEXFORD**, a marit. co. of Ireland, prov. Leinster having on the S. and E., St. George's Channel; on the N., the co. of Wicklow; and on the W., Carlow, Kilkeny, and Waterford Harbour, by which it is separated from Waterford. Area, 564,479 acres, of which 18,500 are unimproved moorland and bog. Surface, pleasantly diversified; climate mild. Soils either light or stiff clays. Property in pretty considerable estates; farms, of various sizes; but there is less of the extreme subdivision of land in this, than in most other Irish co. Dairies numerous, but badly managed; some districts have been long noted for their great crops of barley. Average rent of land 14*s*. an acre; but, in general, it is too high, and the competition for small patches is carried beyond all reasonable bounds. The barony of Forth, occupying the S.W. angle of Wexford, differs widely from the rest of the co., and, indeed, from every other district of Ireland. It was settled at a distant period by a colony from South Wales; and, till very recently, the Welsh language was spoken by every one, and is still understood by the older inhabs. The people are industrious, provident, peaceable, and cleanly. The farms are small, running from 10 up to 50 or 60 acres, but those from 30 to 40 are most common. Mr. Inglis says, that the land is clean, and well cultivated; that the crops of wheat and beans, both of which are extensively grown, are excellent; and that the improved Scotch plough with two horses is in universal use. The farm-houses are substantial, and the cottages clean and comfortable, forming, in this respect, a striking contrast with those in most other parts of the co. Persons of different religious creeds live in this barony harmoniously together. Land here, as in the rest of the co., very high-rented. (i. 49.) Wexford has neither minerals nor manufactures of any importance. Principal rivers, Slaney and Barrow. Wexford is divided into 8 baronies, and 142 parishes; and returns 4 mems. to the H. of C., viz. 2 for the co., and 1 each for the bors. of Wexford and New Ross. Registered electors for the co., in 1839-40, 3,604. In 1831, Wexford had 29,223 inhabs., 33,856 families, and 182,713 inhabs., of whom 87,965 were males, and 94,718 females.

**WEXFORD**, a parl. bor. and sea-port town of Ireland, prov. Leinster, co. Wexford, of which it is the cap., at the mouth of the estuary of the Slaney, on the W. or inner side of Wexford Haven, 67 m. S. by W. Dublin; lat. 52° 22' N., long. 6° 24' W. Area of modern parl. bor. 450 acres; pop. of dist., in 1831, 10,670. It is built wholly on the S. side of the river, and consists of a row of houses along the quay fronting the harbour, of a street parallel to the latter, and of numerous cross streets; but, excepting the quay, they are mostly narrow, irregular, ill-paved, and dirty. A long and poor suburb, principally occupied by fishermen, extends to a considerable distance S. from the town. Of 1783 houses in the parl. bor. in 1831, 1,113 were slated and 670 thatched. The communication with the country on the opposite side of the harbour is maintained by means of a wooden bridge, which, with its embankments, is nearly 1,700 ft. in length (measured on the plan in the Bound. Report), having a draw-bridge in the centre, and the river being navigable to Enniscorthy. The expense of keeping it up is defrayed by a toll. The public buildings and establishments comprise two Protestant churches, several R. Cath. chapels, two Methodist meeting-houses, the county court house, a large and handsome gaol, a fever hospital, house of industry, dispensary, lunatic asylum, a diocesan school for the see of Ferns, and various other schools; a R. Cath. college, supported by private endowment, a priory, a nunnery, a public library, chamber of commerce, assembly rooms, club-house, barracks, &c. The old walls, by which the town was formerly surrounded, were repaired in 1804, but they have since been allowed to go to ruin, and the suburbs extend considerably beyond them. Mating is carried on to a very considerable extent, and, in 1835, duty was paid on 202,449 gallons of spirits distilled in the town. The exertions of Father Matthew have, however, lessened this business.

Wexford Haven is of great extent, and has a fine appearance on a map; but it is shallow, and owing to a bar at its mouth between the two low, long, sandy peninsulas which form its external boundary, it cannot be entered by vessels drawing more than 9 or 10 ft. water, and even these should, with neap tides, have four hours flood to enter. But notwithstanding these drawbacks, Wexford, from her situation in a fertile county, and on a river navigable to a considerable distance by barges, and other circumstances, has a considerable trade, and is, in fact, one of the principal secondary ports of Ireland for the exportation of corn, meal, and butter. This is evident from the subjoined table. [*See top of next page.*]

Steamers ply once a week between Liverpool and Wexford. Excellent oysters are found in the bay, and the fishing business is carried on to a considerable extent. There belonged to the port, in 1841, 69 vessels of

STATEMENT of the Quantity and Value of the principal Articles exported from Wexford in 1835.

Articles exported.	Quantity.	Estimated Value.
Corn, meal, and flour - cwt.	486,485	175,180
Butter - "	18,000	54,000
Feathers - "	400	400
Wool - lbs.	50,000	3,000
Eggs - "	20	160
Spirits - galls.	480	96
Cows and oxen - head	3,000	36,000
Horses - "	300	3,000
Sheep - "	7,500	15,000
Swine - "	2,200	12,000
Other articles - value	-	16,000
Total -	-	312,136

the aggregate burden of 7,114 tons, exclusive of those below 50 tons. Gross customs revenue in same year, 9,357. Branches of the Provincial Bank, the Bank of Ireland, and the National Bank, have been opened here. Post office revenue in 1830, 1,971-11, ditto in 1836, 2,1342. Two weekly newspapers are published in the town. A patent slip and a building yard are attached to the harbour, and some little business is done in the building and repairing of vessels and boats.

Wexford has several charters, the first having been granted by the Earl of Pembroke, in 1318. Under the Irish Municipal Reform Act, 3 & 4 Victoria, cap. 108, the corporate body consists of a mayor, bailiffs, free burgesses, and commonalty. The bor. returned 2 mems. to the Irish H. of C. from 1374 down to the Union; and it has since returned 1 mem. to the Imperial H. of C. Registered electors in 1839-40, 405. The assizes for the co. are held here, with general sessions in January and at Midsummer, special road-sessions twice a year, and petty sessions and a bor. court for debts not exceeding 2*l.*, once a week. Markets on Wednesdays and Fridays. Fairs 6 times a year.

In 1649 Wexford was taken by Cromwell, when a considerable number of the inhabs. were put to the sword. During the rebellion of 1798 it was, for a while, the head quarters of the insurgents, by whom it was evacuated after the battle of Vinegar Hill. The town is possessed of considerable property; but it is let on long leases, at a low rate. (*Boundary Reports, and other official Returns.*)

Mr. Inglis says, "There are many good shops in Wexford, and I heard no complaint of the want of trade; and the best illustration I can give of the comfortable condition of the people is, that during the two days I spent in the town, I was not once asked for charity. I do not mean to say that there is not a pauper or a person out of employment in Wexford, but it may be said that it is a flourishing town." (1. 45.)

WEYHILL, a village of England, co. Hants, hund. Andover, within a short distance of the W. verge of Salisbury Plain, 15 m. N.W. Winchester. It is celebrated for its great annual fair, held for 6 or 7 days from the 9th of Oct. This, perhaps, is the largest fair in the S. of England for sheep, and is, also, a considerable mart for horses, cheese, and hops. At the fair which began on the 10th of October, 1840, it was estimated that above 150,000 sheep were exhibited for sale. A row of booths, called Farnham-row, is assigned exclusively to the dealers in Farnham hops, but hops from Kent, Sussex, &c., are also brought thither in considerable quantities. The horses exposed for sale are principally cart colts, and hunters; the cheese consists mostly of N. Wilt., Somerset, and Gloucester. The booths are formed into regular streets, and exhibit all the features of a large town, every part of which presents a scene of bustle and activity. On old Michaelmas day many farm servants are hired.

WEYMOUTH and MELCOMBE REGIS, two contiguous towns of England, forming together a par. munic. bor., and sea-port, co. Dorset, hund. Calford-Tree; on the English Channel, at the mouth of the small river Wey, 3 m. N. from the headland called the Isle of Portland, and 120 m. W. S.W. London. The modern par. bor., comprising the chapelry of Weymouth and the par. of Melcombe Regis, with portions of the adjacent par. of Wyke Regis and Radpole, had, in 1831, a pop. of 8,198. Weymouth and Melcombe lie on opposite sides of the harbour, that is, of the narrow outlet of an arm of the sea, called the Backwater, nearly 2 m. in length, being connected by a handsome stone bridge, erected over this outlet in 1770. The most considerable part of Melcombe consists of ranges of buildings situated on the N. side of the harbour, extending for nearly 1 m. in front of the esplanade along the sea, which here forms a fine semicircular bay. The houses here, which are large and handsome, are chiefly occupied by visitors attracted to the town by its unequalled advantages for sea-bathing, and other conveniences. But, with one or two exceptions, the greater number of the other streets are mostly narrow and dirty, with mean houses. Much

of the ground on which Melcombe stands is low, and has been reclaimed, at different times, from the Backwater. On the N., about 20 acres of this land have been recently enclosed for the purpose of forming a park, and between this and the sea there is a narrow space, which will probably be built over with good houses.

Weymouth, on the S. side of the harbour, not being resorted to by visitors, retains, in great measure, its original character of a fishing-town, and is irregularly and ill built. It is chiefly, in fact, inhabited by the labouring classes; in the outskirts, however, there are some good ranges of houses, and handsome detached dwellings. The par. church of Melcombe, rebuilt in 1817, though a spacious edifice, is not remarkable for its architecture: the living, a rectory in the gift of W. Wyndham, Esq., is worth 238*l.* a year nett. The chapel of ease in Weymouth, opposite the foot of the bridge, is a tasteful modern building in the Gothic style; the living, a perpetual curacy, is attached to the rectory of Wyke Regis, to which par. Weymouth belongs. There are several dissenting chapels; and in Melcombe are spacious assembly-rooms, a small town-hall, neat theatre, good libraries, baths, and other establishments usual at a watering place. There is a gaol, but of a very inferior description. Two national schools have been founded, and among other charitable institutions for the education and relief of the poor is a bequest of 75*l.* a year for the apprenticing of poor children. The town is lighted with gas; but the inferior streets are badly paved. Facing the sea is the lodge built for the residence of the royal family, by whom the town was frequently visited during the reign of George III. An equestrian statue of that monarch has, also, been erected at the N. extremity of the main street. On the Dorchester road, near the town, are barracks, now occupied as private houses. The harbour which, as already stated, consists of the inlet between Weymouth and Melcombe as far as the bridge is narrow, and the bar at its mouth has only 6 ft. water at low ebb; and, as spring tides here rise only 6 or 7 ft., the port cannot be entered by large vessels. There is, however, good anchorage in the bay, in 7 or 8 fathoms water. A battery, and several small forts have been erected at the entrance to the harbour.

Freestone from the Isle of Portland, Roman cement, bricks, tiles, &c. are among the principal exports. Ship-building, and rope and sail making are carried on to a small extent. In 1842, there belonged to the port 56 vessels, of the aggregate burden of 6,037 tons. Gross customs revenue, in 1840, 14,728*l.* Weymouth was of but little consequence till George III. made it his summer residence. Since then the town has continued to increase, and may be considered as flourishing; it is frequented by numerous visitors during the summer season, and a great number of respectable families have made it their permanent residence. The fine sands along the shore, and the gradually increasing depth and purity of the water, render it highly suitable for a bathing place. A raised terrace or esplanade has been constructed round a great portion of its picturesque bay, which constitutes the fashionable promenade of the inhabs. Races, and a regatta, take place annually in August.

Weymouth and Melcombe were originally distinct bors. In consequence of the continued dissensions between the municipal authorities of the two towns, a union of the bors. took place in the 13th of Elizabeth; and from that period down to the passing of the Reform Act, the united bor. possessed the privilege of returning 4 mems. to the H. of C.; but the above act reduced the number of mems. to 2: while, at the same time, some additions were made to the boundaries of the old bor. Registered electors in 1839-40, 660. Under the Municipal Reform Act, the town is divided into 2 wards; and is governed by a mayor, 5 other aldermen, and 18 councillors. It has a commission of the peace generally held once a year, with jurisdiction over all but capital offences; a weekly court of record, and 2 courts held, held annually at the same time and place as the sessions. The petty customs, harbour dues, &c. belonging to the corporation, are let by auction. Corp. revenue, in 1840, 570*l.* 4*s.* Markets, Tuesdays and Fridays; fairs, 3 times yearly. (*Parl. Reps., &c. Information.*)

WHEELING, a town or city of the U. States, in Virginia, cap. co. Ohio, on the Ohio, at the head of the steam navigation, 50 m. S.W. Pittsburgh. Pop. in 1840, 7,885. It stands in a narrow plain, at the back of which rises a range of steep hills, and consequently is built chiefly in one street along the river. The hills adjacent abound with coal. Besides the usual co. courts, offices, and buildings, Wheeling had, in 1835, 4 iron foundries, 4 steam-engine factories, numerous woollen and cotton mills, glass-houses, flour and paper mills, and manufacture of copperas, white lead, tobacco, leather, &c. About 34,000 ton of coal a year were then supposed to be consumed in its various factories, and 20 steam-boats were owned in the town, many of which, as well as keel-boats and barges, were built at Wheeling. (*Encyc. of Geog. Amer. edit.; Amer. Almanac.*)

**WHITBY**, a pari. bor. and sea-port town of England, N. riding co. York, liberty of Whitby Strand, at the mouth of the Esk, here crossed by a swing iron bridge, erected about six years ago. Instead of an old drawbridge, 42 m. N.N.E. York. Lat. of light-house,  $54^{\circ} 30' N.$ ; long.  $0^{\circ} 37' W.$  Pop. of pari. bor., which includes the townships of Whitby, Ruswarp, Hawsker-cum-Stainsacre, in 1831, 10,369. In 1841, 9,975. It is built along both banks of the Esk, the direction of which, from S. to N., determines that of the town; but, as the level ground by the river is of very limited dimensions, the buildings on both sides are carried up its banks, which, on the E. side, are especially precipitous. The houses, partly of stone and partly of brick, in the lower part of the town, are closely packed together, and the streets are for the most part narrow, while those on the banks are inconveniently steep; they are, however, well paved and lighted with gas, and some new streets on the W. side of the town are comparatively handsome; and since the new bridge was erected, the streets leading to it and to the pier have been widened, and the lower parts of the town much improved. The more opulent inhabs. have residences in the environs, which are beautiful and romantic. The church is inconveniently situated on the top of a cliff nearly 200 ft. above the sea, on the E. side of the town, the ascent to it being by a flight of 190 stone steps; but a spacious proprietary chapel was, about 60 years ago, constructed in the lower part of the town. The living, a curacy in the gift of the Archbishop of York, is worth 206*l.* a year nett. It has also places of worship for Methodists, Quakers, Presbyterians, Independents, Rom. Catholics, &c. Among the educational and charitable institutions may be mentioned, Lancastrian schools for children of both sexes; two infant schools; a seaman's hospital, for 42 widows and their children; a dispensary, established in 1786; a large workhouse, and several minor charities. The public buildings include the town-hall, erected in 1788; a building with public baths, and apartments for the subscription library, and the literary and philosophical society, erected in 1826; a handsome news room, custom-house, &c. The Union Mill, for supplying the members with flour at a reduced price, on the W. side of the town, is a conspicuous object. On the whole, "the appearance of the town is that of a substantial and wealthy sea-port." (*Bound. Report.*)

The harbour is formed by two piers; that on the W. side, 640 yards in length, terminates in a circular head, on which a light-house, having the lantern elevated 82 ft. above the sea, has been constructed. A noble quay, extending from the bridge to the west pier, is now being built, and, when completed, will form one of the finest promenades in the kingdom. The opposite pier extends about 215 yards from the cliff on the E. side of the river. The channel between the piers forms the harbour, which, however, labours under the drawback of nearly drying at low water; and in rough weather, when the wind is from the N. or N.E., a heavy sea is thrown in. To obviate the latter inconvenience, an internal pier has been built, and the inner harbour, or that above the drawbridge, is but little affected by the weather. There are dry docks and slips for the construction and repair of ships, the building of which, though less now than formerly, is carried on to a considerable extent: ships of the burden of 3,913 tons having been built here in 1841. The manufacture of sail-cloth, cordage, &c., is also carried on.

Whitby is principally indebted for its rise to the alum works in its vicinity, commenced in 1595: the exports of the alum, and the import of the coal required in its manufacture, giving birth to a considerable trade. This, however, is by no means so extensive as formerly. There are no alum works now very near to Whitby. Sandsard and Kittleness works, belonging to the Marquis of Northampton, are from 3 to 5, and the Peak works 8 m. off. The shipments of alum amounted in 1841, to 3,237 tons; and in 1840, to 2,747 do. There belonged to the port in 1842, 291 ships of the aggregate burden of 47,837 tons. Several of these ships were formerly employed in the N. whale fishery; but this having declined, the shipping belonging to the port is now principally employed in the Baltic, American, and E. Indian trades. Most of the large ships sail from London, Bristol, Liverpool, and Hull. Gross customs duty received at the port in 1841, 6,99*l.*W., having increased considerably since the establishment, about that time, of bonding warehouses.

The town is under the superintendence of the magistrates of the N. riding; and a manorial court of pleas for the recovery of debts is held every third Monday.

The Reform Act conferred on Whitby, for the first time, the privilege of sending 1 mem. to the H. of C. Registered electors, in 1839-40, 412.

Whitby abbey, which, having been destroyed by the Danes, was rebuilt after the Conquest, appears to have been a magnificent edifice. The ruins, in a commanding situation on the cliff near the church, are of considerable extent, and exhibit different styles of architecture. The neighbourhood of Whitby abounds with natural curiosities. In the alum rocks are found an immense variety

of petrified shells, trunks of trees, pieces of wood, bones of fishes, &c., and several highly interesting specimens of the large marine animals called *Ichthyosaurus* and *Plesiosaurus*, with fossil crocodiles, of which the finest hitherto discovered adorns the Whitby museum, which is particularly rich in specimens of the various organic remains found in the vicinity.

The country about Whitby is highly picturesque, and the beautiful valley of the Esk is also rich in ironstone of superior quality, with an admixture of lime. This has become of late an article of export to the iron works on the Tyne to the extent of from 20,000 to 30,000 tons a year. Freestone of several varieties, for building and engineering purposes, is also extensively exported to the London and other markets on the E. coast, as is also the whinstone (found in the same vicinity), for the repairing of roads when broken, and paving of streets, when shaped into blocks, for which purposes it is considered superior to granite. It is only since the formation of a railway from Whitby to Pickering, opened in 1836, that these mineral stores have been developed and made available. This railway passes for 24 m. through a succession of varied and highly picturesque scenery, affording, perhaps, the most beautiful ride of the kind in the kingdom. It is worked by horse power, and through its medium there is a daily communication (except on Sundays) with York. There are also daily coaches to and from Scarborough and the North. Since the opening of the railway, the fishery at Whitby has very materially increased. There are several mineral springs in the neighbourhood. Good lodgings may be had in the summer and autumn, rendering Whitby a desirable place of resort, where gaiety is not the only object. Market-day, Saturday, Fairs, August 25, and Martlemas-day. (*Private Inform.*)

**WHITCHURCH**, a market town and par. of England, co. Hants., hund. Evingar, in div. Kingsclere, on the road from London to Salisbury, 12 m. N. Winchester. Area of par., 7,630 acres. Pop. of do., in 1831, 1,673. The town is quite insignificant, and would be wholly unworthy of notice in a work of this kind, were it not for the fact of its having sent 2 mems. to the H. of C., from the 27th year of Elizabeth down to the passing of the Reform Act, by which it was disfranchised. The living is a vicarage, worth 140*l.* a year, in the gift of the Bishop of Winchester. An endowment to the amount of 102*l.* a year is applied to the purchase of bedding and clothing for the poor.

A little to the E. of the church, near the London road, are the paper mills, at which the paper for the notes of the Bank of England has been manufactured since the reign of George I. down to the present time.

**WHITCHURCH**, or **BLANCMINSTER**, a market town and par. of England, co. Salop, hund. E. Bradford, on the borders of Wales and Cheshire, 18 m. N. by W. Shrewsbury. Area of par., 15,380 acres. Pop. of do., in 1831, 5,819. The town is built on an acclivity, the summit of which is crowned by the church, a freestone edifice, erected in 1722 in the Tuscan order, with an embattled square tower 108 feet in height. The interior is handsome, and it has a good altar-piece, and 2 recumbent stone figures brought from the ruins of the old church, one of which represents Talbot, Earl of Shrewsbury, celebrated for his exploits in the wars with France under Henry V., and immortalised by Shakespeare in the 1st part of Henry VI. The living, a rectory, united with the rectory of Marbury, in Cheshire, is in the gift of the Countess of Bridgwater, and is one of the most valuable in the co., being worth 1,458*l.* a year nett. Here also are chapels for Unitarians, Baptists, Independents, Wesleyans, &c., and public schools and charities having an aggregate income of above 900*l.* a year. The grammar school, which has an income of above 450*l.* a year, instructs a certain number of boys, free of expense, in classics and mathematics, writing and accounts being paid for separately. The master and usher are allowed 312*l.* 12*s.* a year. (*Digest, &c. of Charity Repts.*) Courts leet and baron are held in the town hall by a high steward appointed by the lord of the manor. The inhabs. of Whitchurch are principally engaged in the malt and hop trade, in the manufacture of shoes, and lime and brick making. The Ellesmere canal comes up to the town. Markets on Fridays; fairs, 4 times a year, for farming stock, linen, and hempen and some woollen cloths. (*Parl. Rep. &c.*)

**WHITEHAVEN**, a pari. bor. and sea-port town of England, co. Cumberland, about 3 m. N.E. from St. Bees head, and 35 m. S.W. Carlisle; lat.  $54^{\circ} 32' 50'' N.$ , long.  $2^{\circ} 24' 56'' W.$  Pop. of the pari. bor., which includes the village of Preston, to the S. of the town, and a small rural district, in 1831, 16,894. The creek, on which the town is situated, is surrounded on the land-side by heights which approach close to the buildings. It is regularly laid out, the streets, which are of considerable width, cross each other at right angles, but they are, at the same time, ill-paved and dirty; and though there are many good houses and shops, a considerable proportion of the labouring pop. live in cellars. Among the public buildings are the three churches or

chapels of St. Nicholas, St. James, and Trinity; the first erected in 1693, the second in 1787, and the third in 1715; the livings, which are perpetual curacies, worth respectively £881., 2000., and 2500., are in the gift of the Earl of Lonsdale, on whose estate the town is built. Here also are chapels or meeting-houses for Methodists, Presbyterians, Anabaptists, Rom. Caths., &c. The educational establishments comprise a marine school for 60 boys, erected on ground given by Lord Lonsdale, and endowed by a citizen of the town; a national and an infant school, &c. It has, also, a theatre, erected in 1769, a subscription library and news-room, a custom-house, market-house, an infirmary, a dispensary, cold and hot baths, &c. There are dry docks and patent slips for the building of ships, which lie carried on to a considerable extent; and there are considerable manufactures of sail-cloth and cordage, copperas, tobacco-pipes, &c.; with a small soap-work, and iron and brass foundries. It has also two weekly newspapers, and two joint stock banks.

The harbour, formed by piers, constructed at different periods, dried till recently at low water; but it has been so much improved by the construction of a new pier on its S. side, projecting N., that a portion of it has now 9 ft. water at low ebb, and above 20 ft. at spring tides. Harbour light-houses have been erected on the outer and inner pier-heads.

Whitehaven, which, in the beginning of the 17th century, was a miserable fishing village, is wholly indebted for its rise and importance to the working of the coal mines in its vicinity, belonging to the Earl of Lonsdale. Some of these mines extend below the sea; and in the largest of them all, the William Pit, about 500 acres are excavated under the sea, the distance being about 2½ m. from the shaft, 110 fathoms deep, close to the shore, to the remotest part of the workings. There is, in this immense pit, a stable under the sea for 45 horses. (*Appendix*, l. 299, to *Report on Employment of Children in Mines*.) A new pit is now being sunk which, when completed, will run some miles under the sea, and will be the deepest in the country. The coal, which is of excellent quality, is principally shipped coastwise for Dublin, the Isle of Man, and the S. of Scotland. Thus, in 1841, the exports of coal coastwise from Whitehaven amounted to 451,370 tons; and those to foreign ports to 23,478 tons. Exclusive of its coal, Whitehaven exports considerable quantities of lime, freestone, iron-ore, &c.; and carries on a considerable trade with the W. Indies, America, and other foreign countries. Gross customs' revenue in 1840, 92,832. The town, however, is not flourishing, and both its trade and population have lately declined; a consequence, most probably, of the superior facilities enjoyed by Liverpool, both as respects the trade with Ireland, and that with the W. Indies, America, &c. The shipping of the port has fallen off materially during the last dozen years; still, however, it had, in 1842, 387 ships, of the burden of 62,115 tons. A piece of ground in the neighbourhood of the town, the gift of Lord Lonsdale, has been fitted up for bowls and other games.

The government of the town, and the care of the docks and harbour, is vested, under an act of Queen Anne, in 21 trustees, 14 of whom are chosen every 3 years by the inhabs. carrying on trade and paying harbour dues; and 6 are nominated by the lord of the manor (Earl of Lonsdale), who, being himself added to the list, completes the number. Courts-leet are held annually, and courts-baron monthly: the latter decide in cases of 40s. and under; petty sessions are also held by the co. magistrates. Markets, Tuesdays, Thursdays, and Saturdays.

The Reform Act conferred on this town, for the first time, the important privilege of sending 1 mem. to the H. of C. Registered electors in 1839-40, 508.

Adjoining the town on the E. side is Whitehaven Castle, a seat of the Earl of Lonsdale. The town is in the par. of St. Bees, about 4 m. from the village of that name, in which are two valuable institutions; the one being a college where persons of limited means are prepared for the church, and the other a richly endowed foundation school, affording great advantages to the youth of the neighbourhood.

A lighthouse of the first class has been erected on St. Bees-head. It exhibits a fixed light elevated 333 ft. above the level of the sea. (*Earl. Papers; Private Information*.)

WHITHORN, a royal and parl. bor. of Scotland, co. Wigton, the Burrow Head, the S.E. extremity of the co., and one of the principal headlands on the S. Scottish coast, being within the par. Pop. of the bor., in 1841, 1,513. The latter, about 4 m. N.W. from the Burrow Head, and 3 m. N.W. from its harbour at Isle of Whithorn, built partly on level ground and partly on a gentle acclivity, consists principally of one long and generally wide and well kept street, intersected in the middle by a rivulet concealed by a bridge the entire width of the street. The houses, which are all of stone, and mostly covered with slate, have been greatly improved of late years, many of those that were old and

inferior having been pulled down, and replaced by others of a superior quality. The present church, on a rising ground, a little W. from the main street, was built in 1822. It is a substantial and commodious edifice, but is totally devoid of architectural beauty, forming, in this respect, a striking contrast to most of the churches lately erected in this part of the country. Here also are places of worship for members belonging to the Associate Synod, and the Reformed Presbyterian Synod, and for Rom. Caths. The last two, however, have no settled pastors; and the individuals attached to their communion are widely dispersed over the country. The par. school is in a very efficient state, and there are several other schools, and a subscription library. The only public building is the town-house and gaol, surmounted by a tower and spire without any pretensions to elegance: the gaol is, also, ill-contrived and defective. Except the tanning of leather, which is carried on to some extent, the town has no manufactures; the inhabitants being either retail dealers, tailors, shoemakers, and other tradesmen, required for the accommodation of the surrounding district, or agricultural labourers. Some of them have small patches of land close to the town, for which they pay high rents. Two branch banks have, of late years, been opened in the bor. The inferior houses are mostly occupied by Irish immigrants, who are very numerous in this part of the country.

Whithorn was made a royal bor., by James IV., in 1511. It is governed, under the Municipal Reform Act, by a provost, 2 bailies, and 15 councillors. Corporation revenue, in 1839-40, 2300. 11s. 4d. It unites with Wigtown, Stranraer, and New Galloway, in sending 1 mem. to the H. of C. Registered electors in the bor., in 1841-42, 54.

Whithorn, which is of high antiquity, is supposed to be identical with the Leucophris of Ptolemy, and is certainly the Candida Casa of the venerable Bede. It was early distinguished in ecclesiastical annals, from the circumstance of a church being founded here late in the 4th, or early in the 5th century, by St. Ninian, who was buried within its walls. At a later period, or in the 12th century, a magnificent priory for monks of the Premonstratensian order was erected here by Fergus, lord of Galloway, of which there still remains a fine Saxon arch, embodied in the wall of the old par. church, and some extensive vaults. The real, or supposed, relics of St. Ninian having been collected in this building, it was regarded with feelings of extraordinary veneration, and was, for a lengthened period, a place of pilgrimage and adoration. Several of the kings and queens of Scotland were among the number of its visitors. On one occasion, James IV. made a pilgrimage thither, on foot, to secure the good offices of the saint in behalf of his queen, then dangerously ill. The bishopric of Galloway, or Whithorn, was one of the oldest in Scotland; and this was a principal residence of the bishops till the abolition of the see. (*Murray's Literary Hist. of Galloway*, Appendix, p. 332.)

The Isle of Whithorn, about 2 m. N.N.E. from the Burrow Head, and 3 m. S.E. from the bor., may be regarded as the sea-port of the latter. The isle, now united to the mainland by a causeway, is of very limited dimensions, not probably exceeding 30 or 40 acres. The village, which is built partly on the mainland and partly on the isle, has about 450 inhabs. The par. church is at Whithorn, and there is not, at present, any place of worship in the village. This, however, had not been the case formerly, there being on the isle the ruins of a small church said, though probably on no good grounds, to be one of the oldest in Scotland. A little ship-building is carried on; and there is some trade in the shipping of corn and other products to Liverpool and Whitehaven, and in the importation of coal, slates, freestone, timber, &c. In the angle between the W. side of the island and the mainland is the harbour. The only danger in entering is the *screens*, a ledge of rock, overflowed at high water, bounding the harbour on the S.W. But there is a broad channel between the extremity of the screens and the isle. Small vessels may run in at any time, and anchor within the screens till the tide makes, when there is water to bring large ships to the pier. The latter, constructed about 40 years ago, by means of a grant made by the convention of royal bors., is a very considerable and useful work. At high springs there are from 18 to 20 ft. water at the pier, and at neaps from 12 to 14 ft. The ground at the pier-head, and in the harbour is soft, so that vessels are but little injured by grounding. The steamers from Liverpool and Whitehaven seldom touch at the Isle of Whithorn, which is comparatively secluded; but in purity of air and water, mildness of climate, dryness of soil, cheerfulness, and salubrity, it is superior to most bathing places on the Scottish coast.

It may perhaps be thought, seeing their limited pop. and importance, that this notice of Whithorn and its port has been extended to an unnecessary length. But not being of the number of those who care nothing for the

## WICK.

place to which they belong, we may, perhaps, be excused, if, towards the close of this lengthened and laborious survey of so many countries and places, we have lingered for a moment over scenes once familiar, and still well remembered. The associations which the mention of this locality calls up are all "redolent of joy and youth," and are too soothing and pleasing to be instantly disclaimed.

WICK, a royal and parl. bor. and sea-port town of Scotland, E. coast of the co. of Caithness, of which it is the cap., on the river Wick, at the bottom of a deep bay, 18 m. S. by W. Duncanby Head. Pop. of parl. bor., which includes Wick, Pulteney-town, and Louisburg, in 1841, 4,592. Wick, properly so called, or the old town, is on the N. side of the river, and is irregularly and meanly built, and dirty: it has to the N. the suburb of Louisburg, and is connected by a bridge with Pulteney-town, on the S. side of the river. The latter, built on rising ground, feued from Lord Duffus by the British Fishery Society, is laid out on a uniform plan, and is one of the handsomest fishing villages that is any where to be met with. Both towns are lighted with gas, supplied by a company recently established. The par. church, at the W. end of the town with 1,835 sittings, was erected, in 1830, at a cost of 4,781 l.; but a chapel of ease is now (1842) about being finished in Pulteney-town, and the United Associate Seceders, Independents, Reformed Presbyterians, Rom. Caths., &c. have their respective places of worship. The educational and literary establishments comprise a parochial school, an excellent academy, several unendowed schools, two Sunday-schools, a subscription library, two reading-rooms, and a weekly newspaper. Exclusive of the churches, the town-hall, county buildings and prison, and commercial hall, are the principal public edifices.

Wick has been for upwards of half a century the principal seat of the herring fishery of Scotland; and, besides its own boats, its harbour is frequented, in the fishing season, by great numbers of boats from other parts of Scotland, and from Holland. Its port at the mouth of the Wick being small, inconvenient, and unsafe, a new harbour was commenced, in 1810, by the British Fishery Society, which they completed at a cost of 14,000 l., of which 8,500 l. were defrayed by government. But the accommodation being still insufficient, a new or outer harbour, of larger dimensions, and having deeper water, was completed, in 1831, at an expense of not less than 40,000 l. In 1840, the town had 765 boats at the fishery, of which 428 belonged to the town, and 337 to other places. The crews of these boats amounted to 3,923 individuals; and they are supposed to have given employment to about 4,000 other individuals, as gutters, coopers, sailors in coasters for carrying away the fish, &c. There were cured, at Wick, during the year ending the 5th of April, 1840, 91,465 barrels of herrings, being about one sixth part of the total quantity taken and cured in Scotland during the same year, including Sunderland and Whitby. Unluckily, however, the fishery is subject to great fluctuations, above 150,000 barrels having been taken in some years, and in others not more than 30,000 to 40,000 barrels. In consequence, the business partakes considerably of the nature of a gambling pursuit, and has not the beneficial influence that might otherwise have been expected.

The building of ships and boats, especially the latter, is carried on to a considerable extent; and the town has, besides, four rope-walks, a brewery and a distillery, an iron foundry, &c. The principal, or rather sole occupation of the females in and round the town consists in the spinning of yarn for, and in the making and mending of herring nets. The trade of the port is limited to the export of herrings, and of corn, wool, cattle, and other farm products, and to the importation of coals, timber, groceries, &c. It has an intercourse by steam with Leith, Aberdeen, Kirkwall, and Lerwick. There belonged to the port, in 1841, 34 vessels, of the aggregate burden of 1,753 tons. Gross customs revenue collected at the port, in 1840, 1,141 l. The Commercial Bank, and the Aberdeen Town and Country Bank, have each branches in the town.

Wick was made a royal bor. by James VI. in 1580. It unites with Kirkwall, Dornoch, Cromarty, and Dingwall, in sending 1 mem. to the H. of C. Registered electors in Wick in 1840—308. It is governed by a provost, 2 bailies, and 9 councillors. Corporation revenue, in 1840—41, 214 l. 4s.

The country in the vicinity of Wick has been very greatly improved within the last half century: even so late as in 1790, there was not a cart in the county, nor potatoes, turnips, nor rye-grass; and such a thing as a rotation of crops had not then been heard of. The land was split into minute portions, and held under a system subversive of all industry and improvement. The advance in the interval has been astonishingly great; and though there are still an excess of small occupiers, their numbers are gradually decreasing; and all sorts of improvements have been introduced, and are extending

## WIESBADEN.

themselves on all sides. To show the increase in the value of land, it may suffice to mention that the estate of Hemprigs, in the parish of Wick, let in 1783 for 642 l., was let in 1830 (exclusive of Pulteney-town) for 5,608 l. (*New Statistical Account of Scotland*, art. Wick; *Official Returns*, &c.)

WICKLOW, a marit. co. of Ireland, prov. Leinster, having N. the co. of Dublin, E. St. George's Channel, S. Wexford and W. Carlow and Kildare. Area, 494,704 acres, of which 94,000 are unimproved mountains and bog. This is a very mountainous co. In some places it is well wooded, and extremely picturesque and beautiful. Estates mostly large; the most extensive, valuable, and best cultivated belongs to Earl Fitzwilliam. Farms of various sizes; many small. Average rent of land, 12s. an acre. Speaking generally, rents are much too high; the labouring pop. not half employed; and their condition, and that of the small farmers, as bad as possible. But little wheat is raised, and that principally in the E. parts of the co. Wicklow has to boast of considerable mineral treasures; and some gold has been found in stream-works in different parts of the co. These, however, have been wholly abandoned, the produce of metal being insufficient to repay the expenses. From 600 to 300 persons may be employed in the copper mines of Cronebane, Ballymurtagh, Concora, &c. The ores are shipped at Wicklow, and are smelted in Wales. Bismuth, manganese, zinc, &c. have also been met with, but in inconsiderable quantities. Marl is very abundant in parts of the co., and is said to have wonderfully increased the fertility of some districts. Principal rivers, Slaney, Fustla, and Ovoca. Wicklow contains 6 baronies, and 58 par.; and returns 2 mems. to the H. of C., both being for the co. Registered electors for the latter, in 1839—40, 2,340. In 1841, Wicklow had 18,412 inhabited houses, 19,970 families, and 121,557 inhabs., of whom 61,062 were males, and 60,555 females.

WICKLOW, a marit. town of Ireland, prov. Leinster, co. Wicklow, of which it is the cap., at the mouth of the Vartry, 25 m. S. by E. Dublin, and 24 m. W. by N. Wicklow Head, on which there are 2 lighthouses with fixed lights. Pop. in 1831, 2,472. This, the poorest of assize towns, is irregularly built, and principally derives its means of support from the concourse of persons on its business and for bathing during the summer months. Its public buildings comprise the par. church, a Rom. Catholic chapel, meeting-houses for Methodists and Quakers, the court-house and prison for the co., diocesan school, market-house, co. infirmary, fever hospital, &c. Races are held annually on the Morrough, a flat sandy tract, extending several miles along the shore. The corporation, under a charter of James I. in 1613, consisted of a portreeve, 12 burgesses, and a commonality, which returned 2 mems. to the Irish H. of C. till the Union, when the bor. was disfranchised. The assizes for the co. general sessions and petty sessions, and a weekly court. The adjudication of small debts, are held here. The town is a constabulary and coast-guard station. Markets on Saturdays; fairs May 28, May 34, Aug. 12, and Nov. 25. The harbour is fit only for small craft, having a bar at its entrance which has only 9 feet at high water springs, and 6 feet at neaps. It has, however, some trade in the shipping of copper ore, corn, &c.; the value of its exports, in 1835, being 86,566 l. Post-office revenue in 1830, 342 l. in 1836, 356 l.

WIDIN, or VIDIN, a fortified town of Bulgaria, cap. sanjak, on the Danube, 130 m. S.E. Belgrade. Pop. estimated at from 20,000 to 25,000, being one of the most populous towns in this part of Turkey. It presents an imposing appearance from a distance, having numerous mosques and minarets; and its streets, though equally dirty, are said to be broader than in most other Turkish towns. It is the residence of a pacha of 3 tails, and a Greek archbishop; its trade is principally in rock salt, corn, wine, and other products of the surrounding territory. Its fortifications are in a pretty good state of repair, and it is one of the strongest towns in Turkey. (*Boul.* li. 336; *Dick. Geog.* &c.)

WIESBADEN, a town of W. Germany, cap. of the Duchy of Nassau, and one of the most frequented watering-places in the Confederation; on an affluent of the Rhine, 4 m. N. from the latter, and 6 m. N.N.W. Ments. Its resident pop. was, in 1831, under 10,000; but during the height of the season, the total number of its inhabs. has sometimes exceeded 25,000. The interior of Wiesbaden is badly laid out; but in its outskirts are many good streets and terraces. Being the seat of the government, superior courts, &c. of the duchy, it has some showy public edifices, including the ducal residence, the infantry and new artillery barracks, mint, Rom. Catholic church, theatre, &c. But most of its buildings consist of hotels, and lodging-houses for the accommodation of visitors; its chief prosperity and consequence being derived from its baths and mineral waters. These, the *Aqua Metallaci* of Pliny, are hot saline springs, containing muriate and sulphate of soda, muriate and carbonate of lime, muriate of magnesia and potassa, with

## WIGAN.

some silica, oxide of iron, and free carbonic acid. There are fifteen different springs; the principal of which is the *Kochbrunnen*, or "boiling spring," though its temperature is not boiling, but only about 158° Fahr. The other springs are not so hot, but all have the same general character, and are efficacious in cases of gout, rheumatism, paralysis, rigidity of the skin, &c. The usual time for drinking the waters, and taking baths, is from the middle of June to the end of August, during which all the usual attractions of a watering place are to be met with. The chief scene of gaiety is the *Kursaal*, a large edifice, with a central Ionic portico, which encloses, with its two wings, three sides of a spacious lawn, and comprises many magnificent apartments, including a noble saloon about 140 ft. in length and 50 in height. A band of music attends here every day during the season, and the *table d'hôte* is well and respectably attended. Besides this establishment, Wiscaden has a public library with 45,000 vols., museums of antiquities, and paintings, a well-managed hospital, &c.; with manufactures of chocolate, sealing-wax, and glue. The climate is very hot and oppressive in the height of the summer, and there is a deficiency of good ordinary drinking water; but the neighbourhood is very pleasant, and abounds with fine views and vineyards. Numerous Roman antiquities have been discovered in and about the town. (*Greenwich's Spas of Germany; Schreiber, Guide du Rhin; Chambers' Tour; Murray's Handbook for Germany; Berghaus, &c.*)

WIGAN, a parli. and mun. bor., market town, and par. of England, co. Lancaster, hund. W. Derby, on the Douglas, in the centre of an extensive coal-field, 17 m. N.E. by E. Liverpool, and 17 m. N.W. Manchester. The limits of the old parliamentary and municipal bor. were not affected by the Boundary and Municipal Reform Acts, and are co-extensive with the township of Wigan, which has an area of 2,170 acres, and had, in 1831, a pop. of 20,774, and in 1841, of 25,517. The town situated on a hill, is spread over a large extent of ground, and though irregular, is pretty well built; its appearance, however, is not prepossessing, as the employment carried on in it, and the abundance of coal, give it a dirty blackened look. Of late years its manufactures, buildings, and pop. have rapidly increased; several new streets, containing many good houses, have been erected; the approaches have been improved; and the whole town, which has been widely extended, especially towards the E., has every indication of augmenting wealth and prosperity. The charge for lighting, watching, and police, is defrayed by private subscription; and an ample supply of water is furnished by an incorporated company. The par. church is a stately old edifice, in the perpendicular style, with a handsome square tower; its interior is spacious and lofty, and it has several fine ancient monuments. Except on the S.W., it is closely surrounded by buildings. The living, one of the most valuable rectories in the county, being worth 2,230*l.* a year, is in the gift of the Earl of Bradford. Besides a chapel-of-ease and 8 places of worship for Protestant Dissenters, there are 2 large and handsome R. Catholic chapels. The town-hall, in a small market-place, nearly in the centre of the town, a large brick edifice, was rebuilt in 1720, and has a colonnade, added in 1828; the moot or sessions hall was rebuilt in 1829. Here, also, is a large commercial-hall, for the sale of woollen and cotton goods and hardware, erected in 1816; a small bor. gaol, a subscription library, established in 1787; a dispensary, founded in 1798, with a mechanics' institute, savings bank, &c. Towards the N. extremity of the town is a pillar erected in 1679, in memory of Sir T. Tildesley, killed in the engagement at Wigan on the 25th of Aug., 1650, between the royalists and the Earl of Derby, and the parliamentary troops under Colonel Lilburn. The free grammar-school, founded in the reign of James I., has since received various endowments, and is now in the possession of a considerable income. It is conducted under an act passed in 1812, and affords instruction to numerous scholars in classical learning, mathematics, the modern languages, &c. Here, also, is a blue-coat school, established in 1773; a school of industry, established in 1823, for the education of girls for domestic servants and housewives; and numerous Sunday-schools. The income arising from private legacies for the education and apprenticing of children, and general relief of the poor, amounts to between 350*l.* and 450*l.* a year.

The principal branches of industry carried on in the town comprise the carding and spinning of cotton, the weaving of muslins, calicoes, fustians, &c., by power and hand-looms; the manufacture of coarse linens; and more recently of silks. There are, also, in the parish bleachworks, brass and power, nail and machine factories, iron foundries, &c. In 1836, there were in the town only 25 cotton factories, which employed 4,262 hands; and in 1838, there were at work in the parish 37 cotton factories, which employed 6,137 hands, and 3 flax-mills employing 400 hands. (*Baines' Lancashire; Rep. on Mills and Fac-*

## WIGTON.

So early as 1720, an act of parliament was obtained for making the Douglas navigable from Wigton to the Ribbles at the point where the latter empties itself into the sea. This navigation was subsequently purchased by the Leeds and Liverpool Canal Company, and now forms an important branch of their works, conveying vast quantities of coal from Wigton to Liverpool and the N. of Lancashire. The North Union Railway, a branch of the Liverpool and Manchester line, passes through the town to Preston and Lancaster.

Wigan is a bor. by prescription; its earliest extant charter dates from the 3d of Henry III.; but numerous others have been granted by subsequent sovereigns. It sent 2 mems. to the H. of C. in the 23d of Edward I.; and made another return 12 years afterwards; but from that epoch till the 16th century, a period of more than 200 years, the privilege remained dormant. At its revival the right of election was vested in the free burgesses by custom, of whom, previously to the Reform Act, there were generally about 100. Registered electors in 1839-40, 565.

Under the Mun. Reform Act, the bor. is divided into 5 wards, and is governed by 10 aldermen, and 18 councillors. It has a commission of the peace, 2 courts held annually, petty sessions 3 times a week; and in 1841, it was purposed to establish a Court of Record for the recovery of small debts. Corp. rev. in 1840, 2,524*l.* A newspaper, called the *Wigan Gazette*, was first issued in 1836.

Wigan, anciently called *Wignin*, though not mentioned in Domesday-book, is certainly of considerable antiquity. A patent for paving the town, and erecting a bridge over the Douglas, was granted in the 7th Edw. III. During the civil wars it was zealously attached to the royalists. Dr. Leland, author of a "View of Deistical Writers," and of several other publications, was a native of this town, having been born here in 1691. Market days, Monday and Friday; fairs 2 times a year, chiefly for cattle, pedlary, and toys. (*Parli. Reps.; Baines' Lancashire, &c.*)

WIGHT (ISLE OF), the *Vectis* of the Romans, an island off the S. coast of England, opposite to, and included in, the co. of Hants, being separated from it by the road of Spithhead on the E., and by the Solent, or W. Channel, on the W. The E. Channel, from below Gosport across to Ryde, is about 3 m. in width; but from Hurst Castle across to the island, the W. Channel is little more than 1 m. in width. The figure of the island is rhomboidal, having its shores parallel to the opposite shores of the mainland. From its E. to its W. angle the distance is about 22 m.; and from the N. to the S., about 13 m. Area, 86,810 acres. Pop. of the island, in 1841, 35,431. This is one of the most beautiful districts in the kingdom, being finely diversified with hills, dales, woods, towns, villages, and gentlemen's seats. A range of chalk hills extends lengthwise across the island, affording excellent pasturage for sheep, and some very commanding views. The cliffs on the E. coast are bold and precipitous, and hollowed into chasms, the resort of vast numbers of sea-fowl. The cliffs, called the Needles, on the W. angle, are lofty, almost perpendicular, and strikingly picturesque. One of the tallest of these cliffs, being undermined by the action of the waves, was overthrown in 1782, and totally submerged. Climate extremely mild, and, perhaps, the most salubrious of any in England. Soil dry, loamy, and mostly very fertile; being well adapted for all sorts of agricultural purposes. The husbandry is similar to that followed on the good soils of the mainland (*see HAMPSHIRE*); and the island has large quantities of agricultural produce to dispose of after supplying its own inhabs. It is divided into two nearly equal parts by the river Medina. Large quantities of fine sand are shipped from Freshwater Bay, for the glass and china manufactures in different parts of the country; but it has no other minerals of any importance. Since the opening of the railway from London to Southampton, the Isle of Wight has been a great object of attraction, and is visited by crowds of tourists from the metropolis. A constant intercourse is kept up by steam between Southampton and Cowes; and individuals pressed for time may now leave London in the morning, and, after seeing a good deal of the island, return to town in the evening! Under the Reform Act, the Isle of Wight sends 1 mem. to the H. of C. Registered electors, in 1839-40, 1,167.

WIGTON, a market town and par. of England, co. Cumberland, on the Wiza, 10 m. W.S.W. Carlisle. Area of par. 11,800 acres. Pop. of do. in 1831, 6,501. The town, which is commodious and well built, consists principally of a main and transverse street, and has several superior inns and dwelling-houses. The par. church, a handsome building, was erected, instead of an older church, which had become ruinous, in 1788; it has attached to it a spacious Sunday-school, built by voluntary subscription in 1820. The living, a vicarage worth 120*l.* a year, is in the gift of the bishop of Carlisle. The grammar-school, established by subscription in 1714, but afterwards endowed, has now an income of above 70*l.* a year: at the time of the late charity inquiry 35 children were taught

set the foundation. An hospital for six widows of Protestant clergymen, founded in 1723, has an income of 58*l*. There are also several minor charities. The Wesleyan B. Catholics and Friends have meeting houses at Wigtown, and the Friends have, near the town, a school for 60 boys, founded in 1825. Wigtown is a place of some manufacturing activity; checks, gingham, muslins, flustans, &c. being made in the town and par., in which about 420 persons were employed as weavers in 1839. The gross average weekly earnings of the weavers at the same period was stated to be *ss.* 10*d.*, or nett 4*s.* 3*d.* per loom. (*Hand-loom Rep.*, part v.) Several breweries and tanneries are established here: iron and coal are brought to the town from within a distance of 5 m. Petty sessions are held monthly, and an annual court leet and baron in Sept. Markets, Tuesd. and Frid.; the former a considerable corn mart. Large fairs for horses, cattle, Yorkshire cloth, and hardware, Feb. 20. and April 5.; and one on Dec. 21. for butchers' meat, apples, and honey. About 1 m. S. Wigtown is Old Carlisle, probably a Roman station, of the ruins of which Wigtown old church was built. Ewan Clarke, the Cumberland poet, and Sir R. Smirke, were natives of Wigtown. (*Parl. Reps.*, &c.)

WIGTOWN, a marit. co. of Scotland, occupying the S.W. extremity of that kingdom, and forming the W. half of the district known by the name of Galloway, has on the S. and W. the Irish Sea, N. Ayrshire, and E. the Stewartry of Kirkcudbright or E. division of Galloway. It contains 253,760 acres, of which about a third part may be arable. Surfactile hills, but the hills do not rise to any considerable height. It is divided into three districts, viz. the *Marches*, extending from Wigtown and Portwilliam to the Burrow Head; the *Rhynns*, comprising the peninsula formed by Loch Ryan and the Bay of Luce, terminating in the Mull of Galloway on the S., and Corsewall Point on the N.; and the *Moors*, or upper district. The soil of the first two districts is, for the most part, a hazely loam, dry, and well adapted for the turnip husbandry; but near the town of Wigtown there is a considerable extent of rich alluvial land. The moors, which are bleak and barren, comprise more than a third part of the co. Climate mild, but rather moist. Property has, for a long series of years, been gradually accumulating in fewer hands, and is now, for the most part, distributed in large estates, held generally under entail: farms middle-sized, and uniformly almost let on leases for 19 years. Agriculture in this, as in most other Scotch cos., was formerly in the most barbarous and wretched state imaginable. There was no rotation of crops; the process and implements were alike execrable; the pasture land was overstocked; and the occupiers steeped in poverty. Marl, of which Galloway contained immense quantities, began to be discovered and applied to the land about 1730; and for a while it caused an astonishing improvement in the corn crops. But their unceasing repetition reduced the soil to its former sterility, and convinced the landlords that the marling, which promised so much, and by which so much had been realised, could be of no permanent utility to their estates, unless the tenants were restrained from overcropping. In consequence, principally of this feeling, but partly also of the diffusion of intelligence as to such subjects, it was the usual practice, previously to the American war, to prohibit tenants from taking more than three white crops in succession; and it was also usual to prohibit them from breaking up pasture land until it had been at least six or nine years in grass. This practice, barbarous as it is, was a vast improvement on that by which it had been preceded; and it prevailed generally throughout Galloway and Dumfriesshire till the beginning of the present century; and in some backward parts lingers even to this day. But in all the best parts of the district two white crops are now rarely seen in succession; and every department of husbandry has been signally improved. Generally, however, the co. is more suitable for pasture than for tillage; and it, as well as Kirkcudbright, suffered a good deal from overcropping between 1800 and 1815. Oats and barley principal crops; wheat, however, is now raised in considerable quantities. Potatoes largely cultivated. Turnips have been long introduced; but it is only since 1825 that their culture has become an object of general and profitable attention; it is now rapidly extending, and large quantities of bone-dust are imported as manure for the turnip lands. Farm houses and offices mostly new, substantial, and commodious. Roads new, and for the most part excellent. Breed of cattle polled, and one of the best in the empire. Breed of sheep in the low grounds, various; in the moors, principally the black faced, or *lintow*, variety. Average rent of land in 1810, *ss.* 6*d.* an acre. Minerals and manufactures, quite unimportant. The condition and habits of the people have been materially improved since the commencement of the late war with France. "They are now more cleanly, more comfortably lodged, and both their diet and their dress are of a better description. They are gene-

rally, also, intelligent and well informed. Their morality has also kept pace with the progress of society, and the more extensive diffusion of knowledge." (*New Statistical Account of Scotland*, art. *Wigtown*.) Principal rivers, Cree, Bladnoch, and Luce. It is divided into 17 par., and returns 2 mems. to the H. of C. viz. 1 for the co., and 1 for the bors. of Wigtown, Whithorn, and Stranraer, in this co., with which the inconsiderable bor. of New Galloway, in Kirkcudbright, is associated. Reg. electors for the co., in 1841-42, 998. In 1841, Wigtown had 7,440 inhab. houses, and 39,179 inhabs., of whom 18,258 were males, and 20,921 females.

WIGTOWN, a royal and parl. bor. and sea-port of Scotland, cap. of the above co., on rising ground near the mouth of the Bladnoch in Wigtown Bay, 13 m. N. N.W. the Burrow Head, and 37 m. W. S.W. Dumfries. The parl. bor., which includes a small village at the bridge of Bladnoch, about 1 m. S. from the town, had, in 1841, a pop. of 1,870. This, which is a well-situated and well-built country town, has been much improved of late years. It consists principally of a main street of great width, the centre of which has been enclosed, and is now occupied with a shrubbery, bowling-green, &c. A new and handsome granite cross has, also, been erected within the last few years. The only public building is the town-house and prison, with a low spire at one end. The prison, however, is both insecure and unhealthy; and will most probably be renovated at no distant period. The church, which is old and mean-looking, is situated in a retired churchyard, in which are monuments to various individuals put to death during persecutions under Charles II., for their adherence to the Covenant. The members of the United Associate Synod and the Relief have, also, meeting-houses: a considerable number of the Irish settlers in the town and parish are Rom. Catholics. The educational establishments comprise a well-conducted parish school, two unendowed schools, and two Sunday-schools. A subscription library, founded in 1794, has a good collection of books. If we except a distillery established at Bladnoch bridge, no manufacture of any kind is carried on in the bor. The harbour, on the Bladnoch, about  $\frac{1}{2}$  m. from the town, included in the port of Dumfries, nearly dries at low water, and the navigation is rather difficult. The only trade is in the shipping of corn, cattle, and other farm produce, coastwise for Liverpool and other ports, and in the importation of coal, timber, freestone, &c. The port is visited about once a fortnight by a steamer from Liverpool. A branch-bank of the British Linen Company is established in the town.

Wigtown was made a royal bor. by James III. It unites with Stranraer, Whithorn, and New Galloway, in sending 1 mem. to the H. of C. Registered electors, in 1840-41, 98. Under the Municipal Reform Act, it has a provost, 2 bailies, and 15 councillors. Corporation revenue, in 1840-41, 367*l.* 12*s.* 7*d.*, principally arising from the rent of land.

A convent and a monastery, both of which were founded in the 13th century, formerly existed here; but few or no traces of either the one or the other are now discoverable. (*Art. Wigtown in New Statistical Account of Scotland; Private Information.*)

WILMINGTON, a town or city, and port of entry of the U. States, in Delaware, co. Newcastle, between the Brandywine and Christina creeks, immediately above their junction, and 30 m. S.W. Philadelphia. Pop., in 1841, 8,367. It is built on gently-rising ground, in a pleasant and healthy situation, is regularly laid out, and its houses are mostly constructed of brick. It has a town-hall, a large almshouse, about 15 churches, 2 market-houses, an arsenal, public library, and many superior private (though no public) schools. It is supplied with water from works on Brandywine, on which is one of the largest collections of flour mills in the U. States. Cotton and woollen goods, paper, gunpowder, iron wares, &c. are made in Wilmington and its vicinity. The trade, both wholesale and retail, is extensive: there were owned in the district, in 1840, 16,111 tons shipping. The Christina is navigable up to the town for vessels drawing 14 ft. water: a railroad, 27 m. in length, connects Wilmington with Philadelphia; and others to connect it with different parts of Delaware and Maryland have been projected. (*Encyc. Amer.*; *Encyc. of Geog.*, Amer. edit.)

WILNA, or VILNA, a government of European Russia, comprising a large proportion of the ancient Lituania and Samogitia; principally between the 54th and 56th degrees of N. lat., and the 21st and 27th of E. long.; having N. Courland, E. Minsk, S. Grodno, and S.W. Poland and Prussia. Area, estimated at 24,600 sq. m. Pop., in 1818, 1,315,900. It is a vast plain; there being only, in different parts, a few sandhills, reaching sometimes to the height of 300 ft., and abounding with fossil, shells, &c. Principal rivers, the Wilna, a tributary of the Niemen, and the Niemen, which forms its S.W. boundary. Lakes are numerous, particularly in the E. and N.E. The soil is partly sandy, and partly marshy; but in many places it

consists of a fertile alluvial deposit. The climate, though severe, is not so cold as in some of the adjacent governments: the mean temp. of the year is about 45° Fahr. Agriculture is almost the sole occupation of the inhabs.; and rather more corn is grown than is required for home consumption. Rye is the grain principally cultivated. Hemp and flax are rarely grown; and hops and pulse are raised in gardens: fruits are neglected. The forests are very extensive, the crown possessing above 400,000 de-siatines of forest land; and there is a considerable trade in deals, timber, tar, potash, and other woodland products. Lime trees are very abundant; and to this cause is attributed the excellence of the honey, for which this government is famous.

The breeding of stock is neglected; the horses are, however, strong and active, though of small size. Game is very plentiful: elks, wild boars, bears, wolves, &c. are numerous; occasionally the urus is met with; and fox, martin, and squirrel skins are articles of trade. Mineral products unimportant. Manufactures have increased a little of late; but they are still quite inconsiderable. Dr. Granville says of Shavel, a town of 2,000 inhabs. in this gov. "It consists of a long street of low gable-roofed huts of wood plastered over, and presenting a general appearance of the most squalid misery. This may be considered as a fair specimen of the second-rate towns in the gov. of Wilna, and indeed all over Russian Poland." (*Travels*, ii. 516.) The trade, which is almost entirely in the hands of the Jews, is principally in timber and agricultural produce, sent down the Dvina to Riga, or by land into Prussia. Wilna is divided into 11 districts; chief towns Wilna, the cap., and Kovno. It is not subject to the government monopoly of ardent spirits; and preserves several of its old forms of administration. As respects education it is, though far behind, in advance of many of the governments.

WILNA, a town of the Russian empire, cap. of the above gov., and formerly the cap. of Lithuania, at the confluence of the Wilenka and Wilna, 90 m. N.E. Grodno. Pop., in 1834, 35,697, of whom 20,000 were Jews, they being more numerous here than in any other town of Polish Russia. It is surrounded by undulating hills, and enclosed by a wall. Its streets are narrow and crooked, and its houses mostly of timber, though it has several hundred dwellings built of brick or stone. Formerly a royal castle of the Jagellons existed here, but nothing is left of it except its ruins. The cathedral, founded in 1387, has some good paintings, and many chapels, one of which, appropriated to St. Casimir, and built wholly of marble is very handsome. The body of the saint is preserved here in a silver coffin, made by order of Sigismund III., and weighing, it is said, 30 cwt. 1 The church of St. John is surrounded by the buildings of the university, founded in 1578, and suppressed in 1832. Here are in all about 40 churches, numerous convents, a mosque, and 4 synagogues, a magnificent town-hall, an arsenal, exchange, theatre, 2 hospitals, barracks, magazines, &c. The governor's palace and some residences of the nobility are fine buildings. Previously to its dissolution, the university of Wilna was in a flourishing state, and possessed an observatory, collections in mineralogy, botany, and a library of 52,000 vols. A medical-chirurgical school, to which are attached the botanic garden and some of the univ. collections, an ecclesiastical seminary, and 2 gymnasia, are the principal public schools: most part of the university establishment has been removed to Kief. Wilna has deaf and dumb and foundling asylums, various other charitable institutions, a few manufactures, and a considerable trade. It was founded in 1322, and is reported to have had, in the middle of the 16th century, 100,000 inhabs., though this, no doubt, is a gross exaggeration. It has often suffered severely from fire. (*Schmidler; Pussart; Kaiserler, Russland.*)

WILTON, a pari. and munic. bor., and par. of England, co. Wilts, hundred of Devizes, on the W. bank of a tributary stream of the Avon, 4 m. W. by N. Salisbury. The old bor. comprised only the greater portion of the town; but the modern bor. includes, besides the whole par. of Wilton, 11 adjacent parishes and parts of 5 others, with an extra-parochial district; it has a total area of about 38,000 acres, and had, in 1831, a pop. of 8,315.

It is a neat country town; the main street is partially paved and lighted, and is crossed by a smaller street nearly in its centre. The public buildings, the principal of which are the church and town-hall, are not remarkable, nor do either these or the private houses appear to be increasing. (*Bound. Rep. &c.*)

The church is in a mixed style of architecture; the living, a rectory annexed to the livings of Netherhampton, Ditchampton, and Bullbridge, worth 450*l.* a year, is in the gift of the B. of Pembroke. It has, also, chapels for Independents and Wesleyans, an endowed free-school, established early in the 18th century, for the education and apprenticeship of 20 boys; a bequest of 1,000*l.*, the interest of which is annually distributed in marriage-portions to 4 young women belonging to the town, and several minor charities.

The hospital of St. John is the only one remaining of the numerous monastic establishments formerly existing here. The hospital itself is an old priory building, consisting of four distinct apartments under one roof, with a garden for the use of the inmates, who consist of 2 brethren and 2 sisters, presided over by a prior nominated by the dean of Salisbury cathedral. The rents reserved for the maintenance of the inmates amount to about 30*l.* a year. (*Charity Commissioners' Rep.*)

Wilton had, for a lengthened period, a flourishing manufacture of woollen goods, especially of carpets, and it was here, indeed, that the first carpet made in England was manufactured. This business, however, gradually declined; and though it has somewhat revived of late years, it is still but inconsiderable.

The earliest existing charter of the bor. dates from the 1st of Henry I., but from a very early period it has been governed by a mayor and an unlimited number of burgesses, including a recorder and five aldermen. This bor. sent two mems. to the H. of C. from the 23d of Edward I. down to the passing of the Reform Act, which deprived it of one of its mems. Previously to the last-mentioned Act the franchise was vested "in the mayor and burgesses, who are to do all corporate acts and receive the sacrament." In point of fact, however, it was a nomination bor. belonging to the E. of Pembroke. Reg. electors, in 1839-1840, 205. The only court that ever appears to have been held in the bor., except the court leet, is a court of record, which has not been opened since 1781. There is a small prison, now used only as a lock-up house.

Wilton is very ancient. It had a famous abbey, originally founded in 773, and greatly enlarged and enlarged after the Conquest. Wilton House, the magnificent seat of the Earls of Pembroke, occupies the site of this abbey. It is built in a fine park, watered by the Willy; its garden front was rebuilt from designs by Inigo Jones, and more recently it was enlarged and considerably altered by Wyatt, especially with a view to the better display of its superb collection of ancient statues and other works of art, paintings, &c. Wilton was most probably the birth-place of the dramatic poet Massinger; and archdeacon Cox, author of "Travels in Switzerland and the North of Europe," and of various valuable historical works, was, for a lengthened period, rector of Bemerton, in its immediate vicinity. The town has no market, but four annual fairs, that on the 12th of Sept. being one of the largest sheep fairs in the W. of England. (*Bound. and Munic. Reps.; Beauties of Wiltshire, &c.*)

WILTSHIRE, an inland co. of England, in the S. part of the kingdom, having N. the co. Gloucester, E. Berks and Hants, S. the latter and Dorset, and W. Somerset and Gloucester. Area, 874,880 acres, of which about 800,000 are arable, meadow, and pasture. It is divided by the rivers Kennet and Avon, and the canal by which they are united, into two grand divisions, popularly termed, from their situation, North and South Wiltshire. The latter consists, in great part, of Salisbury Plain, extending from Westbury and Warminster, on the N. to the co. of Hampshire, and from Marlborough, on the N. to near the city of Salisbury on the S. It consists principally of chalky downs, intermixed however with some fertile, well watered, and beautiful valleys. Though called a plain, the surface, as in all chalk land, is undulating: the most level part lies round Stonehenge. There is a good deal of rich land in the S. division, between Trowbridge and Pewsey, and between the Willy and the Dorsetshire border, E. to Wilton and Salisbury. Marlborough Downs, which bear in most respects a close resemblance to Salisbury Plain, lie in the N. division of the co., between Marlborough and Swindon; but, with this exception, this division consists principally of rich vale land, considerably exceeding in extent and importance the cultivated grounds of the S. division. There are some large estates; but property is notwithstanding, a good deal subdivided. Farms of all sizes; and generally let on lease, for 7, 14, and 21 years, with unobjectionable conditions as to entry. Farm-houses, in the S. division, were formerly built together for the convenience of water, but the more modern ones are generally detached. Agriculture in Wiltshire is in an advanced state, and reflects great credit on the skill and enterprise of the farmers. The land under the plough is remarkably clean and in good order. It is believed, however, that tillage on the down lands has been too much extended. When once broken up, it is extremely difficult to get them again into good condition as pasture; while, unless corn fetches a pretty high price, they are most productive in the latter. Principal crops, wheat and barley; the latter being, however, confined, in a great measure, to the light chalky soils. Turnips, rape or cole seed, and potatoes, largely cultivated. Much of the rich land in the N. division is appropriated to the dairy husbandry and the fattening of cattle. The cheese, which, excepting inferior butter made from the whey, is the only product of the dairies, was formerly sold as Gloucestershire cheese; but is now well known

and much valued in London and elsewhere by its own proper name of North Wiltshire cheese. Breed of cattle various: they are partly slaughtered in Bath, Salisbury, &c., but the greater number are sold to the London butchers. In despite, however, of the encroachments made by the plough on the downs, sheep continue to be regarded, in the greater part of the co., as the principal support of the farmer. They afford the chief article of manure used on the land; while the sale of lambs and wool furnishes the principal means of paying the rent. In consequence, as it would seem, of this dependence, and of the high price of wool during the last 10 or 12 years, there have been fewer complaints among the Wiltshire farmers than amongst those of most southern coes. The sheep stock, consisting partly of the native horned breed, but in a far greater degree of South Downs, and crosses between the two, is estimated at about 700,000; of which about 585,000 are depastured on the downs, and the rest on the cultivated land; the fleeces of the former are supposed to weigh at an average 2½ lbs., and those of the latter 4 lbs.; producing together about 8,650 packs of wool. The irrigation of water meadows is to be seen in the greatest perfection in S. Wiltshire, and is practised on a large scale. Many hogs are kept; and Wiltshire bacon is highly esteemed.

In the vicinity of some of the towns of S. Wiltshire, a good deal of garden husbandry is carried on. Average rent of land, in 1810, 18s. 6½d. an acre. Stonehenge stands, in rude magnificence, in the middle of Salisbury Plain. (See STONEHENGE.) The manufactures of Wiltshire are considerable; they consist principally of various descriptions of superfine woollen goods, made at Bradford, Trowbridge, Westbury, &c.; thickets, and other sorts of cotton goods, are also prepared, though in small quantities. Wilton was long celebrated for a carpet manufactory, established by one of the Earls of Pembroke; but this, though it has latterly increased, is not nearly so considerable as formerly. Speaking generally, manufactures of all sorts are here, as in other southern counties, on the decline. Principal rivers, Thames, Upper and Lower Avon, and Kennet. Exclusive of some local jurisdiction, Wilts contains 28 hundreds, and 300 parishes. It returns 18 mems. to the H. of C., viz. 4 for the co.; 2 for the city of Salisbury; 2 each for the bors. of Chippenham, Cricklade, Devizes, and Marlborough; and 1 each for Calne, Malmesbury, Westbury, and Wilton. Registered electors for the co., in 1839-40, 8,172, whereof 6,259 were for the N., and 2,913 for the S. division of the co. In 1841, Wilts had 50,986 inhab. houses, and 250,607 inhab., of whom 128,904 were males, 131,103 females. Sum paid for the relief of the poor in 1839-39, 129,524. Annual value of real property assessed to the poor, in 1840-41, 1,175,616d.

WIMBORNE MINSTER, a market town and par. of England, co. Dorset, hund. Bradbury; in a valley between the rivers Stour and Allen, each of which is here crossed by a bridge, 20 m. S.S.W. Salisbury. Area of par. 11,880 acres: pop. of ditto, in 1831, 4,009. The town is pleasantly situated; but the streets, though clean, are irregular, and the houses have but little uniformity: it is well supplied with water, and has been considerably improved of late years. It is principally remarkable for its magnificent minster or church, which was formerly collegiate. The date of its original foundation is uncertain; but it has been usually referred to the 8th century, when a monastery was established here by a sister of Ina, king of the W. Saxons. Dr. Stukely, however, and some other antiquaries are of opinion, that the E. tower, and most part of the church, are posterior to, but soon after the Conquest. It is a large cruciform structure, 180 ft. in length from E. to W., with two towers: one, a short, massive, Norman tower, rising from the middle of the roof, formerly surmounted by a lofty spire destroyed by lightning early in the 17th century: the other tower, in the Perpendicular style, at the W. end of the building, has a fine window, which has, however, been closed up. The interior is divided after the manner of a cathedral; and till within the last few years the cathedral service was performed here. In the chancel are 16 stalls, with canopies of carved oak. It has some monuments of distinguished personages; but time, and the hand of violence appear to have destroyed a great many more. This edifice underwent extensive repairs and improvements from 1836 to 1840, at the joint expense of Mr. Banks, the Earl of Devon, and the Duke of Beaufort. (Rickman's *Gothic Architecture*.) The living is a rectory in the patronage of the Earl of Shaftesbury. Here also are chapels for Independents, Wesleyans, and Baptists. The free grammar-school, originally founded in 1497, and re-established by Queen Elizabeth, has an income of about 100l. a year. Its freedom is unlimited, but in 1836 there were only 25 pupils on the foundation. Another free school, founded by the endowment of a private individual in 1696, has an income of 20l. a year, and in 1836 was attended by 16 pupils. St. Margaret's almshouse, which is of very ancient foundation, has an income of about 120l. a year, and the aggregate produce of the

funds for charitable and religious uses in the parish amounted, at the period of the late inquiry by the Charity Commissioners, to nearly 1,000l. a year. The trade of Wimborne is limited to that arising from a small manufacture of woollen goods, and stocking-knitting. Petty sessions are held here for the Wimborne division of the hundred, and an annual court at Michaelmas in a tything of the town, at which 2 bailiffs are appointed by 12 jurymen; but these have no authority over other parts of the town. Wimborne is supposed, from the various coins and antiquities found there, to have been a Roman station. Market day, Friday; fairs frequently, for cattle and cheese. (*Beauties of England and Wales*, art. *Dorset*, &c.)

WINCANTON, a market town and par. of England, co. Somerset, hund. Norton Ferris; on a declivity beside the small river Cale, here crossed by a stone bridge, 23 m. S. Bath. Area of par. 3,800 acres. Pop. of do., in 1831, 2,123. Wincanton, having been destroyed by fire in 1747, has been since regularly laid out in four principal streets. The church, a spacious edifice, partially rebuilt in 1748, has a square embattled tower. The living, a perpetual curacy worth 123l. a year, is in the gift of U. and G. Messier, Esqrs. It has, also, a chapel for Independents, a neat market-house, and several small charitable institutions. The manufacture of serges, bed-ticking, and dowlas, though much fallen off, is still carried on, and the silk manufacture has been introduced on a small scale. Wincanton is an important mart for the cheese made in the surrounding country. The town, divided into a borough and tything, is under the jurisdiction of separate officers; two constables for the former, and a tything-man for the latter, being chosen annually at the manorial court; besides which last, an annual court-leet is held here. Market-day, Wednesday; fairs, twice a year. Wincanton is a place of remote antiquity, and is mentioned in *Domesday Book*.

WINCHCOMBE, a market-town and par. of England, co. Gloucester, hund. Kiftsgate, amidst the Cotswold Hills, 6 m. N.E. Cheltenham. Area of par., 5,700 acres. Pop. of do., in 1831, 2,514. The town consists mostly of three streets: the houses are in general of stone. The church, the erection of which commenced in the reign of Hen. VI., is a noble Gothic structure, with a lofty square tower embattled and pinnacled; the nave is separated from the aisle by octagonal pillars and compressed arches, and from the chancel by a screen of carved oak. The living, a vicarage, worth 134l. a year, is in the gift of — Tracy, Esq. The free-school, founded in the 19th James I., has a yearly income of 49l. 4s., but has long declined from the condition of a grammar-school; and at the last inquiry it afforded only elementary instruction to 34 boys. An endowment of 20l. a year supplies clothing to the poor. (*Charity Reps.*) The inhabs. are principally occupied in the manufacture of silk goods, paper, leather, cotton stockings, &c.: in 1838, one silk mill in the par. employed 76 hands. (*Mills and Factories' Rep.*) Winchcombe is of great antiquity, and before the time of Canute formed a co. of itself, being then surrounded with walls, and having a famous abbey, founded during the Heptarchy, but of which, as of its ancient castle, there are now few or no traces. The town was made a bor. in the time of Edward the Confessor, but its charter has long been obsolete. About ¼ m. distant are the remains of Sudeley Castle, now the property of the Duke of Buckingham. (*Parl. Reps.*, &c.)

WINCHELSEA, a bor., cinque port, and market-town of England, co. Sussex, E. div. hund. Staple, on the small river Breed, about ¼ m. from the English Channel, 2 m. S. by W. Rye. Area of par. 1,150 acres. Pop., in 1831, 772. Old Winchelsea, a town of importance under the Romans, situated on the coast at the mouth of the Rother, was destroyed by the encroachments of the sea, between 1280 and 1287. Before its destruction was completed, the inhabs. removed to New Winchelsea, as it was called, on a slight eminence about 2 m. S.W. from the ruined town. The new town, which was surrounded with walls by Edward I., covered a space of about 2 m. in circ., had 3 churches, was regularly laid out, and enjoyed a considerable share of the trade with France, especially of that with Bordeaux. But, by a singular fatality, it was ruined by a cause precisely the opposite of that which had destroyed the old borough. Instead of encroaching, the sea began in the 16th century to recede from this part of the coast, leaving, in the end, the town without a harbour, ¼ m. from the sea, and in part surrounded with a salt marsh! Since this change was effected, it has progressively declined, and would most probably have been wholly deserted, but for the circumstance of its having enjoyed, from the 42d of Edw. III. down to the passing of the Reform Act, by which it was disfranchised, the important privilege of sending 2 m. to the H. of C. It is now included in the bor. of Rye. Of its three churches, only a portion of that of St. Thomas now remains. It has several old monuments, one of which is said by Rickman to be hardly exceeded by any in the kingdom for beauty of composition. The living, a

rectory in private patronage, is worth 378*l.* a year. The court-house and gaol underneath are of Saxon architecture. About a mile N.E. of the town are the ruins of Winchester Castle, built in the reign of Henry VIII. An inconsiderable market is held on Saturday, and a fair on the 14th of May, for cattle and pedlery. (*Bound. and Mun. Reps.*)

WINCHESTER, a city, parl. and mun. bor. of England, co. Hants, of which it is the cap., hund. Buddlegate, on the Itchen, here crossed by a modern stone bridge, 12 in. N. by R. Southampton, and 63 m. S.W. London; lat. 51° 3' 40" N., long. 1° 18' 26" W. The ancient parl. bor. was of very limited extent, and did not even include the whole city; but it is now wholly comprised in the modern parl. bor. (identical with the municipal bor.) with the adjacent hamlets of Winnal and St. Cross. Pop., in 1831, 9,292.

The town, standing on the declivity of a hill gently rising from the river, is regularly laid out, clean, well paved, and lighted with gas. In its centre is the High Street, a spacious thoroughfare, running from E. to W., with parallel streets on either side, crossed by others of nearly an equal length. Most of the S.E. part of the town, but without the limits of the city-proper, is occupied by the cathedral and some other ecclesiastical edifices and their precincts. The houses are mostly substantial, and well built, many of them being in an antique style, and having a venerable appearance. It was formerly surrounded with walls; but these no longer exist; and of four ancient gates only the W. now remains.

Of the public edifices the cathedral is by far the most interesting, partly from its vast size and antiquity, partly from the variety of its architecture, and partly from its ancient importance. It was founded in 1079 by Bishop Walkelyn, a relative of William the Conqueror, who constructed the crypts, transepts, and tower; the work was continued under succeeding prelates, and was nearly completed by the famous William of Wykeham, between 1370 and 1400. It is of a cruciform shape, with a low tower rising from the centre; and, though rather heavy, has a grand and imposing appearance. Its extreme length, from E. to W. is 345 feet; length of the nave from the W. porch to the iron doors at the entrance of the choir, 351 ft.; length of the choir, 136 ft.; breadth of the cathedral, 87 ft., and of the choir, 40 ft.; length of the transept, 186 ft.; height of the central tower, 150 ft. (*Milner*.) The character of the building was originally pure Norman, and the transepts and centre tower, built by Bishop Walkelyn, are admirable specimens of that style. The W. front, in the decorated Gothic, built by William of Wykeham, is singularly beautiful: it has a large and two smaller doorways, and a magnificent window, with two slender lantern turrets. The Norman parts of the building are bold, simple, and well executed; the tower massive and finely ornamented. The groining is varied in different parts of the church, and that of the nave is remarkable for its intricacy and richness. In its smaller structures, screens, monumental chapels, and stall-work, this cathedral is very rich. The altar-piece is of late Perpendicular; and over it is a painting, by West, of the Resurrection of Lazarus." (*Rickman*, 174.)

The coup-d'œil, on entering the cathedral by the W. door, is grand and imposing: the vast size of the building; the loftiness and long line of its vaulted roof; the lancet pointed windows shedding on the different objects a "dim religious light;" the lines of clustered pillars and branching aisles; the numerous chantries and monuments of eminent men; and the silence that prevails within its walls; conspire to impress the mind with a deep sense of awe and sublimity. In the middle of the presbytery, between the choir and the altar, is a coffin tomb said to inclose the remains of William Rufus, killed while hunting in the New Forest, and buried here in 1100. Several Saxon monarchs are also interred in this cathedral. Among the episcopal monuments, the most interesting are those of William of Wykeham and Waynflete, two of the most illustrious prelates of whom England has to boast. The first, who was bishop of this see from 1366 till his death in 1404, besides completing the cathedral, founded and endowed a college, or school, in the city, the scholars educated in which were afterwards to be sent to finish their university education in New College, in the university of Oxford, of which Wykeham was also the munificent founder. Waynflete, who was Bishop of Winchester from 1447 to 1466, founded Magdalen College, Oxford, one of the wealthiest foundations in that university. Here also are monuments in honour of the celebrated Bishop Hoadley, and of old Isaac Walton, the prince of anglers.

The bishopric of Winchester has long been one of the most valuable in the kingdom, its nett revenue having amounted, at an average of the three years ending with 1831, to 11,151*l.* a year: but, in pursuance of the recommendations of the Commissioners of Ecclesiastical Inquiry, its revenue will be reduced on the decease of the present incumbent.

The diocese includes 384 par., comprising, together with Hants, the greater part of Surrey and the Channel Islands. The cathedral establishment consists of a dean, 12 canons, and 8 minor canons, who enjoy amongst them a gross annual income of about 12,000*l.* a year. Winchester is said to have had at one time no fewer than 90 churches and chapels; but of these many were attached to monasteries and other religious establishments destroyed at the Reformation. There are still, however, as many as 9 churches in the city and suburbs. Of these the small church of St. Lawrence, scarcely visible for the buildings by which it is surrounded, is supposed to be the mother church of the city, and the bishop takes possession of the diocese by making a solemn entry into it. St. Maurice, the principal parochial church, was pulled down in 1840, and an elegant and commodious structure has been erected on the site of the ancient edifice, which had become inconvenient and ruinous; the expense of its construction was defrayed by subscription. Among the other churches are St. Swithun's, built over a postern gate; St. Michael's, a handsome modern edifice in the Pointed style, &c. The livings, except St. Bartholomew-Hyde, a vicarage, and St. John's, a perpet. curacy, are all rectories, and are in the patronage either of the Crown or the Bishop of Winchester. But notwithstanding the number of its established churches, dissent is here pretty prevalent; and the Independents, Baptists, Wesleyans, and Rom. Caths., have all places of worship. The chapel of the latter, a handsome edifice in the Pointed style of architecture, was constructed in 1792.

The college or school, founded, as already stated, by William of Wykeham, and completed in 1393, stands upon the site of a more ancient scholastic establishment. Its buildings enclose two large quadrangular courts, entered by spacious gateways; and besides apartments for the accommodation of the warden, scholars, &c., it has a noble hall and chapel. The whole structure is richly ornamented with pinnacles, buttresses, statues, &c. It is principally in the Perpendicular style. Over the door of the school, a noble hall constructed, in 1687, at the expense of gentlemen educated in the college, is a fine bronze statue of the founder, by Cibber, the sculptor, father of the hero of the "Dunciad." A building contiguous to the college is appropriated to the residence of the boys attending the school, but not on the foundation, where they are placed under the special inspection of the head-master. The building formerly used for this purpose being found to be inconvenient was pulled down, as well as the house of the head-master, in 1839, and a new and splendid edifice has since been erected in their stead, at an expense of about 25,000*l.*, defrayed by subscription.

This magnificent institution is the most ancient of the existing public schools of England, and formed the model for those of Eton, Westminster, &c. The establishment consists of a warden, a schoolmaster and usher, 10 fellows, 3 chaplains, 3 clerks, 46 choristers, and 70 scholars; but there are in general about 200 boys in the school, including those not on the foundation. Boys on the foundation are provided with board and lodging within the walls of the college; the only payments to which they are subject, exclusive of travelling expenses, amounting to about 20*l.* a year. Boys not on the foundation lodge, as already stated, in an adjoining pile of buildings, under the superintendence of the head-master, and subject to college discipline. Scholars are sent, as vacancies occur, from this school to New College, Oxford. (*See OXFORD*.) Among the distinguished individuals educated in this school may be specified Bishop Lowth, Sir Thomas Brown, Sir Henry Votton, Otway, the tragedian, Young, author of "Night Thoughts," Collins, the two Warton, &c.

Among the public buildings in the High Street is St. John's House, an ancient structure, formerly the property of the knights templars, and an hospital. The great room in this building, 62 feet in length and finely proportioned, was fitted up, in its present elegant style, by Geo. Brydges, Esq., a connection of the Chandos family, and a liberal benefactor of this city, of which he was long a parliamentary representative. It has a fine whole length portrait of Charles II., by Lely. In the rear of the building are neat edifices occupied by 6 poor widows, who, exclusive of their lodging, receive a weekly allowance of 10*s.* and other advantages. In 1833, an important addition was made to this charity, by the erection of a building, in the Elizabethan style of architecture, with a spacious quadrangle, intended to serve as an asylum for 13 aged females and 6 old men. Christ's Hospital, founded in 1586, supports 6 old men, 3 boys, and a woman. An almshouse, founded by Bishop Morley in 1672, supports 10 clergymen's widows. Here, also, are charity-schools for boys and girls, a national school for children of both sexes, and a mechanics' institute.

Among the public buildings may be specified the *cross* in the High Street, a fine structure of the age of Henry VI. in the later Pointed style, above 40 ft. in height. The guild-hall, rebuilt in 1713, has in front a statue of

Queen Anne. The original Winchester bushel of King Edgar, and other ancient standards of length and capacity, formerly preserved in this building, have been removed to an apartment over the W. gate of the city. A bridewell and house of correction has been erected on the site of a magnificent monastery, in which the remains of the great Alfred are said to have been interred. On the N. side of the city is the co. gaol. The co. hospital, in Parchment-street, is a fine structure, which has recently been considerably enlarged; a new corn-exchange was erected in 1838. Beyond the gate is an obelisk, erected in 1759, to commemorate a dreadful visitation of the plague to which the city was subjected in 1669. The places of amusement include a theatre, assembly-rooms, &c.; races take place in July, about 4 m. from the city. It has also a public-library and reading-rooms, and a savings bank.

Winchester has no manufactures, but a very considerable retail trade, and all the public business for the co. is transacted within its limits. "It may be considered, without hesitation, as gradually increasing in houses, population, and wealth. A large extent of the surrounding district belongs to ecclesiastical and other corporate bodies, which, not being empowered to grant long leases, give no encouragement to building; but wherever land held in fee-simple, or freehold land, can be procured, it was obvious, from our own inspection, that houses calculated for the habitations of the industrious classes were augmenting." (*Parl. Bound. Rep.*) The assize courts for the co. are held and other public business transacted in what was once the chapel of the castle, built by the Conqueror. (See *post*.) At the E. end of the hall is suspended a large round wooden table, 18 feet in diameter, popularly called "Arthur's Round Table," but which is, no doubt, of a much less remote antiquity. It was painted in the time of Henry VIII.

The circumstance of its being the cap. of the co. makes Winchester the residence of a great number of gentlemen connected with the law; and being also the residence of a number of superior clergymen, and of gentlemen attracted to the city by the beauty of the situation, and the facilities for education and amusement, the society is very superior. There are, indeed, but few places in England that seem so well fitted for the residence of people of slender fortune. Being within a very short distance of the Southampton railway, the access to London on the one hand, and to the S. coast on the other, is as easy and expeditious as can possibly be desired.

Winchester was first incorporated in the reign of Henry II. Under the Mun. Reform Act, it is divided into 3 wards, and is governed by a mayor, 3 other aldermen, and 18 councillors. It has a recorder, who holds courts, and a commission of the peace. Petty sessions are held twice a week, and also quarter-sessions. Corp. rev., in 1840, 2,075*l*. Winchester has sent 2 mems. to the H. of C. since the 23d of Edward I. Previously to the Reform Act, the right of election was vested in the members of the corporation, who had power to augment their number. Registered electors, in 1839-40, 618.

This is certainly one of the most ancient of the English towns. Under the Romans it was a place of considerable importance, and it subsequently became the capital of the West Saxons. William the Conqueror erected a castle here, under the pretence of protecting the city, which had suffered much from the incursions of the Danes, but really, perhaps, in the view of overawing the inhabs. From this period, however, London became the capital of the kingdom, and Winchester gradually declined in importance. But its castle was repeatedly occupied by the Norman monarchs; Henry III., hence called Henry of Winchester, was born here in 1207, and various parliaments were held in the city in the 14th and 15th centuries. Here, in 1552, Henry VIII. entertained his illustrious guest, the emperor Charles V.; and here the marriage of Mary, daughter of Henry, with Philip II., eldest son of Charles, was solemnised July 25, 1554. In the reign of Charles II. it again became, though for a short period only, a royal residence. Charles, indeed, was so much attached to Winchester, that in 1683 he employed the famous architect, Sir Christopher Wren, to erect a new and magnificent palace on the site of the old castle. The death of the king put a stop to the progress of the building, before it was finished; and, after various mutations, it is now used as barracks.

About 1 m. S. from the city is the ancient hospital of St. Cross, founded in 1132 by Henry of Blois, bishop of Winchester, and brother to King Stephen. The present establishment, which approaches nearer to a monastery than any other in England, consists of a master, a chaplain, a steward, and 12 resident brethren. The buildings once composed two courts; but they have been partly pulled down. The chapel, in the interior court, is built in the cathedral form, with a nave and transepts, and a low, massive tower at their intersection, and affords a fine specimen of the transition of the Norman into the Early English style of architecture. The entrance gateway has a handsome tower, with a statue of the founder, cardinal Beaufort.

No traces now remain of the monastery previously referred to as containing the remains of the great Alfred, rebuilt in the reign of Henry II., the revenues of which amounted at the dissolution to 865*l*. a year. Neither are there any remains of a university founded in the reign of Alfred, and other similar establishments.

About 4 m. E. by N. from Winchester is Avington, a fine seat belonging to the Duke of Buckingham. (*Parl. Reports; Camden's Britannia*, Gibson's ed., 1. 138*l*, &c.; *Guide to the City of Winchester; and Private Information*.)

WINDSOR, a town, parl. and mun. bor., par. and royal residence of England, co. Berks, hund. Ripplesmere on the Thames 20 m. W. by S. London. Previously to the Reform Act, the parl. bor. was nearly co-extensive with the par.; the modern parl. and mun. bor. comprises about half the par., with the lower ward of the castle, and a small portion of the adjacent par. of Clewer; having an area of about 4,500 acres, with, in 1831, a pop. of 7,071.\* The town, partly situated on low ground, along the river, and partly on the declivity of the ridge occupied by the castle, the W. end of which is surrounded by its buildings, consists of six principal and several smaller streets, and is well paved, and lighted with gas. It communicates with Eton, on the opposite bank of the Thames, by a handsome iron bridge of 3 arches, raised on granite piers. Of late years, many buildings of a superior kind have been erected in the W. part of the town, in that portion of Clewer par. included in the modern parl. bor. The par. church is a handsome new Gothic structure; the living, a vicarage worth 400*l*. a year, is in the gift of the crown. The guildhall, a neat edifice supported on columns and arches of Portland stone, occupies a conspicuous site in the High Street. On its N. side is a statue of Queen Anne, and on its S. one of Prince George of Denmark: in the interior are numerous portraits of royal and other distinguished persons. The cavalry and infantry barracks, the new royal stables, a neat theatre built in 1815, and several dissenting chapels, are among the other principal buildings. The charity school, founded in 1705, had at the date of the late enquiry an income of 167*l*. a year, and was attended by 55 children; it has, also, a ladies' charity school for girls, national and Sunday schools, &c. George III. established an hospital for invalid soldiers in 1784; a lying-in charity was founded in 1801, and the royal general dispensary in 1818, and there are numerous minor charities having an aggregate income of about 800*l*. a year. Windsor was first chartered in 1276, by Edward I., in the 30th of whose reign it began to send mems. to the H. of C., though returns have been regularly made only since the 25th Henry VI. The right of voting was formerly in householders paying scot and lot, who had resided for 6 months within the bor. Under the Boundary Act the alterations previously alluded to were made in the limits of the bor. Reg. electors, in 1839-40, 667. Under the Mun. Reform Act the bor. is divided into 2 wards, and is governed by a mayor, 5 other aldermen, and 18 councillors. It has a commission of the peace, and a court for the recovery of debts under 40*l*. Corp. revenue, in 1840, 1653*l*. Windsor has no manufacture of importance; and being out of any principal line of road, its trade is merely one of retail, being confined to the supply of goods to the inhabs. and visitors. It has numerous inns and lodging houses, though, considering the resort of company to the town, the former are certainly of a very inferior description to what might have been expected. The ale of Windsor enjoys a considerable reputation, and is sent to London and other places. The town supports 2 weekly newspapers. Markets, Wednesday and Saturday, the latter principally for corn. Fairs, Easter Tuesday, July 5. and October 4. for horses, cattle, sheep, and wool. (*Bound. and Mun. Corp. Rep.; Priv. Inf.*)

WINDSOR CASTLE is the principal country seat of the sovereigns of England, and one of the most magnificent royal residences in Europe. It appears to have been founded by William I. soon after the Conquest, and it had been enlarged or embellished by the greater number of his successors, particularly by Edward III., George III., and George IV. Under the latter it was, indeed, in great part rebuilt, and throughout renovated by Sir Jeffrey Wyatville, and has been fitted up in the most splendid style. Being placed on the summit of a lofty eminence rising abruptly on the S. side of the river, it commands very extensive views, and is, at the same time, a most conspicuous and interesting object from all the surrounding country. It

\* Eton and Windsor being so closely connected as to form in effect one town, it is not easy to see any good ground for excluding the former from the parl. bor. This exclusion will appear the more remarkable, when it is borne in mind that the limits of the parl. bor. were made to embrace the Lower Ward of the Castle, occupied by the poor Knights of Windsor, the Dean and Canons of St. George's Chapel, and other dependants on the court. Had the object been to must an independent constituency Eton would have been included in the parl. bor., and every part of the Castle excluded.

is of an oblong form, and is divided into an upper, a middle, and a lower ward, the entire area comprised within its outer wall being about 12 acres.

The upper or E. ward consists of a quadrangle, having on the N. the state apartments shown to the public; on the S. the apartments appropriated to the use of visitors; and on the E. the private apartments of the sovereign: on the W. the upper ward communicates, by the Norman and St. George's gateways, with the middle ward, a narrow inclosure round the base of the Round tower, which crowns the summit of an artificial mound in the centre of the castle. The lower ward, which is considerably smaller than the upper, has on its S. and W. sides the houses of the military knights, and the Salisbury, Garter, and Bell towers; and on the N. St. George's chapel, and Wolsey's tombhouse, behind which are other buildings inclosing several smaller quadrangles: it is entered from the town of Windsor at the S.W. corner by Henry VIII.'s gateway. On the N. side of the Castle, outside the state apartments and middle ward, is the North Terrace, originally constructed by Queen Elizabeth, and afterwards enlarged and improved by Charles II. This noble walk, resting partly on precipitous ledges of rock, and partly on masonry, rises about 70 ft. over the meadows at its base, and is at once the finest terrace of its kind in the kingdom, and a distinguishing feature of the Castle. On the E. side of the Castle, opposite her Majesty's private apartments, are the sunk or royal gardens, comprising about 2 acres.

The principal and most magnificent entrance to the Castle is on the S., by the gateway of George IV., between the York and Lancaster towers. The York tower, on the right hand, formed part of the ancient edifice; but the Lancaster tower is wholly new, its foundation having been laid on the 12th of August, 1824. The towers are symmetrical, being about 100 ft. in height, with machicolated battlements. Immediately opposite to this gateway is the principal entrance to the state apartments. The grand staircase, with the guard-room at its top, is, perhaps, among the happiest efforts of Wyattville's genius. The staircase is lighted by an octagonal lantern 100 ft. above the pavement, and has a marble statue of George IV. by Chantrey. In the vestibule is the collection of paintings by West, representing the exploits of Edward III.; and in the guard chamber are the coats of mail worn by John king of France, and David king of Scotland, while prisoners in the castle, with busts of Marlborough, Wellington, and Nelson, the latter on a pedestal formed of a portion of one of the masts of the Victory.

The decorations of the king's drawing-room are very superb: the ceiling is painted in compartments, representing the restoration of Charles II., the labours of Hercules, and other subjects; and on each side the room are numerous paintings by Titian, and the arms of several of the English kings. The ceiling of the audience-chamber has an allegorical representation of the church of England; and in the same apartment are West's installation of Knights of the Garter, and several portraits. The ball room, 96 feet in length, 32 feet in width, 31 do. in height, is finished in the gorgeous style of Louis XIV. It is hung in part with Gobelin tapestry, representing the story of Jason and the Golden Fleece, said to have belonged to the unfortunate Marie Antoinette. St. George's Hall, the banqueting room of the knights of the garter, is 200 feet in length, with an arched ceiling divided into compartments and panels, in which are nearly 700 shields, emblazoned with the arms of the knights down to the present time. At the E. end is the throne, under a rich canopy; and on the S. side of the hall are the portraits of the different sovereigns, from James I. to George IV., by Vanduyck, Lely, Kneller, Lawrence, &c. The Waterloo chamber, 100 feet in length by 46 in width, has portraits, principally painted by Sir Thomas Lawrence, of most of the sovereigns, warriors, and statesmen who took a prominent part in the contest with France terminated by the battle of Waterloo. The other state apartments do not require any particular notice; they have the inconvenience of all entering from each other, so that to get to the last in the range all the others must be gone through.

The entrance to her Majesty's private apartments is at the S.E. corner of the upper ward, through a handsome hall, from which a double staircase leads to a magnificent corridor 100 feet in length. The private apartments consist of a dining-room, 50 feet in length by 37 in width; a drawing-room, 68 feet in length by 30 in width; a smaller drawing-room, 40 feet in length by 25 in width; library, 50 feet in length by 40 in width; with bed-rooms, dressing-rooms, boudoirs, &c. These rooms are, as might be expected, most sumptuously furnished. The apartments for servants occupy the lower and higher stories of the palace.

The round tower was originally built by the celebrated William of Wykeham, the architect employed by Edward III. It stands on an artificial mound, and is approached

by a covered flight of 100 steps. From a court in the interior, another flight of steps leads to the battlements whence, in a clear day, portions may be seen of no fewer than 12 cos. This tower, which has been much modernized, is 32 feet higher than formerly, and is surmounted by a turret 20 feet in height, whence the royal standard is displayed: it is the residence of the governor of the Castle. At the base of the tower is a bronze equestrian statue of Charles II., erected by one of his pages.

The great object of interest in the lower ward is St. George's Chapel. "This is one of the finest perpendicular buildings in the kingdom: it is regular in its plan, and nearly all in one style. It is a cross church, with the transepts ending in octagonal projections which have 2 heights of windows. At each end of the aisle are also small octagonal projections sideways; all these are separated by screens, and form monumental chapels. In the E. wall of the chapel is a doorway of early English date; and perhaps other portions of a date prior to the present chapel may remain; but the whole of the chapel is a specimen of the perpendicular style in its advanced, but not latest, period. The roof of the nave is painted with armorial bearings, and the whole highly enriched, so that it now presents one of the best examples of the capability of English architecture for the reception of splendid colouring and gilding." (*Tickman's Gothic Arch.*, 124.)

The interior is divided by the screen and organ gallery into two parts, the body of the chapel and the choir. The W. end of the former is wholly occupied by an enormous window, fitted with painted glass, which, however, is deficient in brilliancy and richness of colouring. The fittings of the choir are mostly modern. St. George's Chapel was built between 1474 and 1516, chiefly under the direction of Beauchamp, bishop of Salisbury, and Sir Reginald Bray, minister of Hen. VII. It has served as the burial place of Hen. VI. (removed thither by Rich. III. from Chertsey), Edw. IV. and his queen, Hen. VIII. and Jane Seymour, and Charles I. It has a few old monuments, including that of Edw. IV., of hammered steel. Here also is a monument in honour of the late Princess Charlotte; but it is generally admitted to be in bad taste, stiff, and unnatural. Adjoining the chapel on the E. is Wolsey's tomb-house, built by Hen. VII., but which afterwards came into the possession of the Cardinal. James II. fitted it up as a Rom. Cath. chapel. It remained unoccupied from this era down to that of George III., by whom it was repaired, and a vault beneath it fitted up as a mausoleum for the royal family; and in it are now deposited the bodies of Geo. III. and his queen, Geo. IV., Will. IV., the Dukes of York and Kent, the Princess Charlotte, the Princess Augusta, &c.

But despite its magnificence, we confess that Windsor Castle appears to us to be extremely deficient in many things that one should expect to meet with in an ancient and favourite seat of the kings of England. Except the associations connected with the building, and the names of some of its towers and apartments, it has but little to connect it with the nation, or to make it an object of interest. In its interior, every thing has been sacrificed to gratify the taste of Geo. IV. for ostentation and vulgar finery. Not a single apartment has been allowed to continue in its ancient state, to carry us back to the days of the Edwards, the Henrys, Elizabeth, or even the Stuarts. Every thing that was venerable for its antiquity, or interesting from its history or associations, has been demolished or changed; so that one might suppose it had been wholly constructed within the last 20 years. Nor is there any thing in the fittings-up and embellishment of the apartments to atone for the destruction or metamorphosis of all that was old and interesting in the building. It has nothing to mark it out as the chosen seat of the constitutional sovereign of the British empire. Excepting the busts of Marlborough, Wellington, and Nelson, there is hardly, in the state-apartments, any memorial of any one of the many great men whose exertions have contributed to increase the power and glory of the British nation. We look in vain for either busts or portraits of Shakespeare, Bacon, Milton, Newton, Locke, Dryden, and Pope. Much as the English nation owes to Watt and Arkwright, Windsor Castle has no monument of either the one or the other. And the same may be said of most of our great parliamentary leaders, and even of the men who brought about the Revolution, and placed the Hanoverian family on the throne. The library is wretchedly deficient in books connected with the history and state of the country and its colonies; and, vast as is the building, it has neither a theatre nor an opera-house. One, in fact, might suppose that it had been fitted up for the residence of some opulent upholsterer; and except in its fine situation, size, and external appearance, it has but little appropriate to or worthy of its destination.

The Little Park is a fine expanse of lawn comprising nearly 500 acres round the E. and N. sides of the Castle. In it is the tree usually supposed to be identical with the Heron's Oak of Shakespeare. Windsor Great Park com-

prices about 3,800 acres on the S. side of the castle, being well wooded, and exhibiting a great variety of ground. Here is the long walk, a noble avenue, nearly 3 m. in length, extending in a straight line from the grand entrance to the Castle to the top of a hill, on which a colossal bronze equestrian statue of Geo. III., by Westmacott, has been erected. On the S. side of this hill is Virginia Water, an artificial lake, with a fishing temple in the Chinese style. Windsor forest, the theme of Pope's fine poem, is a tract 36 m. in circ. laid out by William the Conqueror for the purposes of hunting, and kept up by the succeeding sovereigns. Latterly, however, it has been mostly enclosed. Its limits embrace one market town, Wokingham, and numerous villages. One Windsor, where the Saxon monarchs are said to have had a residence, is on the Thames, about 1 m. S. E. Windsor. (For accounts of the Castle, the reader may consult *Jesse's Windsor and Eton*; and the different Guide-books.)

**WIRKSWORTH**, a market town and par. of England, hund. of same name, co. Derby, at the S. extremity of the lead mining district, 12 m. N.N.W. Derby. Area of par., 14,640 acres. Pop. of do. in 1831, 7,754; of the town, 3,787. The latter, in a valley nearly encircled by hills, consists principally of 2 streets formed by the intersection of 2 turnpike roads at right angles. The church of St. Mary, a spacious edifice in a mixed style of architecture, consists of a nave and side aisles, a N. and a S. transept, a chancel, and a square tower supported on 4 massive pillars. The living, a vicarage worth 164*l.* a year, is in the gift of the Dean of Lincoln. There are chapels for Baptists, Independents, and Wesleyans. A free grammar school, founded and endowed in 1570 by Anthony Gell, Esq., for an unlimited number of scholars, has an income of above 200*l.* a year. There are several almshouses, and the funds for general charities yield an income of above 130*l.* a year. The moot and sessions hall, erected in 1773, is a handsome stone building with shambles underneath. The lead mines in the vicinity, though now comparatively neglected, still furnish employment for a considerable number of the inhabs. In 1838, there were 3 cotton mills at work in the par., employing 612 hands. The other branches of industry consist of silk weaving, wool combing, and the making of hats, tapes, and hosiery. The Cromford canal passes about  $\frac{1}{4}$  m. to the N. of the town, crossing the Derwent by an aqueduct of one arch 80 feet in span; and the High Peak railway has also its terminus a little to the N. of Wirksworth. The town is under the jurisdiction of a constable and headborough. Petty sessions for the hund. are held weekly, and manorial courts every year in the moot hall, in which all business relating to the mines is decided. The manor of Wirksworth forms a part of the duchy of Lancaster. It was acquired by Sir Richard Arkwright, the great founder of the cotton manufacture, who died at his house at Cromford in this par. in 1792, and is now held by his son, Richard Arkwright, Esq. Market day, Tuesday; fairs 4 times a year for horned cattle. (*Beauties of England and Wales*, art. Derby; *Rep. on Mills and Factories*; *Charity Reps.*, &c.)

**WIRTEMBERG** (Germ. *Wurtemberg*) KINGDOM OF, one of the secondary states of the German Confederation, in the S. part of which it is situated, between lat. 47° 5' and 49° 35' N., and long 8° 15' and 10° 30' E., having N. W., and S. W. the territory of Baden; E. and S.E., Bavaria; and S., the Lake of Constance, and the Hohenzollern principalities, which last it nearly encloses. Its area, pop., subdivisions, &c. are given as follows, in the *Almanach de Gotha*, for 1842.

Circles.	Area in Eng. sq. m.	Pop. in 1838.	Pop. to sq. m.	Ch. Towns.
Neckar	1,306	458,143	351	Stuttgart
Black Forest	1,361	445,187	258	Reutlingen
Danube	2,449	580,000	234	Ulm
Jass	2,124	368,419	173	Ellwangen
Total	7,240	1,649,839	216	

**Physical Geography, &c.**—The surface is in great part mountainous, being covered by ranges of the Black Forest (*Schwarzwald*), Swabian, and Raube mountains. The Oberhohenberg, near Dellingen, rises to about 3,778, and the Kniebis to 3,100 ft. above the sea; but, in general, the various ranges are less than 3,000 ft. in height. Wirtemberg belongs partly to the basin of the Danube, and partly to that of the Rhine; besides which the principal rivers are the Neckar, with its tributaries, and the Iller, a tributary of the Danube. Except that of Constance, it has no lake of any importance.

The climate is mild in the sheltered valleys: at Stuttgart the mean temperature of the year is about 51° Fahr. The quantity of rain that falls varies, in different places, from 20 to 46 inches a year; but at Stuttgart is about 27·0 inches. As respects its productions, the country may be divided into 3 zones: the region of the vine, which extends to about 1,000 ft. above the sea; that of

fruit and corn, to 3,000 ft.; and that of corn and forests, comprising all above the latter elevation.

**Agriculture** is the principal occupation of the mass of the pop. The arable lands have been estimated to comprise about 2,440,000 morgen; vineyards, 84,778 do.; gardens and orchards, 150,650 do.; pasture lands, 738,000 do.; and forests nearly 2,000,000 do. Spelt, oats, barley, rye, and wheat are the grains principally cultivated; and a larger quantity of corn is usually produced than is required for home consumption: in 1834, a surplus of 148,000 *scheffels* was exported. Potatoes are raised in large quantities; and Berghaus has estimated the annual crop at 3,000,000 *scheffels*. Pease, beans, turnips, hops, and tobacco, are only partially cultivated. The wines grown on the Neckar are tolerably good; and altogether Wirtemberg produces annually about 155,000 cimers of wine, of the estimated value of 3,100,000 *fl.*; but a great deal of this is grown at a considerable elevation on the banks of the Lake of Constance, and elsewhere, and is of a thin and indifferently quality. Apples, pears, apricots, and other fruits of temperate climates, including even figs and melons, come to perfection, and small quantities of elder and perry are made. The forests are an important source of wealth. Pine, fir, and cedar are the principal kinds of trees; but oaks, beeches, &c. are also numerous. The timber cut in the Black Forest is estimated to produce upwards of 400,000 *fl.* a year. According to Berghaus, there are upwards of 800,000 head of cattle, 93,000 horses, 586,000 sheep, and 122,000 hogs in the kingdom; and the value of the wool produced annually may be about 1,713,000 *fl.* (*Allg. Länder. &c.*, iv. 254.) There are numerous associations for improving the different branches of rural industry; and government spends considerable sums in the encouragement of agriculture.

Salt is one of the principal mineral products, and between 400,000 and 500,000 centners a year are obtained from salt springs; of which quantity, about 230,000 centners are consumed in the country, the rest being exported, principally to Switzerland. Coal and lignite are found, but in no great quantities; iron ore, slate, building and mill stone, alabaster, gypsum, nitre, and potters' clay are, however, more or less abundant; and in the Black Forest are several mineral springs frequented by visitors.

**Manufactures** of linen and linsey-woolsey fabrics, hosiery, and woollen cloths are carried on in most of the peasants' houses; and in some places to such an extent, that, in the little village of Leichingen, there are 400 hand-looms, which annually produce 400,000 ells of linen. The manufacture of wooden clocks, toys, &c., exported to all parts of Europe and America, is extensively carried on in the Black Forest and other parts. Cotton yarn is spun, and cotton cloth woven by machinery, in Stuttgart and Obendorf; and woollen yarn, stockings, leather, paper, glass, and tobacco, and tobacco-pipes are manufactured in the principal towns; and there are also a good many dyeing-houses, glue factories, breweries, distilleries, &c. The principal exports consist, however, of cattle, wool, corn, timber, fruit, wine, seeds, hemp, iron, salt, pitch, tar, oil, and other raw products, which are sent down the Neckar, Rhine, and Danube. The total value of the exports and imports may be respectively estimated at from 15,000,000 to 18,000,000 *fl.* a year. Wirtemberg, at one period, proposed with Bavaria to join Austria in a commercial union for the S. of Germany, in opposition to that established by Prussia in the N.; but the proposal being rejected, Wirtemberg, like Bavaria and Baden, is now a member of the Prussian Commercial League.

Accounts are kept in gulden or florins, worth about 1*s.* 8*d.*, divided into 15 *batzen*, or 60 *kreutzers* of 6 *hellers* each. The ell, about 2 ft. English; the *morgen* = nearly 2·3*ds* acre; the *scheffel* = 7·588 cub. in.

The Government is an hereditary monarchy, limited by the constitution of 1819. The parliament consists of 2 chambers, called together every 3 years, or oftener, if necessary. The first chamber is composed of the subordinate members of the royal family, the mediatized princes, and the heads of the principal noble families: the second chamber, or House of Representatives, consists of 94 mem<sup>r</sup>s, including 13 of the inferior nobility, 6 Protestant superintendents, the Rom. Cath. bishop, and other dignitaries, the university-chancellor, deputies from the towns of Stuttgart, Tübingen, Ludwigsburg, Ellwangen, Ulm, Heilbronn, and Reutlingen; and a representative from each rural district, chosen every 6 years. Members of the second chamber must be 30 years of age. The administration is conducted by 5 ministers of state, who, with a president, form the privy council. The supreme judicial court in Stuttgart is divided into civil, criminal, educational, and matrimonial tribunals; and in each of the circles, districts, and communes there are courts of justice. The reigning house, which had been previously Protestant, became Rom. Cath. in 1773, without, however, the change having any material influence over the religious persuasion of the people. Of the pop., in

## WISBEACH.

1838, 1,124,929 were Lutherans; 418,200 Rom. Caths.; and 11,266 Jews. In respect of education, Wirtemberg ranks very high. In 1800, it was estimated that 1 in 7 of the pop. was receiving public instruction; and, according to Berghaus, every individual in the kingdom is able to read and write, except a few in that part of the country called the Suabian Terrace, where the Neckar rises. It has a university (at Tübingen) a lyceum, and gymnasia, in all the principal towns, with ecclesiastical, citizens', and other schools; and a primary school in every village. The total armed force consists of 19,500 men, including 8 regiments of infantry, 4 of cavalry, and 3 companies of artillery, with train, &c. The public revenue, at an average of the 4 years ending with 1841, amounted to 9,667,835 Rhenish florins a year: the public debt, in 1839, was 24,024,179 fl.

Mr. Loudon, who travelled over most part of Wirtemberg, in 1828, says, "From what I have seen of this country (Wirtemberg) I am inclined to regard it as one of the most highly civilised in Europe. I am convinced that the great object of government is more perfectly attained here, than even in Great Britain; because, with an almost equal degree of individual liberty, there are incomparably fewer crimes, as well as far less poverty and misery. Every individual in Wirtemberg reads and thinks, and to satisfy oneself that such is the case, he has only to enter into conversation with the first peasant he meets; and observe the number and style of the journals that are every where circulated; and the multitude of libraries in the towns and villages. I did not meet with a single beggar in Wirtemberg, and with only one or two in Bavaria and Baden. The dress of the inhabs. of Wirtemberg, as well as those of a great part of Bavaria and Baden, appeared to me to indicate a greater degree of comfort than I had ever observed in any other country, with the exception, perhaps, of Sweden and of the Lowlands of Scotland." (*Loudon's Letter to Count Lasperre.*)

*History.* — Wirtemberg derives its name from a castle near Stuttgart, the principal seat of the reigning family. It was formerly a dukedom. The French overran the country in 1796; but the sovereign having made his peace with the conquerors, important additions were made to his territories in 1800; and soon after the battle of Austerlitz, Napoleon raised the duke to the rank of king. Under the congress of Vienna, Wirtemberg holds the sixth rank in the German Confederation, with 4 votes in the full diet and 1 in committee; and contributes 13,355 men to the confederated army. (*Berghaus; Allg. Länder, &c.; Stein's Handb. der Geog.; Diet. Geog.; Memminger; Besch. von Württemberg.*)

WISBEACH, a mun. bor., market-town, river-port, and par. of England, co. Cambridge, hund. Wisbeach, in the Isle of Ely, close to the border of Norfolk, on the Nene, here crossed by a fine stone bridge of one arch, 11 m. S. from the mouth of the Nene, in the Wash, and 32 m. N. Cambridge. The old bor., of very irregular shape, was co-extensive with the par. of St. Peter's: the modern bor. is much more compact, and of less extent, but comprises a suburb of Wisbeach called New Walsoken, on the E. side of the river, excluded from the old bor., and has an area of about 1,200 acres, with a pop., in 1831, of 8,100. The central and main portion of the town lies in an angle between the Nene and Wisbeach canal: other streets extend for some distance N. and S. along both banks of the river, and along the canal, by which the town communicates with the Ouse in a S.E. direction. Most part of the houses on the E. side of the canal belong to the par. of Walsoken, in the co. of Norfolk: this suburb has been built within the last thirty years, and appears to be still extending. The inhabs. consist chiefly of the labouring classes employed in or connected with the interests of Wisbeach. (*Mun. Corp. and Bound. Reps.*) The town is irregularly laid out, but has, of late, been much improved: in its centre is a handsome crescent, erected in 1816 on ground formerly occupied by a castle founded soon after the Conquest. Most parts of the thoroughfares are well paved and lighted with gas. The par. church of St. Peter is a spacious but singular edifice, having two naves and two aisles. It exhibits a mixture of the Norman, Decorated, and Perpendicular styles. It has a fine tower, and has within several monuments of distinguished families, but is at the same time much encumbered with modern galleries. The living, a vicarage, to which the curacy of St. Mary's is attached, is one of the most valuable in this part of the country, being worth 1,779*l.* a year: it is in the gift of the Bishop of Ely. A chapel-of-ease has an endowment yielding 200*l.* a year; and the Baptists, Friends, Unitarians, Independents, and Wesleyans have their respective places of worship. The other principal buildings include a town-hall and custom-house, comprised in one building erected in 1804; a corn-exchange, assembly-rooms, and a theatre. Here, also, are some good libraries, and literary and other societies. The free grammar school, of ancient foundation, affords instruction to 30 boys, and has two exhibitions of about 70*l.* a year to

## WISCONSIN TERRITORY. 923

Magdalen College, Cambridge. Among the other educational establishments, are two charity-schools, partly supported by voluntary contributions, but chiefly by bequests; one for boys having an income of above 250*l.* a year, and one for girls, of above 220*l.* a year. There are 18 well-endowed almshouses, and the funds in the hands of the corporation for the support of schools, almshouses, apprenticing of children, loans, and the general relief of the poor, are said by the Commissioners of Charity Inquiry to have amounted to above 1,130*l.* a year.

Wisbeach has no staple manufacture; but it has an iron foundry, several yards for building and repairing vessels and boats, rope-walks, an extensive brewery, and several large malting establishments. The trade of the town is considerable, from its being the emporium of a considerable tract of country. The exports principally consist of corn, wool, rape-seed, and other products of the fens; and the imports of coal, timber, groceries, &c.

The trade of the port has been largely benefited by the great improvements that have been made, under acts passed in 1827 and 1829, in the course of the Nene from Wisbeach to its outfall in the Wash. These consisted principally in deepening and straightening the bed of the river, and in the drainage and embankment of the adjacent fens. This important work cost about 200,000*l.*, of which 30,000*l.* was contributed by the corporation of Wisbeach, who were at the same time authorised to levy increased port-dues (now 3*d.* per ton) on vessels frequenting the port. The latter may now be reached by a comparatively safe and speedy navigation, at spring tides, by vessels of 120 tons burden, and, at other times, by vessels of 60 tons. There belonged to the port, in 1841, 56 vessels of 50 tons and upwards, having an aggregate burden of 5,200 tons. The gross customs duty collected at this port, in 1840, amounted to 8,591*l.* The increase in the amount of shipping belonging to the port, which has nearly doubled since 1835, when the Nene Outfall was finished, and of the customs duties, shows the substantial advantages it has derived from that improvement.

"The town is apparently prosperous; its trade is extending, the value of property in the neighbourhood has increased, local taxation is stationary, and labour well paid. The inhabs. are said to be characterised by industry and prudence. Education among them is general, and few serious crimes are committed." (*Appendix to Munic. Corp. Report.*)

Wisbeach received its first charter of incorporation from Edw. VI., others being granted to it by James I. and Charles II. Under the Mun. Reform Act, it is divided into two wards, and governed by 6 aldermen and 18 councillors. The corp. revenue, which principally arises from harbour dues, exceeds 2,000*l.* a year. Wisbeach has no commission of the peace, petty sessions, and a court of record for the recovery of small debts; and assizes are held here annually. The ancient castle of Wisbeach was the royal episcopal palace of the bishops of Ely, but no traces of it now exist. A cattle-market was established here in 1810. Wisbeach has frequently suffered from inundations. Market-day, Saturday. Fairs five times yearly, chiefly for cattle, horses, hemp, and flax. (*Parl. Reps., art. BEDFORD LEVEL, in this work, and Private Information.*)

WISBY, a town of the island of Gottland, which see.

WISCONSIN TERRITORY, an extensive region of N. America, belonging to the United States, comprised between the 40th and 49th degrees of N. lat., and the 87th and 95th of W. long.; having N., Upper Canada; N.E. and E., Lake Superior, and the State and Lake of Michigan; S., Illinois and Missouri; and W., the great W. or Sioux territory, from which it is separated by the Missouri river. Its area may be loosely estimated at about 200,000 sq. m. Its pop., according to the census of 1840, was 30,345. It is a lofty table-land, broken by many hilly ridges, which, however, no where rise much above the general level. The N. part of this region abounds with lakes, giving rise to streams flowing N. into Hudson's Bay, W. into the great lakes of the St. Lawrence Basin, and S. to the Gulf of Mexico. The Mississippi and several of its considerable affluents, as the Chippeway, St. Croix, Wisconsin, &c., all rise in this territory; as do the case with the R. St. Louis, many most of the principal tributaries of the lakes Superior and Michigan, and the Red River, which pours its waters into the Winnipeg Lake. By far the greater portion of this vast region is inhabited only by wandering tribes of Indians. The portion of the E. part of the country, between the Mississippi, Wisconsin, and Fox Rivers, and Lake Michigan, with a narrow strip about 50 m. in length along the W. side of the Mississippi, comprising together about 26,000 m., is that over which the settlers are now dispersed. Wisconsin includes a part of the lead district of the U. States, conterminous with Illinois.

There are some bogs, wild rice swamps, and cranberry marshes in the S.E. cos. and there are also some sandy tracts; but a great proportion of the land in this part of the territory is of good quality, fertile, and easy of cultivation.

Between Rock River and Lake Michigan the surface is well wooded; but W. of the former the land is chiefly prairie, and there is a deficiency of timber. Green Bay affords a good harbour at the mouth of the Fox river, and here have sprung up the thriving villages of Green Bay, and Navarino. Prairie du Chien is a little village about 5 m. above the mouth of the Wisconsin. On the W. of the Mississippi the settlements are chiefly in the lead district in the N., and on the Des Moines in the S. The whole of this tract was ceded to the U. States in 1832, and is familiarly known as the Black-Hawk Purchase. It consists mostly of prairie, but as it abounds with fine lakes and running waters, skirted by pretty extensive woodlands, and as there are scattered patches of forest distributed over the prairies, there is no deficiency of timber, for building, fuel, and fencing. The soil is almost throughout rich and extremely easy of cultivation, and amply stored with lead, iron, and coal. Dubuque, on the Mississippi, has 10 or 12 smelting furnaces, a white lead factory, &c. Steam-boats run up here and to Prairie du Chien during a great part of the year. In the S. part of the Purchase, the principal town is Burlington. (*Encyc. of Geog.*, Amer. edit. lii. 684.) The gov. was organised in 1834. The Legislature Assembly consists of a council of 13 mems., elected for four years, and a House of Representatives of 26 mems., elected for two years. Their pay is 2 dols. a day, and 3 do. for every 20 m. travelling distance. Wisconsin is at present divided into 22 counties. Madison is the seat of gov., but Milwaukee, with a pop. of 1,712, is the largest town in 1840. (*Amer. Almanack*, 1842.)

WISMAR, a town and sea-port of N. Germany, in Mecklenburg-Schwerin, cap. lordship of its own name, at the bottom of a deep bay at the confluence of the Stör with the sea, 18 m. N. by E. Schwerin; lat. 53° 49' 22" N., long. 11° 36' 19" E. Pop. 11,000. The harbour, which is very extensive, is commodious and safe, being nearly land-locked by the islands of Poel and Wollin. Close to the town there is from 8 to 8½ ft. water; in the inner roads there is from 12 to 15 ft. and in the outer from 16 to 20 ft. water. The town is fortified, and has 6 churches, 3 hospitals, several schools, &c.; with manufactures of tobacco, playing cards, sail-cloth, and other fabrics, breweries and distilleries. Ship-building is also carried on to some extent; and Wismar is second in commercial importance to no town in the Grand Duchy but Rostock. The articles of import and export are the same as at Rostock (which see), but the trade of the town is more limited. It appears to have been founded in 1229, and afterwards became one of the Hanse towns. It has, however, generally belonged to Mecklenburg since 1648. (*Dict. Geog. and Com. Dict.*)

WISSEMBOURG, a town of France, dep. Bas-Rhin, cap. arrond., on the Lauter, on the Bavarian frontier, 33 m. N. by E. Strasburg. Pop. in 1836, 5,575. It is a fortified town, and some imports, as it commands a defile leading from the plain of the Rhine into the Vosges mountains, and is connected with a system of military works stretching along the course of the Lauter for some distance, called the lines of Wissembourg. It has an old collegiate church, built in 1248; a Protestant church, in which is a bust of Luther; barracks, &c.; and manufactures of hosiery, straw hats, soap and earthenware. It originated in an abbey founded here by Dagobert II. in the 7th century, and became a free town of the empire in 1297: it was annexed to France by the treaty of Ryswick. (*Hugo; Dict. Geog.*, &c.)

WITNEY, a market town and par. of England, co. Oxford, hund. Hampton; on the Windrush, a tributary of the Thames, 10 m. W. by N. Oxford. Area of par. 7,480 acres: pop. of ditto, in 1831, 5,336; of the town, 3,100. It is well-built and cheerful; the main street being on the High road between Burford and Woodstock. The town-hall, a stone building, has beneath it an area used for a market-place. Near it is the market cross, erected in 1682, and repaired by subscription in 1811; and in the High Street is the staple or blanket hall, a handsome stone edifice, built in 1721. The church, at the S. extremity of the principal street, is one of the handsomest in the co., being a large cruciform structure in the early English, Decorated, and Perpendicular styles, with a tower and lofty spire, ornamented with minarets. In the N. transept is a fine window; and within the building are several ancient monuments, and a handsomely carved and gilded burial chapel. The living, a very valuable rectory, being worth 1,200*l.* a year, is in the gift of the bishop of Winchester. Here, also, are places of worship for Wesleyans and Independents. The free grammar school, founded in 1660, for 30 boys, comprising a spacious school-room, library, and apartments for the master. Another free school, with a small endowment, was established in 1693. A school for the education, clothing, and apprenticeship of weavers' sons, was founded in 1782, and it has besides a national school and several almshouses.

Witney was long celebrated as a principal seat of the blanket manufacture; and, in the reign of Queen Anne,

the weavers of the town and adjacent district were incorporated into a company. But the trade has long been of very inferior importance, and the weavers' corporation has fallen into disuse. Since the peace especially, and the introduction of machinery into the business, blanket weaving has rapidly declined at Witney, and most part of the fabrics now sold as Witney blankets are, in fact, made in Glamorganshire, and elsewhere. Some rough coatings, tiltings for barges and waggons, and felting for paper-makers, are, however, made here; and in 1838, there were in the parish 5 woollen mills, employing 238 hands. (*Mills and Factories' Report*, &c.) The glove manufacture also employs a few hands; wool stapling is carried on to some extent, and the town has considerable trade in malt.

Witney was made a parl. bor. in the time of Edward II., but its privilege was withdrawn on the petition of the inhab. in the succeeding reign. It is governed by 2 bailiffs and 2 constables, chosen at the annual court leet; and a court baron, presided over by the Duke of Marlborough, is opened twice a year. Witney is of considerable antiquity, and its manor is stated to have been one of those given to the monastery of St. Swithin, Winchester. In the reign of Edward the Confessor, a market day, Thursday, fairs 5 times a year, for cattle and cheese. (*Revenues of England*, art. Oxford; *Lewis's Topog. Dict.*, &c.)

WITEPSK, or VITEBSK, a govern. of European Russia, principally between the 55th and 57th degs. of N. lat., and the 26th and 32d of E. long.; having N.E. the gov. of Pakof, S.E. Smolensk and Moghilef, S.W. Minak and Courland, and N.W. Riga. Area, 16,500 sq. m. Pop. in 1838, 717,700. Surface generally level, though on the banks of the rivers there are occasionally some low hills. Rivers and small lakes are numerous: of the former, which all flow towards the Baltic, the Dwina is the principal. Notwithstanding the soil is but of medium fertility, and agriculture is in a very backward state, more corn is produced than is required to supply the wants of the inhab. Hemp and flax are grown on a large scale, peas, beans, hops, fruits, &c. in the smaller inclosures. The forests are very extensive, 121,600 declinaies of forest land belonging to the crown. The grass lands are also extensive, and a good many horses and cattle are reared, though of inferior breeds. The sheep yield only coarse wool; and honey is, also, of inferior quality. The mineral products and manufactures are insignificant; the last being, with the exception of a few cloth factories, almost wholly restricted to distilleries and tanneries. The trade of the government is facilitated by the Dwina and the canal of Berezina: it is principally in the hands of the merchants of the principal towns, many of whom are Jews. This gov. is divided into 12 circles; of which towns, Witepsk, the cap., Wenzl, Dunaburg, and Polotsk. In 1832 it had 24 public schools, attended by about 1,100 pupils, besides three lycæums, and seven private schools.

WITTEPSK, a town of Russia, cap. of the above gov., on both banks of the Dwina, where it receives the Vitba, 330 m. S. by W. Petersburg. Pop. about 14,400. It is irregularly built, and is surrounded by old walls: it has numerous Greek and some R. Cath. churches, convents, and synagogues. Though by far the greater number of its houses be of wood, it has some dwellings of stone, a high school, a bazaar, an old castle, several hospitals, &c.; with manufactures of woollen cloths and tanneries. The Grand Duke Constantine, brother of the late and present emperor of Russia, died at Witpsk on the 27th June, 1832. (*Schmidler; Possart; &c.*)

WITTENBERG, a town of Prussian Saxony, formerly the cap. of the Electorate Saxony, now the cap. of a circ. of the reg. of Merseburg, on the Elbe, here crossed by a long wooden bridge, and on the road between Potsdam and Leipzig, 39 m. S.W. the former. Pop. 8,400. (*Berghaus*.) Though metamorphosed from the quiet seat of a university into a garrison and fortified town, Wittenberg has a peculiarly dull and melancholy aspect. It is, however, highly interesting, as the cradle of the Reformation; Luther and Melancthon having been professors in its university, and their remains being deposited in its cathedral. A statue of the great reformer in bronze, by Schadow, of Berlin, was erected in the market-place, in 1821. "It represents, in colossal proportions, the full length figure of Luther, supporting on his left hand the Bible, kept open by the right, pointing to a passage in the inspired volume. The pedestal on which the statue stands is formed of a solid block of red polished granite, 20 ft. in height, 10 ft. in width, and 8 ft. in depth. On each of its sides is a central tablet, bearing a poetical inscription, the import of the principal being that 'If the Reformation be God's work, it is imperishable; if the work of man, it will fall.' Over the figure is a very handsome light Gothic canopy, supported by 4 corner pillars, and surmounted by a filigree-pointed pinnacles. This canopy is beautifully cast in iron. Taken altogether, the monument is the most creditable piece of workmanship, and does honour to the present state of the arts in Prussia." (*Granville's Trav.*, i. 247-8.)

The graves of Luther and Melancthon in the cathedral are marked by two plain tablets. The altar-piece is by Lucas Cranach, a burgo-master of Wittenberg, the town-hall of which he has embellished with pictures of Luther and of the subjects of the Ten Commandments. It was against the walls of this church that Luther suspended his 95 theses against papal indulgences; and outside the E. gate of the town he publicly burned the bull for his excommunication. Luther's apartment in the old Augustine convent remains in much the same state as in his time; and the autograph of Peter the Great on the wall is preserved by a glass covering. Wittenberg, having ceased to be a capital, was found inadequate to the support of its university, which was accordingly removed to Halle. It still has, however, a gymnasium, an ecclesiastical seminary, &c., and is the seat of a board of taxation and of the usual circle courts. From its situation on the Elbe, in a fertile country, with both iron and coal in its neighbourhood, it possesses great commercial advantages; but its trade is insignificant, and it has only a few manufactures of linen and woollen goods.

It has frequently suffered from sieges, particularly in 1756, and in 1814, when it was taken by storm from the French. (*Dict. Géog. Hodgskin, Trav. in the N. of Germany; Strang, &c.*)

WOBURN, a market town and par. of England, co. Bedford, hund. Manshead, on the great N. road, 38 m. N.N.W. London. Area of par., 3,200 acres. Pop., in 1830, 1,827. The town consists of a main street, about 1.3d m. in length, with the market-cross nearly in its centre; and having been nearly burnt down in 1724, it is comparatively well laid out and well built. The market-house, a handsome edifice, originally erected by the Bedford family, was rebuilt at their expense, by Blore, in 1830. The same artist has, also, restored the church, an edifice in the perpendicular style, built by the last abbot of Woburn, having a tower detached from its main body. In the chancel is, among others, a curious monument to Sir F. Staunton and his family. The living, a curacy, in the gift of the duke of Bedford, is worth 25*l.* a year. The free-school, founded by the Earl of Bedford in 1582, has an income of 50*l.* a year, and furnishes instruction to 150 boys on the Lancastrian plan. Almshouses, founded in 1672 for 24 widows, have an income of 30*l.* a year, and there are several minor charities. Petty sessions monthly, and manorial courts occasionally, are held in Woburn. The inhabs. are either occupied in lace-making and straw-plaiting or are employed by the Bedford family. Markets on Fridays; fairs four times yearly for farm stock.

Immediately E. of the town is Woburn Park, with Woburn Abbey, the principal seat of the Duke of Bedford. It derives its name from its occupying the site of a Cistercian abbey, founded here in 1145, and granted to the Russell family in the time of Edw. VI. The present mansion, which was built about 1745, has since been greatly improved and enlarged. It is a quadrangular edifice, its principal W. front being of the Ionic order, with a rustle basement. The interior of this noble pile is splendidly fitted up, and many of the apartments are enriched with valuable paintings, both by the old masters and British artists. The drawing room, thence called Venetian, has a fine series of 24 views in Venice, by Canaletto. In the hall is an anc. Mosaic pavement, brought from Rome. A sculpture gallery, 138 ft. in length by 25 ft. in breadth, with a flat dome in its centre supported by 8 antique marble columns, has a fine collection of antique marbles, including the famous Lanti Vase, of Parian marble, 6 ft. 3 in. in diameter, and 6 ft. in height, exclusive of the plinth on which it stands. It is of the lotus form, has two magnificent handles, and is beautifully sculptured. This admirable specimen of ancient art was found among the ruins of Hadrian's Villa at Tivoli, of which it had no doubt formed a principal ornament. Here, also, is a fine cast of the Apollo Belvidere. Westmacott's statue of Psyche, &c. In the W. wing of the edifice is the Temple of the Graces, erected in 1748, to receive Canova's magnificent group of the Graces, placed on a circular pedestal in the centre. The library is both extensive and valuable; and at one of its extremities is a room appropriated to Etruscan antiquities. The stables, riding-house, tennis-court, &c., are in a detached building, connected with the mansion by a colonnade,  $\frac{1}{2}$  m. in length. The greenhouse, designed by Sir J. Wyatt, is a handsome building 140 ft. in length, and in which, with a great variety of valuable plants, are some fine statues. The park, 12 m. in circuit, surrounded by a wall 8 ft. in height, is beautifully diversified, abounding in wood and water, and well stocked with deer. (*Parl. Rep.; Railway Handbook, &c.*)

WOKINGHAM or OAKINGHAM, a market-town and par. of England, co. Berks, hund. Sonning, on the confines of Windsor Forest, 64 m. S. E. Reading. Area of par., 8,450 acres. Pop., in 1831, 3,139. The town consists of several streets, meeting in a central market-place, in which is the market-house and town-hall. The

church, in the perpendicular style, is a fine old edifice. The living, a perpetual curacy, worth 126*l.* a year, is in the gift of — Jacob, Esq. The Wesleyans, Baptists, &c. have meeting-houses here; and, besides Sunday schools, there is a free school, with an income of above 45*l.* a year, at which between 30 and 40 boys are instructed on the Madras system. The aggregate income of the various charities in Wokingham amounts to nearly 530*l.* a year. (*Digest of Charity Reps.*)

About 1 m. from the town is a hospital, under the direction of the Governors' Company, London, founded in 1665, for 16 poor men and a master. The inhabs. of Wokingham are employed principally in weaving silk stuffs and gauzes, and in making shoes. The town was incorporated by Jas. I., and is governed by an alderman, recorder, 7 burgesses, and other officers, chosen on Easter Wednesday, who hold petty sessions and some other courts. Formerly all the courts for Windsor Forest were held at Wokingham. Markets, Tuesday, fairs, April 23., June 17., Oct. 11., and Nov. 2., for horses and cattle. (*Parl. Reps., &c.*)

WOLFENBÜTTEL, a town of Germany, duchy of Brunswick, cap. circ., on the Ocker, 8 m. S. Brunswick, Pop., 8,550. It was formerly fortified, but its defences are now in a ruinous state. It is master of the city, or town-proper, called Heinrichstadt, and the quarters or suburbs of Augustustadt and Gotteslager. It is well-built; and its streets, which are broad and regular, are paved and watered by branches of the Ocker. It has several churches worthy of notice; and a magnificent ducal library, comprising not less than 190,000 vols. It includes a large collection of bibles, among which is the one that belonged to Luther, with autograph notes: His marriage ring, doctor's ring, spoon, drinking-glass, and one of his many portraits by L. Cranach are also preserved here. (*Murray's Handb.*) The old castle of the lords of Wolfenbittel has been converted into a prison, and the ducal castle now serves for a factory. It has a large workhouse, hospital-orphan asylum, gymnasium, and several city schools; and is the seat of the superior court of appeal for the states of Brunswick, Waldeck, and Lippe, and of several subordinate courts. It has manufactures of lacquered and japanned wares, paper hangings, leather, tobacco, &c.; with some trade in corn and linen yarn, and 5 annual fairs. Its neighbourhood is fertile, but marshy and unhealthy. (*Berghaus; Dict. Géog.*)

WOLGA or VOLGA (an. *Rha*), the largest river of Europe, through the E. part of which it flows; its basin comprising the central part of European Russia, has the basin of the Dvina to the N., of the Don and Dnieper to the S., and of the Oural, to the E. The Wolga was formerly considered as constituting a part of the boundary-line between Europe and Asia; but since the limits of these continents have been removed to the Caucasus and the Caspian, its basin, with those of its tributaries, lie wholly within Europe. From its source to its mouth its length is estimated at about 2,000 m., being about 200 m. longer than the Danube. The area of its basin has been supposed to include upwards of 636,000 sq. m., or considerably more than twice as much as the basin of the Danube, and eight times as much as that of the Rhine. (*Müller, Stromgese der Wolga, 79.*)

The Wolga has its source in a small lake at the W. extremity of the gov. Tver, in lat. 57° 10' N., long. 32° 20' E., 220 m. S.S.E. Petersburg; on the E. declivity of the Valdai plateau, near the source of the S. Dvina, the Dnieper, and other large rivers, at an elevation of 895 ft. above the level of the sea. (*Müller, 113.*) It flows at first S.E., and afterwards N.E. through the gov. of Tver and Jaroslavl; at Mologa it turns to the E.S.E., which direction it generally pursues through Jaroslavl, Kostroma, Nijni Novgorod, and Kazan to the confluence of the Kama, about lat. 55° 8', and long. 49° 30'. Thenceforward it runs generally S.S.W. through the gov. of Simbirsk and Saratof to Tzaritzin, where it approaches within 32 m. of the main stream of the Don, their confluence being prevented by an intervening chain of hills.

It then turns again to the S.E. through the gov. Astrakhan, and pours itself into the Caspian, on its N.W. side, through an extensive delta by more than 70 mouths, the W. and largest of these being in lat. 46° N., and long. 48° E. Throughout its long course it waters, with its tributaries, some of the most productive portions of European Russia and the region which was anciently the nucleus of the Russian monarchy. Tver, Jaroslavl, Kostroma, Nijni Novgorod, Simbirsk, Saratof, Astrakhan, and several other towns are situated on the Wolga; and Kazan is on one of its tributaries within a short distance of the main stream.

The principal affluents of the Wolga are the Tvertza, Mologa, Shekuna, Unja, Vetluga, and Kama, from the N. and E., and the Oka and Sura from the W. and S. The Kama, which is by far the largest, is, also, the last tributary of any consequence which it receives. It rises in the gov. of Viatka, about lat. 58° N., long. 53° E., and flows with a very tortuous course, at first

## VOLGA.

...but afterwards in general S. of Perm and Kasan, and beyond the mouth of the Volga. After a course of from 130,000 to 150,000 paces, it can now only convey cargoes of about 50,000 pounds; and in the portion of its course now referred to, it is navigated with difficulty even by the two-masted vessels of Astrakhan. (Müller, *Das Stromsystem der Wolga; Berghaus; Stein's Hand-book der Geog.; Dict. Géog.*, &c.)

WOLFSINGHAM, or WALSINGHAM, a market town and par. of England, co. Durham, Darlington ward, on the Wear, 12½ m. W.S.W. Durham. Area of par., 24,780 acres. Pop. in 1831, 2,239. The town is pleasantly situated, but irregularly built. The church is an ancient structure, with a beautiful font of Wear-dale marble. The living, a valuable rectory worth 791*l.* a year net, is in the gift of the Bishop of Durham. The remains of an old manor-house, belonging to the former bishops, and enclosed by a moat, are near the church. The grammar-school, founded in 1612, with an income of above 65*l.* a year, besides 30 pay scholars, supplies gratis instruction to 26 boys, in reading, writing, arithmetic, and the classics. Here, also, are several other schools, and endowments for the poor not receiving parochial relief. The inhabs. are principally employed in the manufacture of linen and woollen cloths, tools and agricultural implements; or in the coal, lead, and limestone works in the vicinity. Petty sessions are held weekly; and a court-leet twice a year, at which debts of 40*s.* are recoverable. Markets on Tuesdays: fairs, May 12 and Oct. 2.

From its abounding with islands, particularly in the lower part of its course, the breadth of the Volga is very variable. At Tver, however, it is nearly 600 feet in breadth; at Nijni Novgorod, after it has received the Oka, about a verst, or 1,200 ft.; and at Astrakhan it is usually 1½ m. across. But this is not the case during the entire year, for, on the melting of the ice and snow in spring, it is subject to great risings, and inundates large tracts of the surrounding country. The rise begins in April; its height varies greatly in different places, but is greatest in the middle portion of the river's course. At Tver the total rise is about 12 ft. above its summer level; at Jaroslavl and Nijni Novgorod 18 or 20; at Kasan 25 or 30; and at Saratof from 30 to 40 ft. But downwards beyond this point, after which the Volga receives no affluent of any consequence, and its bed becomes more capacious; the height of its rise gradually diminishes, being at Tzaritzin from 25 to 30 ft., and at Astrakhan only from 6 to 8, or seldom so high as 12 ft. The time of subsidence also varies considerably in different parts: at Nijni Novgorod the river is commonly confined again within its bed by the beginning of June; at Kasan not till the middle of the same month; and at Astrakhan it does not diminish to its ordinary height till after the summer solstice. According to recent discoveries, the surface of the Caspian is 101 ft. below the level of the Black Sea, which would give to the Volga (estimating its course at 2,000 m.) an average descent of about 5·4 inches per mille: from the junction of the Kasan with the Volga, the fall of the latter, Humboldt says, is greater than that of either the Amazon or the Nile, and almost as great as that of the Oder. (See *Geog. Journ.*, viii. 125.) Though rather a rapid river (*Pallas*, i. 25.), yet, as it runs through a flat country, with an immense volume of water, in a bed unbroken by cataracts, though not free from sand-banks, it is navigable for flat-bottomed boats nearly to its source. Not far below this point it is connected by a canal with the S. Dwina, establishing a direct water communication between the Caspian and the Baltic. The Transvolga Canal, in the gov. of Tula, (which unites the Ugra, a tributary of the Oka, with the Don), opens a communication between the Caspian and the Black Sea; and, by means of the Vichnei Volotchok Canal, between the Msta and Tvertza rivers, and the canal between the Sestra and Istra, in the gov. of Moscow, Petersburg and Moscow are directly connected. Other canals connect the basin of the Volga with that of the N. Dwina, the Lake Onega, &c.; and nowhere else has so extensive a system of inland navigation been effected by artificial means, with so little labour. This navigation is, however, suspended by the frost for at least 160 days each year.

Though the situation of the Volga, remote from the great marts of Europe, Asia, and Africa, with its embouchure in the Caspian, renders it of much less commercial importance than it would be under other circumstances, it is still the main artery of Russia, and the grand route of the internal traffic of that empire. It has been estimated that in the first thirty years of the present century, from 600 to 700 vessels a year came down the Volga to Astrakhan, while from 300 to 400 sailed from that port to others on the upper course of the river. Unfortunately, it would seem as if the Volga had been for some considerable period decreasing in depth; and it is said that of late years sand-banks have accumulated

## WOLVERHAMPTON.

so much, particularly between Nijni Novgorod and Kasan, that the vessels laden with salt from Perm, which in the early part of last century used to bring cargoes of from 130,000 to 150,000 pounds, can now only convey cargoes of about 50,000 pounds; and in the portion of its course now referred to, it is navigated with difficulty even by the two-masted vessels of Astrakhan. (Müller, *Das Stromsystem der Wolga; Berghaus; Stein's Hand-book der Geog.; Dict. Géog.*, &c.)

WOLFSINGHAM, or WALSINGHAM, a market town and par. of England, co. Durham, Darlington ward, on the Wear, 12½ m. W.S.W. Durham. Area of par., 24,780 acres. Pop. in 1831, 2,239. The town is pleasantly situated, but irregularly built. The church is an ancient structure, with a beautiful font of Wear-dale marble. The living, a valuable rectory worth 791*l.* a year net, is in the gift of the Bishop of Durham. The remains of an old manor-house, belonging to the former bishops, and enclosed by a moat, are near the church. The grammar-school, founded in 1612, with an income of above 65*l.* a year, besides 30 pay scholars, supplies gratis instruction to 26 boys, in reading, writing, arithmetic, and the classics. Here, also, are several other schools, and endowments for the poor not receiving parochial relief. The inhabs. are principally employed in the manufacture of linen and woollen cloths, tools and agricultural implements; or in the coal, lead, and limestone works in the vicinity. Petty sessions are held weekly; and a court-leet twice a year, at which debts of 40*s.* are recoverable. Markets on Tuesdays: fairs, May 12 and Oct. 2.

WOLVERHAMPTON, a parl. bor., market-town, and par. of England, co. Stafford, hund. Seisdon, in one of the principal iron manufacturing districts, and at the junction of six principal roads, 13 m. N.W. Birmingham. The par., which is of great extent, comprises 5 townships, 4 of which, including the towns of Bilston and Willenhall, with the adjoining par. of Sedgely, are included in the parl. bor.; the area of which amounts to 16,630 acres. Pop. of do., in 1831, 67,514, of whom 24,732 of do. belonged to Wolverhampton township. Pop. of the latter, in 1841, 36,189. Wolverhampton stands on an eminence commanding fine views of the surrounding country, and though irregularly laid out, is not ill-built; but, from the many furnaces and forges in the town and neighbourhood it has a blackened appearance. There are some good modern residences in the suburbs. Four of the principal streets diverge from the market-place. The town is well lighted, partially paved, and supplied with water from wells sunk in the rock on which it is built. The collegiate church of St. Peter, on the most elevated position in the town, is a large cruciform structure, chiefly in the perpendicular, but partly, also, in the decorated and early English styles. It has a tower, the upper part of which is late perpendicular, and a much finer composition than the other portions of the church. The chancel is modern; the nave has a rich stone pulpit, and in the churchyard is a rudely sculptured cross, much defaced by time. (*Rickman*.) This church was formerly considered one of the king's free chapels, and was attached, by Edward IV., to the deanery of Windsor. The living, a vicarage worth 193*l.* a year, is in the gift of the Dean of Windsor. St. John's church, a handsome stone edifice, on the S. side of the town, erected by subscription, in 1761, is a curacy worth 200*l.* a year, in the gift of the Earl of Stamford. St. George's, a building, of Grecian architecture, and St. Paul's, a Gothic structure, are comparatively recent, and 2 other churches are now (1842) in the course of being erected. Besides a Rom. Cath. chapel, there are several Dissenting meeting-houses, to all of which, as well as to the church, are attached Sunday-schools are attached. The free grammar-school, founded by Sir Stephen Jennings, a native of the town, who was lord mayor of London, in 1658, has an endowment yielding about 1,200*l.* a year. It is managed by 40 trustees, who allow the head master 500*l.* a year. It is open to all boys of the par., and is, at present, (1842) attended by about 140 pupils. Sir W. Congreve and Abernethy, the surgeon, were educated at this school. Besides a blue-coat charity, for 36 boys and 30 girls, of very ancient foundation, with an income of 240*l.* a year, there are national and British schools; and considerable funds exist for distribution among the poor. A dispensary was established, in 1821, for which an eligible building was erected in 1825, and, in 1813, a union-mill, for grinding corn for the poor at a cheap rate, was built by shares at a cost of 14,000*l.* Wolverhampton has also a public news-room with an extensive library, assembly and concert-rooms, and mechanics' institute. W. of the town is a fine race-course, with a grand stand, where races take place annually in August. Two weekly newspapers are published in the town. Most departments of the hardware manufacture, excepting cutlery, are carried on here and in the adjacent town of Bilston and the district. Wolverhampton has been long celebrated for her locks, of which she almost exclusively engrossed the manufacture down to a

## WOODBRIDGE.

comparatively late period. At present, however, the most expensive and best locks are made in the metropolis, and the lock trade is also carried on in Birmingham; but this town still enjoys the largest share of the business. Probably, however, the manufacture of japanned ware and tinned plates may be regarded as her staple business; and in addition she furnishes carpenters' tools, files, screws, hinges, steel mills, machinery, &c. Immense quantities of nails are made in the surrounding villages.

Wolverhampton, Bilston, and the other places within the limits of the par. bor., are wholly indebted for their rapid rise and large pop. to the facilities they enjoy for carrying on the iron trade. In the vicinity are all but inexhaustible mines of coal and ironstone, the main bed of coal being 30 ft. thick, with strata of ironstone above and below! The district has also the farther advantage of being connected by numerous canals, with all the great shipping ports of the empire. Under such circumstances, we need not be surprised at the rapid progress it has made since 1772, when there was only one blast furnace at Bilston! whereas, in 1842, there are in the par. bor. no fewer than 55 blast furnaces, capable of producing more than 4,000 tons of iron a week! Indeed, the whole country to the S. and E. of the town is covered with furnaces, forges, rolling mills, foundries, ironstone and coal pits; and though the trade be at present (1842) much depressed, there being about 24 furnaces out of blast, the advantages enjoyed by the district are such as can hardly fail to insure its prosperity.

The Grand Junction Railway has a station 1 m. E. of the town, and here the line attains its greatest elevation of 440 ft. above the sea level. The Birmingham, Staffordshire and Worcestershire, and Birmingham and Liverpool canals, unite about 1 m. N. from the town, affording, as already stated, a ready communication with all parts of the kingdom. The Wolverhampton and Staffordshire Banking Company, established in 1831, has its office in this town.

The town is under the jurisdiction of the co. magistrates, but is locally governed by two constables and other officers, chosen at an annual manorial court. Petty sessions for the hund. are held here, and a court of requests monthly for debts under 5*l*.

The Reform Act conferred on Wolverhampton, Bilston, and the district included within the par. bor., the important privilege of sending 2 mems. to the H. of C. Reg. electors, in 1839-40, 2,643.

The new poor law was introduced here in 1836, when the townships of W. Hampton, Bilston, Willenhall, and Wodnesfield were formed into the "W. Hampton Union." The pop. of these townships amounted, in 1831, to 46,931; and in 1841, to 68,189. A superior and spacious "Union house" has been lately erected.

Though of great antiquity, the earliest records of Wolverhampton date only from the end of the 10th century, when Wulfrauna, duchess of Northampton, founded a monastery here, of which, however, there are now no remains. A fire, which continued for five days, destroyed the greater part of the town in 1590.

Market days, Wednesday and Saturday; fairs, July 10th, 11th, and 12th, for cattle and various merchandise. (*Part. Rep. ; Priv. Inf.*)

WOODBRIDGE, a market town, par., and river-port of England, co. Suffolk, on the Deben, 8 m. from the sea, and 74 m. E.N.E. Ipswich. Area of par. 1,650 acres. Pop. of do., in 1831, 4,763. The town is on the slope of a hill, and consists of two principal streets, an open space called Market Hill, and some narrow thoroughfares: it has many good houses, and is tolerably well paved and lighted. In the centre of the Market Hill is the sessions house, a brick edifice, in the lower part of which the corn market is held. The church, a noble edifice, said to date from the time of Edw. III., consists of a nave, chancel, and two side aisles, the roofs of which are supported by 14 fine slender pillars; its outer walls are constructed of black flints, and it has a square tower 108 ft. in height. On its S. side was anciently an Augustinian priory, founded by one of the Rous family in the 12th century. The living, a perpetual curacy, worth 439*l*. a year, is in the gift of the Rev. T. Salmon. Here, also, is a free grammar school for 10 boys, sons of the poorer inhab. of the town, who are to be instructed in Latin and Greek, and fitted for the university; with national, Lancastrian, and Sunday schools. Almshouses for 12 poor men and 3 women, founded and endowed in 1587, had, in 1825, an income of 570*l*. a year; but as this income was derived from a lease of property in Clerkenwell, in the city of London, entered into about 60 years previously, and then about to expire, it is now probably much greater. The income of the town lands is chiefly applied to parochial repairs, &c. A small theatre was erected in 1813.

Woodbridge is a member of the port of Yarmouth, and the Deben being navigable thus far, for vessels of 120 tons, it has a considerable trade with London, Hull, Newcastle, &c., exporting corn, flour, and malt, and im-

## WOODSTOCK.

287

porting coal, timber, wines, spirits, groceries, &c. It has several docks for the building of vessels, and convenient wharfs and quays. Woodstock is governed by a visitor and two guardians, chosen by the electors. Quarter sessions for the liberty of St. Edmund are held six adjacent hundreds are held here, and petty sessions weekly. Market days, Wednesday, Friday, April 5, 12th, Oct. 31, for cattle.

WOODSTOCK (NEW), a par. and market town, and market town of England, co. Oxford, situated in Woodstock, par. of Bladon, on the small river Uffington, which supplies the magnificent piece of water in Blenheim Park, 3 m. N.N.W. Oxford. The old par. bor. included only a portion of the town; but the modern par. bor. includes the whole of the latter, with a district extending about 4 m. on every side, comprising several adjacent villages and hamlets, and having an area of 21,640 acres, and a pop., in 1831, of 7,855. This is a clean, well built, country town; the streets are well paved, and well kept, and many of the houses, which are mostly of stone, are of a superior class; but it has, notwithstanding, a dull and inanimated appearance, and is not prosperous. The church is a handsome structure, partly rebuilt in 1785, when a tower was added to its W. extremity. The living is a curacy annexed to the rectory of Bladon, worth 320*l*. a year, and in the gift of the Duke of Marlborough. Here, also, are places of worship for Baptists and Wesleyans. The town hall, erected in 1766, at the expense of the then Duke of Marlborough, has under it the market place. A free grammar school, founded in 1555, affords instruction to about 20 boys; but the endowment for its support is small, and the master's salary of 30*l*. a year, is partly made up by the corporation; it has, besides, an endowed school, with an income of 75*l*. a year, in which 24 children are educated, partially clothed, and apprenticed, with alms-houses for widows, and several minor charities.

Woodstock had formerly a considerable manufacture of polished steel articles, much esteemed for their delicate workmanship; but this business is now nearly or wholly extinct. The manufacture of doe-skin gloves, which was introduced at a later date, is now almost the only branch of industry carried on in the town. In 1835, upwards of 1,200 hands, mostly women and girls, were employed in this manufacture in Woodstock and its vicinity, who were supposed to produce about 500 pairs of gloves per week. But this branch has, also, declined in the interval, principally, as is understood, in consequence of the substitution of thread and cotton for leather gloves; and in consequence of this decline, and of the embarrassed situation of the Marlborough family, the prosperity and population of the town have both fallen off.

The bor. received its present charter of incorporation from Henry VI.; but that by which it has been latterly governed dates from the 16th of Charles II., the corporate body, consisting of a mayor, 4 other aldermen, a high steward, recorder, and other officers. The annual court leet or sessions, granted to the bor. by charter, has been discontinued since 1829; but petty sessions, and a court of record are opened monthly. The bor. has no gaol, but a small lock-up house.

Woodstock was a bor. by prescription previously to its incorporation, and returned 2 mems. to the H. of C. from the 13th of Elizabeth down to the passing of the Reform Act, which deprived it of 1 mem., at the same time that the boundary of the par. bor. was altered, as already stated. Previously to the Reform Act the franchise was vested in the mayor, aldermen, and freemen of the bor.; but substantially, and in fact, it was a nomination bor., belonging to the Duke of Marlborough. Reg. electors, in 1839-40, 369. Market day, Tuesday; fairs, seven times a year, chiefly for cattle, horses, cheese, and hardware.

Old Woodstock stood in a low situation a little N. of the town, on the Glyme, and has now only a few houses and one ancient mansion. Woodstock was long a royal residence. A palace, or manor-house, on the N. bank of the Glyme, was the residence of Henry II., and the scene of some of the adventures of the fair Rosamond; but all traces of this building have long since disappeared. Edward I. held, in 1275, a parliament at Woodstock; and it was also the birth-place of his second son Edmund, and of the eldest son of Edward III., the illustrious Black Prince. It was subsequently inhabited by several of our monarchs; and Elizabeth was for a while imprisoned here. But every part of this more recent palace has also been pulled down.

Chaucer, the great improver of the English language and versification, is supposed by many to have been a native of Woodstock; where, it is alleged, he first saw the light in 1328. At all events he frequently resided in the town; and some traces still exist of the house which he occupied.

At present Woodstock derives its whole importance from its being in the immediate vicinity of Blenheim

Palace and Park, the seat of the Duke of Marlborough. In previously noticing this noble seat (see *BLANCHETON PARK*, Vol. I.) we omitted to notice the library, originally intended for a picture gallery, and one of the finest apartments in England. It extends along the whole of the W. front, being 133 ft. in length, and beautifully proportioned. It contains the Sunderland collection of books, comprising 17,000 vols.; and a fine statue of Queen Anne by Rysbrack. In the chapel is a splendid monument, by the same sculptor, in honour of the great Duke of Marlborough and his Duchess. (*Bound. Rep.*; *Music. Corp. Append.*; *Private Information.*)

**WOOLER** a market town and par. of England, co. Northumberland, Glendale ward, on the E. declivity of the Cheviot hills, 42 m. N.N.W. Newcastle. Area of par. 4,620 acres. Pop. in 1831, 1,926. The town is of high antiquity, and at one period was a good deal resorted to by invalids. It consists of several streets branching from the market-place, and has a public library, mechanics' institute, dispensary, and many dissenting places of worship. The church is a new but plain building, erected about the middle of last century; the living, a vicarage worth 478*l.* a year, is in the gift of the Bishop of Durham. A free school, with a small endowment, is the only charity mentioned as existing here. Courts leet and baron are held annually by the lord of the manor. In the neighbourhood are the vestiges of ancient encampments. At Homildon, about 2 m. from the town is a pillar, erected to commemorate the total defeat, in 1402, of an army of 12,000 Scotchmen, under Earl Douglas, by the forces of the Earls Percy and March. Markets on Thursdays; fairs, May 4th, Oct. 27th, and Whit Tuesday.

**WOOLWICH**, a pari. bor., market, and sea-port town of England, co. Kent, on the S. bank of the Thames, 7 m. E. London, and 24 m. E. Greenwich. Pop. in 1831, 17,661. The older parts of the town, near the river, have narrow streets, and are mean, dirty, and badly built, with but little prospect of being much improved; but in the more modern portions, and especially between the old town and the barracks, the streets and houses are of an improved and far more respectable description. Woolwich, however, derives its entire importance from its dock-yard, arsenal, and other great naval and military establishments; and is principally inhabited by individuals dependent upon or connected with them. The church in a conspicuous situation, with a tower at the W. end, was rebuilt towards the middle of the last century. The living, a valuable rectory, worth 740*l.* a-year nett, is in the gift of the Bishop of Rochester. Besides the church, Woolwich has an Ordnance chapel on the road to Plumstead, a chapel in the barracks, a proprietary episcopal church near the arsenal, a Scotch church, and various meeting-houses for different classes of dissenters. The charitable institutions comprise an almshouse for 5 poor widows, endowed, in 1560, by Sir Martin Bowes, Lord mayor of London, and two charity schools, one for 30 girls, and one for educating, clothing, and apprenticing poor orphan boys, sons of such shipwrights as have served their apprenticeship in the dock-yard; and national and other public schools have been established, in which about 900 children are daily instructed, exclusive of the Sunday schools attached to the parish church and the dissenting chapels, where upwards of 2,000 children are taught. Among the places of amusement is a small theatre. A mineral spring on the N. of the common possesses valuable medicinal properties.

**Dock-yard.**—This, though not the most extensive, is the most ancient royal dock-yard in the kingdom. Some uncertainty exists as to the precise date, but it is believed to have been established as early as 1512; and it is certain that it was placed upon a permanent footing in the latter part of the reign of Henry VIII. It presents a frontage to the river of nearly 4,000 ft., but is of irregular breadth. It has been, of late years, greatly improved and extended, and contains at present about 55 acres; but it is in contemplation to increase it to about 63 acres. It has 6 building slips: 2 for first-rates, 2 for line-of-battle ships of inferior size, and 2 for smaller ships.

Although some very large ships have been built in this dock-yard at different periods, such as the Royal George (lost at Spithead), the Nelson in 1814, and the Trafalgar in 1841, yet considerable disadvantages are felt in the constructing of such ships from the shallowness of the water and the accumulation of mud in the river; and it has, in consequence, been determined to build the largest class of men-of-war in the other dock-yards, and to make this the principal yard for steam ships belonging to the royal navy. With this intention a factory was built in 1839, consisting of 2 ranges of handsome and substantial buildings, each 410 feet in length by 35 in breadth, for the manufacture of steam-engines and boilers. The factory contains a foundry and forges, with fan-blowing machines for the furnaces, and a variety of machines for punching, shearing, plate-bending, drilling, boring, planing, turning, shaping, bolt-screwing, &c. &c. The machinery has been made by

the most eminent manufacturers in the kingdom, and embodies the result of all the improvements of the last twenty years in a careful selection and adaptation reflecting infinitely credit on the chief engineer.

The moving power of the factory is a steam-engine of 30 horse-power. Another building is to be immediately erected, at an expense of 14,000*l.*, 232 ft. in length by 65 ft. in breadth, with a chimney 100 ft. in height, into which all the flues of the factory will be led. This addition will give the means of doubling the work performed, and will, it is expected, enable the Admiralty to furnish the whole of the steam-ships with the necessary machinery.

There is at present an outer basin, comprising an area of 120,000 sq. ft., in which ten or a dozen steam-ships of different sizes may conveniently lie. An inner basin of 100,000 sq. ft. area, on the site of the Mast Pond, is also in a forward state of construction, and when completed will allow two first-class steam-ships to lie alongside the factory and be simultaneously fitted with their engines, boilers, and other machinery. A magnificent dock, entirely composed of massive blocks of granite, has lately been built, capable of receiving a 120-gun ship; a second is nearly completed, and it is proposed to construct two similar docks for steam-ships, making four in all.

The smithery, constructed by the late Mr. Rennie, is on a very grand scale, and is suitable for the forging of the largest anchors, and other heavy articles. It contains 37 forges, with 2 lift hammers weighing 4½ tons each, and 3 tilt hammers of 18 cwt. each; there are also 3 air and 2 blast furnaces, with a blasting apparatus of a very scientific description. There are two steam engines in the smithery, one of 20 and another of 14 horse-power. The anchors are tested by a powerful hydraulic machine, made by Bramah, capable of applying a pressure of 100 tons. The pitch and tar vault is constructed so as to admit of its easy inundation in case of fire. The ships now (1842) building are the Royal Albert, 120; Boscawen, 70; Chichester, 50; Amphion, 36 guns; with 2 steam-ships. Frames are in preparation for the Harbinger of 90 guns, a brig, and 2 steam-ships.

The number of workmen of all kinds employed amounts at present (1842) to 1,300, exclusive of about 700 convicts, landed daily from the Warrior hulk, moored off the yard, who are generally employed in the most laborious occupations.

The mast houses, mast slip, mast ponds, warehouses, &c., are all on a very extensive scale, and the whole is thoroughly organised and in the most efficient state. A large ropery was formerly attached to the dock-yard, but, its situation not admitting of the introduction of machinery, it has been abandoned, the buildings removed, and the site built upon.

**Arsenal.**—Woolwich is the head-quarters of the Ordnance military corps, viz., the Royal Horse and Foot Artillery, the Royal Sappers and Miners, &c.; and it is also the principal establishment in the kingdom for the provision of warlike materiel for the navy and army. The Royal Arsenal, formerly called the Warren, admirably situated on the E. side of the town, appears to have been used as a gun-wharf and powder magazine from about the middle of the 17th century; but it was not until the removal of the foundry from Moorfields, in 1720, that it began to assume the importance it has since attained. It comprises within its boundaries about 110 acres, or, including a part of the Plumstead marshes, used as a review and practising ground, from which it is separated by a canal communicating with the Thames, it may extend over nearly 300 acres. The following are the principal departments into which it is divided:—1st. The *Royal Brass Foundry*, erected by Sir John Vanbrugh in 1719, on a site chosen by a young Swiss named Schach, under whose direction the foundry had been placed on its removal from London. In it are now cast all the brass ordnance used in the service. It contains 3 furnaces, the largest capable of melting 16 tons of metal, sufficient for about twelve 24-pounders; with accommodation for making moulds, boring, turning, and polishing the guns. Iron guns are also bored up from smaller to larger calibres; these, however, are not made by the Board of Ordnance, but are supplied by private manufacturers. In 1809, 385 guns were cast in the foundry, which appears to be the highest number cast in one year. The statue for the Duke of York's monument was cast here. Horse power has hitherto been used, but a steam-engine of 12 horse-power has recently been erected. In this department, which is under the inspector of artillery, all guns are proved before being used.

2nd. The *Royal Laboratory*, in which every kind of ammunition, viz. ball and blank cartridge, &c., is made up; Congreve and other rockets, grenades and fireworks manufactured; shells and spherical case-shot, or Shrapnell shells, filled, &c. A machine, invented by Napier, for making musket and pistol balls by compression, had been lately introduced, which acts with great ease and rapidity, and seems to be far preferable to the old mode of casting. Percussion caps for the service have also,

within the last two years, been entirely made in the laboratory; the portion of the apparatus designed for filling and finishing the caps is exceedingly ingenious, and performs its work with great rapidity and safety, one man and four boys being, with little assistance, able to fill and complete 150,000 caps a day. All this machinery is, however, at present worked by hand. Two model rooms are attached to this department, containing specimens of every firework used in war, and many other interesting objects.

3rd. The royal carriage department in which every kind of ship and land gun carriage is made and repaired; with traversing platforms, ammunition waggons, carts, &c. Copper-lined powder-cases are also made. The sheets of copper are tinned instantly, on both sides, by a process displaying much ingenuity, the invention of one of the working timen employed here, superseding a tedious and unwholesome operation before in use, and effecting a considerable annual saving. This establishment contains a planing machine, invented by Bramah, set up in 1806, with apparatus for various operations in turning of wood and metal, worked by a steam-engine of 12 horse-power. Here is also a saw-mill, by Sir J. Brunell, set up in 1812, containing 6 frames of saws, wrought by a steam-engine of 20 horse-power. The smithy has about 20 forges.

The works in the manufacturing departments of the arsenal are in a perfectly efficient state; but, generally speaking, the machinery, except for percussion caps and musket balls, does not seem to be of the most modern or scientific kind. The separation of the departments under different authorities appears also to be in some degree adverse to the more general employment of steam power, except at an increased expense, thus leaving more to be effected by manual labour than would be requisite if a system of greater concentration and combination were adopted.

4th. The guns, which are arranged in the open air, comprise complete field and battering trains, mortars, howitzers, carronades, &c., with the guns belonging to many of the ships of war out of commission, numbering, in the whole, about 3,000 pieces of brass, and 19,000 pieces of iron ordnance, of 200 different varieties. The shot and shells, arranged in pyramidal piles, amount to nearly 2,000,000 in number. These, as well as every other description of store required for naval or military equipment, are kept in constant readiness, under the charge of the storekeeper's department. The various piles of brick buildings containing these articles, or appertaining to the departments before enumerated, are constructed on the grandest scale; and are as complete and efficient as can well be imagined. There are two *butts*, one within the arsenal and the other on the marshes, for the practice and proof of ordnance; but, as the shot frequently crosses the river, the service is liable to constant and serious interruptions from the passing of ships. A new practice range of nearly 3 m. extent, towards Erith, is therefore in course of formation, which will be free from the inconveniences now experienced; and will besides allow of the practice, at long ranges, of the new heavy guns (42 to 84 pounders), on Monk's and Millar's principles.

The number of artificers, labourers, and boys employed in the various departments of the arsenal may amount to about 700, exclusive of the convicts belonging to the Justitia hulk, stationed on the river, opposite to the arsenal, amounting to about 300.

The Royal Military Academy, an institution that has considerably raised the professional character of the corps of Royal Engineers and the Royal Regiment of Artillery was founded in 1719, but was not finally arranged until 1741. The establishment, which has varied at different periods, has at present 165 pupils, termed gentlemen cadets. It is under the direction of the Master-General and Board of Ordnance for the time being, and has a lieutenant-governor, inspector, and other officers. For the literary department, there is a professor of mathematics, and 23 other professors and masters for mathematics, fortification, plan-drawing, surveying, chemistry, landscape-drawing, German, French, History, Geography, &c. The academy has numbered amongst its professors several eminent men, among whom may be specified Mr. Thomas Simpson, Dr. Hutton, author of the *Mathematical Dictionary* and other valuable works, Mr. Bonycastle, Dr. Olmuthus Gregory, &c. The establishment formerly cost the public 8,000, or 10,000, per annum, for half the number of cadets now educated; but for several years past it has been conducted upon a self-supporting principle and with a much enlarged and a more efficient establishment, it now nearly maintains itself. The scale of payments to be made by the friends of cadets is as follows:—

	Per ann.
Sons of noblemen and private gentlemen, not being officers of the army or navy	125
Sons of admirals, and generals with regiments	80
Sons of generals without regiments	70

	Per ann.
Sons of captains and commanders in the navy, and colonels and regimental field officers of the army	60
Sons of all officers of the navy and army under the above ranks	40
Sons of officers who have died in the service, and whose families are in pecuniary distress	20

The sons of civil officers of the army and ordnance are admitted upon payment of the sums required from military officers of corresponding ranks.

The cadets receive an annual allowance of 45*l.* 12*s.* 6*d.* which is considered sufficient to supply every necessary article except linen. The education is excellent; the standard having been much raised of late: when the course is completed, the cadets, if found duly qualified, receive commissions in the Royal Engineers or Royal Artillery, according to their merit.

The academy, formerly within the arsenal, was removed in 1806 to a fine building on the upper end of the common, about 1 m. S. from the town. This edifice, which was built by Wyatt, consists of a centre and 2 wings, united by corridors, with a range of building behind, containing the hall, servants' offices, &c. The centre forms a quadrangle, with octagonal towers at the angles; and, beset with a variety of other apartments, contains the four teaching rooms or academies, as they are termed. The wings contain the apartments for the cadets and chief officers. The building, which is about 200 yards in length, is of brick, stuccoed over.

The barracks, erected for the accommodation of the Royal Artillery at different periods from 1783 to 1810, are situated on the N. brow of the common, and form a most extensive pile of building, calculated to accommodate 3,000 officers and men, and 1,200 horses. The principal front, 340 yards in length, consists of six ranges of brick building. The entrance consists of a handsome gateway, with Doric columns and military trophies. Exclusive of other apartments, this noble building contains a library and reading-room for the officers, a mess room, a guard room, a chapel capable of accommodating 1000 persons, &c. At a little distance from the back part of the chapel is a riding-school, on the model of an ancient temple.

The barracks for the corps of Royal Sappers and Miners are a short distance to the N.E. of the artillery barracks; they are constructed for 260 men.

The parade is in front of the barracks; and the open space on the common affords sufficient room for exercising the soldiers in the throwing of shells, and ball-firing. On the E. side of the barracks, on the descent leading to the arsenal, is the ordnance hospital, an extensive edifice, calculated to accommodate about 500 patients. It has a valuable library and museum. Several detached buildings, for the use of the artillery, have also been raised on different parts of the common; among which is a veterinary hospital for the horse brigade, with stalls for 66 sick horses. A division of the Royal Marines have also barracks and an hospital at Woolwich.

Perhaps, however, the most interesting establishment at Woolwich is the Repository, on the S.W. side of the barrack-field, for the reception of models of different fortified places, ships, warlike instruments and machines of all kinds, trophies taken in war, &c. The collection, which is alike extensive and valuable, is partly contained in the Rotunda, a circular apartment 119 ft. in diameter, originally erected by George IV. in Carlton Gardens, for the entertainment of the allied sovereigns when on a visit to this country in 1814. Near the Repository has lately been erected an Observatory for the use of the officers, containing a telescope and other philosophical instruments, and a museum.

The parish of Woolwich is governed, under a local act, by 30 commissioners, chosen by the parishioners, besides the rector and churchwardens. The Reform Act constituted Woolwich a portion of the par. bor. of Greenwich (which see.) Petty sessions are held here by the co. magistrates on Mondays and Fridays, and a court of requests for the adjudication of claims under 5*l.* every alternate Friday. Market days, \*Wednesdays, Fridays, and Saturdays. (*Par. Rep. and Private Information, obtained from the best sources.*)

WOOTTON BASSETT, a mun. bor., market-town, and par. of England, co. Wilts, hund. Kingsbridge, 78 m. W. London. Aren of the par., 4,380 acres. Pop. of do., in 1831, 1,896. The town, which stands on a hill, consists almost wholly of one street, about 3 m. in length, and tolerably well built, in the centre of which is the town-hall. The par. church is an old building, in the mixed style; the living, a vicarage worth 461*l.* a year, is in the gift of the Earl of Clarendon. It has, also, a chapel for Independents; a free school, founded in 1694, affording instruction to about 20 children; with charity and Sunday schools. It has no manufactures of any kind; and would hardly, indeed, have been worth notice, but for the circumstance of its having returned 2 mms. to the H. of C. from the 25th of Henry VI. down to the passing of the Reform Act, by which it was disfranchised. It was reckoned too inconspicuous to be included in the

provisions of the Municipal Reform Act. (*Mun. Corp. Appendix; Private Information.*)

WOOTTON-UNDER-EDGE, a market-town and par. of England, co. Gloucester, hund. Berkeley, on the declivity of a hill, as its name implies, 17 m. S. by W. Gloucester. Area of par., 4,890 acres. Pop. of do., in 1831, 5,482; of the town only, 5,064. The latter, traversed by a small stream, on which are several cloth mills, consists principally of 2 well-built parallel streets. The church, which is large and handsome, has some curious old monuments. The living, a vicarage, worth 112*l.* a year, is in the gift of the dean and chapter of Oxford. The grammar-school, founded in the 8th of Richard II., and revived in the time of James I. had, at the date of last inquiry, an income of 376*l.* 12*s.* a year: it supports 10 foundation scholars and is free to all other boys born in, or inhabiting Wotton and North Nibley. The boys are instructed in writing and accounts, and are "to use no language in the school but Latin." The Blue-coat school, established in 1693, has an income of 94*l.* a year; the general hospital, for 12 almshouses, has a clear income of 346*l.* a year; and Perry's hospital, also for 12 persons, an income of nearly 170*l.* a year. The aggregate amount of the public endowments in the par. reached, at the period referred to above, 1,130*l.* a year. (*Digest of Charity Repts.*) Wootton-under-Edge is a bor. by prescription, but has no extant charter: its corporation, consisting of a mayor and 12 aldermen, elected at an annual court-leet, has no municipal functions, revenues, or emoluments. The inhabs. of the town and surrounding district are chiefly occupied in the weaving of woollen cloth. In 1838, there were in the par. 5 woollen mills, wrought principally by steam, employing, in all, 182 hands (*Mills and Factories Report*); besides which, there were many looms wrought by the weavers in their own houses. Petty sessions for the hund. are held in Wotton. Markets on Fridays; fairs, Sept. 25th, for cattle and cheese. (*Parl. Repts., &c.*)

WORCESTER, an inland co. of England, having a very irregular outline and several detached portions, is bounded on the N. by the cos. of Salop and Stafford, W. by Hereford, S. by Gloucester, and E. by Warwick. Area, 462,720 acres, of which about 400,000 are supposed to be arable, meadow, and pasture. This is an extremely beautiful and well-watered co. It is traversed from N. to S. by the Severn, and in part, also, by its important tributaries the Avon from the E., and the Teme from the W. Surface finely diversified: the Malvern hills divide the S.W. part of the co. from Herefordshire; the Bredon hills, to the S., of Pershore, have an elevation of nearly 900 ft.; and there are some considerable hills on its N. frontier between Hales-Owen and Bromsgrove. The vales of Worcester and Evesham, or rather of the Severn and Avon, are alike beautiful and fertile; but the soil in other parts, especially on the E. side of the county, is cold and poor. Besides corn, cattle, and dairy produce Worcester produces large quantities of fine wool, apples, hops, and excellent cyder. We are sorry, however, to have to state that agriculture is by no means in an advanced state. "The system followed is, in itself, a bad one, and is carelessly and negligently conducted. There is no rotation as to cropping; nor are any pains taken to relieve the ground of water, though it be in many places very wet. Ploughing is badly performed, and the whole management of a slovenly description." (*Kennedy and Grainger, on the Tenancy of Land*, i. 358.) In 1838 there were in this co. 1,832 acres under hops. Estates of all sizes; farms for the most part small. Average rent of land, in 1810, 22*s.* 4*d.* an acre. Coal is found in the N. parts of the co., and the brine springs of Droitwich furnish immense quantities of salt.

The city of Worcester is the principal seat of the leather glove manufacture; the iron, hardware, and glass manufactures are carried on with spirit and success at Dudley; Kidderminster is famous for its carpets; and needles and fish-hooks are made to a greater extent at Redditch and Feckenham, in this co., than any where else in England or, indeed, in the world.

Worcestershire is divided into 5 hundreds, and 171 parishes. It sends 12 mems. to the H. of C., viz. 4 for the co., 2 each for the city of Worcester and the bor. of Evesham, and 1 each for the bors. of Kidderminster, Bewdley, Droitwich, and Dudley. Registered electors for the co., in 1839-40, 10,917, whereof 6,328 were for the E., and 4,589 for the W. division of the co. In 1841, Worcester had 46,969 inhab. houses, and 233,484 inhabs., of whom 114,753 were males, and 118,731 females. Sum expended on the relief of the poor, in 1838-39, 62,184*l.* Total annual value of real property in the co. assessed to poor-rates, in 1840-41, 995,242*l.*

WORCESTERS, a city, parl. and mun. bor. of England, locally situated in the co. of Worcester, of which it is the cap., but forming a co. of itself; hund. Oswald-slow, on the Severn, crossed here by a handsome stone bridge of 5 arches, 26 m. S.W. Birmingham, and 100 m. W.N.W. London; lat. 52° 9' 30" N., long. 2° 0' 15" W.

## WORCESTER.

The city and old mup. bor., comprising 220 acres, constitute about 1-4th part of the modern parl. and mun. bor., which had, in 1831, a pop. of 26,808; but the pop. of the modern parl. bor. in 1841, has not yet been stated.

Worcester is finely situated on the E. bank of the river, in a fertile and beautiful country; and is one of the best built, handsomest towns in the kingdom, having every appearance of wealth and respectability. "The main streets are wide, well paved, and lighted with gas; the central street, which traverses the city from N. to S., is of considerable length, and kept particularly clean and neat. A considerable extent of ground, comprised in the suburbs is unoccupied by houses, and consists principally of gardens and meadows. It is probable, however, that a great portion of it will, in process of time, form the site of new buildings. On the E. side of the canal the number of houses is rapidly increasing; and it appears probable, that the area included within the new boundary to the N. will be gradually filled up by villa residences. To the N., both within and beyond the Boundary of the Tything, the building of streets, and rows of dwelling-houses, as well as of detached residences of a very superior class, is going on rapidly." (*Parliamentary Boundary Report*.) Of the public buildings, the principal is the cathedral, originally founded in 1084, but not completed till 1374. It stands towards the S. extremity of the town, and its appearance has recently been greatly improved by taking down the ancient church of St. Michael, a most unsightly edifice, which stood close to the N.E. extremity of the cathedral, and greatly marred the prospect. Its exterior is extremely plain, and its attractions consist principally in its size and the lightness of its architecture. The central tower, though the stone be much decayed, is extremely fine. It is built in the form of a double cross; its external length, including buttresses, is 426 ft., and the internal 394 ft.; the nave, from the front to the W. transept is 180 ft. in length: the tower, which is about 200 ft. in height, is ornamented with light and elegant pinnacles. The general character of the building is early English; there are, however, some earlier parts. A crypt, part of the nave, the chapter-house, &c. are Norman; parts of the nave and aisles are decorated; the cloisters, and a fine S. porch are perpendicular. The interior is very spacious, mostly in the early English style, with elegant details and good groining. Across the S.E. transept is the monumental chapel of Prince Arthur, son of Henry VII., and in the middle of the choir is the tomb of King John, the top stage of which, with the effigy, is evidently of a date soon after his decease. (*Nickman*, 250.) There are several fine ancient monuments in different parts of the church, including that of the celebrated Judge Littleton, one of the founders of the English law, a justice of the Common Pleas under Edward IV., who died in 1481. Among the more modern monuments is that of the celebrated scholar Stillingfleet, author of the *Origines Sacre*, and other valuable works, bishop of the see from 1689 till his death in 1699, with an extravagantly eulogistic inscription written by the famous Dr. Bentley. Adjoining the S. side of the cloister is the ancient refectory of the monastery attached to the cathedral, a lofty and spacious hall, 130 ft. in length, by 38 ft. in width, now occupied as the King's School. On the E. side of the cloisters is the chapter-house, the library belonging to which comprises a valuable collection of books and manuscripts, chiefly relating to theology and common law. The nett revenue of the bishopric amounted, at an average of the three years ending with 1831, to 6,569*l.* a year. The chapter, previously to 1836, consisted of a dean, 10 prebendaries, and 8 minor canons. The canons or prebendaries were then reduced to 8, including the dean, and their emoluments were also considerably reduced. The income of the establishment averages about 12,000*l.* a year. The bishop's palace, on the bank of the river, is an incongruous but commodious edifice, formerly surrounded with walls. It has lately been arranged that the episcopal palace shall in future be the deanery; and the bishop is to reside at his house at Harlebury, 10 m. distant. An ancient gateway, called Edgar's Tower, leads into the precincts of the cathedral. There are remains of several monastic establishments, including a commandery of the Hospital of St. John, in different parts of the city; and it had formerly a castle, every trace of which has been obliterated, excepting the mound on which the keep stood. Several of the par. churches deserve notice: that of St. Andrews has a square tower, 90 ft. in height, surmounted by an octagonal spire 155 ft. 6 in. in height, making the total elevation of the latter 245 ft. 6 in. The church and tower are very ancient; but the spire is comparatively modern, having been added in 1751. All the livings in the city, except that of St. Peter, are rectories; and except All Saints (which is in the gift of the crown) they are all in the patronage of the dean and chapter. The most valuable are St. Martin's, worth 578*l.*; St. Nicholas, worth 260*l.*; and St. Peter's, worth 233*l.* a year.

Exclusive of its numerous churches, Worcester has chapels for R. Catholics, Independents, Calvinists, Wesleyans, Friends, &c. The guild-hall, a large brick edifice, constructed in 1723, the front of which is ornamented with columns, statues, &c., has a hall for the accommodation of the courts of assize, a council chamber, &c. The old co. gaol and house of correction was defective in its plan and accommodation; but a new gaol at the top of Foregate Street was built on Howard's plan, in 1824. The old city gaol, in Friar Street, was formerly a Franciscan convent. The market-house, in the High Street, is a spacious and convenient building; and the public subscription library, in Foregate Street, contains reading and news rooms, and a considerable collection of books. Here is also a small theatre, built in 1780.

The royal grammar-school attached to the cathedral was founded in the reign of Henry VIII., for 40 scholars, who are prepared for the universities, and instructed besides in various subordinate departments of knowledge. It has two exhibitions to Balliol College, Oxford. The free grammar-school, founded by Queen Elizabeth, in 1561, for 12 boys, has 14 exhibitions to the universities, of 30*l.* each, and scholarships at Worcester College, Magdalen Hall, Oxford. The great Lord Somers and Samuel Butler, author of *Hudibras*, were educated in this school. Here also are subscription schools on the Madras and Lancasterian plans, with several other schools for children of both sexes. The whole number of children at school may be estimated at about 3,000. A Diocesan Board of Education for superintending all the schools in connection with the Church in the diocese has recently been established. It has various almshouses, the oldest of which appears to be those of St. Oswald's hospital, founded in 1268: a city and county infirmary, erected in 1770; a lying-in institution, house of industry, female penitentiary, dispensary, &c. Several medical and other societies have been formed: a music meeting is held every third year in the hall of the king's school, the meetings in the intervening years being at Gloucester and Hereford; the proceeds are appropriated to the relief of widows and orphans of the clergy. Races take place in July and Nov.

Worcester had formerly a considerable manufacture of woollen goods; but this has been discontinued, and the chief business of the city consists at present (1842) of the manufacture of gloves and china and fine earthenware. The produce of the glove manufacture was 10 years ago estimated at about 50,000 dozen pairs oil-leather or beaver gloves, and from 450,000 to 500,000 dozen pairs kid and lamb-skin gloves. This trade has, however, greatly fallen off. In May, 1842, there were only 28 glove manufacturers, whereas, in 1826, there were 140; and the total annual produce does not at present (1842) exceed 5,000 dozen pairs beaver or oil-leather gloves, and 250,000 dozen pairs kid and all other kinds, including 80,000 dozen pairs thread gloves. China ware is produced here on a very extensive scale; and it is not too much to affirm that it is equal, both as respects quality and beauty of design, to any made at any other place in the kingdom. The materials used in the manufacture are mostly brought from Cornwall. The other principal products are lace, spirits, tanned leather, nails, and turnery ware, &c. There are some large iron foundries on the canal and river banks. The inland trade is carried on by means of the Worcester and Birmingham Canal and the Birmingham and Gloucester Railway, the nearest station of which is at Spitchley, 3 m. from the city. The canal communicates with the Severn, which is here navigable for large barges; and its banks have been furnished with good quays and spacious warehouses. After several frustrated attempts on the part of Joint Stock Companies to procure an act for improving the navigation of the river, a bill for that purpose received the royal assent in May, 1842. It places the management of the contemplated improvement in the hands of public commissioners, who are to be elected annually by the cities, towns, and landowners along the banks of the river, within the distance which is intended to be improved. A continuous depth of 8 ft. water is expected to be obtained from the entrance of the Berkeley Canal at Gloucester to Worcester; and from thence a depth of 6 ft. to the entrance of the Staffordshire and Worcestershire Canal at Stourport. The whole extent of the river to be improved is nearly 40 m. Mr. Cubitt, the engineer, has drawn up the plan adopted for the improvement. Its leading features are a succession of solid weirs built obliquely, instead of in the usual way, at right angles, across the stream, with side cuts or locks. Ascending the river, the first weir is placed a little below the city of Worcester. The channel is left clear to that point. The fall in this portion of the river being very gradual, it is proposed to cut out the shallows, and keep them clear by dredging. The greatly higher scale of gradients in the inclination of the river above Worcester rendered the employment of weirs and locks inevitable. The hop plantations of Worcestershire extend over about 1,532 acres,

and most part of the produce is brought hither for sale. The society of Worcester is extremely good, it being the residence of many respectable families, attracted hither by the beauty of the situation, cheapness of living, facilities of education, and the variety of amusements furnished by its theatre, assemblies, concerts, clubs, races, &c. It publishes four weekly newspapers, and has a savings' bank and four other banks, three of which are native establishments, and the fourth a branch of a Metropolitan Joint Stock Bank. In the year ending the 12th of June, 1841, there were sold in the Worcester corn-market 49,562 qrs. wheat, 13,266 do. barley, 1,274 do. oats, 4,912 do. beans, 912 do. pease, and 25 do. rye.

Worcester was chartered in the 1st of Richard I.; but the charter was not confirmed until the 2d of Henry III. Various other charters, &c. were afterwards granted by different sovereigns; but that by which the city was governed previously to the Reform Act dated from the 19th of James I. It erected the city and liberties of Worcester into a co. separate from, and independent of, the co. of Worcester. Under the Municipal Reform Act, the city is governed by a mayor, 11 other aldermen, and 36 councillors. Corporation revenue in 1840, 5,300*l.* It has a commission of the peace, with jurisdiction in nearly all felonies, excepting such as affect life and limb. A sheriff's court is held once a month by the under-sheriff; and a court of common pleas, and petty sessions weekly, besides several inferior courts. The assizes for the co. are also held here. A police force has been organized, and the peace of the town is well maintained. Worcester has returned 2 mems to the H. of C. since the 23d of Edw. I.: the right of voting previously to the Reform Act having been vested in the freemen. Reg. electors, in 1840-41, 3,037. It is also the seat of election and principal polling-place for the W. div. of the co.

Worcester is of great but uncertain antiquity. It is principally celebrated in history from its giving name to the decisive victory obtained here by Cromwell over the forces of Charles II., on the 3d of Sept. 1651. Among other eminent individuals, Worcester gave birth to the distinguished statesman, Lord Somers, born here in 1652. Markets, Wednesday, and Saturday. Fairs, eleven times a year, mostly for cattle, lambs, horses, linen, hops, cheese, &c. (*Part. Bound. and Mun. Reps.; Rees's Cyclopaedia; Priv. Inf.*)

WORKINGTON, a town of the U. States, in Massachusetts, cap. co. Worcester, 35 m. W. by S. Boston. Pop. in 1840, 7,497. It is pleasantly situated in a fine agricultural district; and being at the junction of several important roads, as well as on the great railway line between Boston and Albany, it is the centre of a considerable inland trade. The principal street, upwards of 1 m. in length, is well built, and has many good private houses and hotels. The court-house, jail, several churches, a state-asylum for the insane, the hall of the American Antiquarian Society, with a museum, and a library of 12,000 vols. (*Bradford*), are the chief public edifices. Worcester has several woollen, cotton, and paper-mills; machine factories, and printing-offices. The Blackstone Canal connects the town with Providence and other canals with Boston and the Connecticut line. The permanent settlement of the town took place in 1713, and its incorporation in 1722. (*Encyc. Amer.; Encyc. of Geog. Amer. edit.*)

WORKINGTON, a market town, par., and seaport of England, co. Cumberland, ward Alledale, on the Derwent, near its mouth, 7 m. N. by E. Whitehaven. Area of par., 7,730 acres. Pop. of do., in 1831, 7,196, of whom about 6,400 inhabited Workington township. The streets are mostly narrow and inconvenient; but of late years many good houses have been erected. In the upper town a new square has been built, in which the corn market is held. It has a small neat theatre, assembly and news rooms, and various other public buildings. The Derwent is crossed here by a stone bridge, of three arches. The par. church, rebuilt in 1760, has a fine altar-piece: the living is in the gift of — Curwen, Esq., whose mansion, Workington Hall, a fine castellated structure, on a richly wooded height, overlooks the town. A chapel-of-ease, in the Tuscan style, was built in 1823; and here, also, are chapels for Independents, Methodists, Presbyterians, R. Catholics, &c. A grammar school, founded in 1664 by Sir P. Curwen, has since ceased to exist; the founder having had only a life interest in the property with which it was endowed. There are, however, Lancasterian and female schools, a dispensary, and various institutions for the benefit of the poor, supported by subscription. Workington has manufactures of sailcloth and cordage, and a valuable salmon fishery on the Derwent, the property of the Earl of Lonsdale; but it derives its principal importance from the extensive collieries in its vicinity, belonging to the Curwen family, which furnish considerable quantities for shipment to Ireland, the Isle of Man, &c.

Workington harbour is protected by a breakwater, and has good quays; but it nearly dries at low water. It is

a creek of the port of Whitehaven; but in 1842 it had 46 ships of the burden of 6,715 tons. A little business is carried on here in ship-building, and in the importation of timber and other articles. Markets, Wed. and Sat.; fairs, May 18. and Oct. 18. Races are held here annually in August.

**WORKSOP**, a market-town and par. of England, co. Nottingham, wapent. Bassettlaw, on the Rytton, a tributary of the Idle, 23 m. N. Nottingham. Area of par., 18,320 acres. Pop. in 1831, 5,566. The town, consisting chiefly of one street, crossed by two others, is well built, paved, and lighted. Its church, which formerly belonged to an Augustinian priory, is a fine old edifice, with two lofty towers, and has within several ancient monuments. The living, a vicarage worth 388*l.* a year clear, is in the gift of the duke of Norfolk. Here, also, are places of worship for various sects, a national school, and some small endowments for parochial and charitable purposes. The town is celebrated for its malt, and was formerly, also, celebrated for its liquorice, of which large quantities were raised in the adjoining district; latterly, however, its culture has been wholly abandoned.

Worksop may be regarded as the cap. of the district popularly called the "dukery," from its containing Worksop-moor, formerly a seat of the Duke of Norfolk. Clumber Park, the seat of the Duke of Newcastle, and Welbeck Abbey, the seat of the Duke of Portland. These are all magnificent residences in fine parks. Recently, however, the Duke of Newcastle has purchased Worksop-moor; and the house, which had been rebuilt in 1763, either has been or is to be immediately pulled down. Clumber Park, now about 11 m. in circ., and finely laid out and wooded, was, so late as the era of the American war, little better than a black heath, interspersed with bogs and marshes! In this district, also, is Thoresby, the seat of Earl Manvers. Markets on Wednesday. Fairs, Mar. 31. and June 21. for cattle and sheep; Oct. 14. for horses and cattle; and about three weeks after the last, a statue fair. (*Requisites of England and Wales*, art. Nottingham; and *Private Information*.)

**WORMS** (an. *Borbetomagus*), a city of W. Germany, grand duchy of Hesse Darmstadt, prov. Lower Hesse, cap. cant. on the W. bank of the Rhine, near the border of Rhenish Bavaria, and 26 m. S.S.E. Mentz. Pop., about 8,500 (*Berghaus*). It was formerly an important free city of the empire, but is now much decayed, and is surrounded by dismantled and ruined walls. "Its interior," says Mr. Chambers, "consists of a single good street, lined with tall mansions, inhabited by persons of an inferior order, and a number of back lanes and detached buildings, many of them vacant and desolate. In a piece of open ground behind the main street, stands the cathedral, a building of red sandstone, its foundation dating as far back as the beginning of the 11th century (*Schreiber, Guide du Rhin* says the 8th). The original part of this edifice is Gothic, but the larger portion is in the Byzantine style; the interior arches being all rounded, and the pinnacles and dome fretted in the Moorish taste. The building contains a number of excellent pieces of sculpture, and the high altar at the E. end is environed with ancient carvings, in oak." (*Tour on the Rhine*, 60.) This cathedral has 2 choirs, each surmounted by a cupola, one of which rises 137 ft. (*Schreiber*) above the pavement. The W. choir is a good specimen of the architecture of the 12th century, and has a magnificent rose-window of that period. The Lutheran church in the market-place, in which is a painting of Luther before the Diet of Worms, in 1521, occupies the site of the council-hall, in which that event took place. This hall was destroyed when the city was bombarded by the French, in 1689; at which time, also, a vast number of houses were destroyed. From this period, in fact, the decay of Worms may be dated; many of the inhabs. having afterwards settled in other German towns, and in Holland. Some of the other churches deserve notice; and there are 2 synagogues. Charlemagne was married at Worms; and it was frequently inhabited both before and after his time, by the Frankish sovereigns; but no remains of the imperial palace exist, except a few fragments of a wall, forming part of the *Bürgerhop*, a prison, and police-office. Worms is the seat of a consistory, about half its inhabs. being Protestants; and it has several convents and hospitals, a gymnasium, and elementary schools, supported by different religious sects. It has manufactures of tobacco, sealing-wax, hats, &c.; but its principal trade is in wine, and other agricultural produce. The vicinity of Worms, celebrated by the ancient Minnesingers as the *Wonnegau*, or 'land of joy,' is in great measure covered with vineyards, producing some of the best growths of the Rhine. The famous *Liedfrauenmilch* is grown around the church of Notre Dame, close to the city. Worms is supposed to owe its origin to a fort erected here by Drusus; many Roman antiquities have been discovered in and near it. Among the councils held at Worms, that in 1122 was the most famous. Diets were, also, held here in 1492, 1517, and 1521. The

latter is famous from the fact of Luther having, as already stated, appeared before it, to explain and answer for his opinions. On appearing before the Diet, he displayed equal firmness and moderation. An edict was, however, issued against him on the 26th of April, by which he was excommunicated as an obstinate heretic. But previously to this, in consequence of the determination of the emperor and the other princes who had given him a safe conduct, not to forfeit their word, he was allowed to withdraw from the city in safety. (*Schreiber; Berghaus; Robertson's Charles V.*, book ii.)

**WORTHING**, a maritime town and fashionable watering-place of England, on the English channel, co. Sussex, rape Bramber, hund. Brighton, in the par. of Broadwater, a village about a mile to the N., 49 m. S. by W. London, and 10 m. W. Brighton. Area of par., 2,240 acres. Pop. of do. in 1831, 4,576, of whom nearly 4,000 were supposed to belong to the town. Until within the last 50 or 60 years, Worthing was only an inconsiderable fishing village; and is much indebted for its increase and celebrity to the visits of the royal family during the latter part of last century. The buildings of the town extend along the coast for about  $\frac{1}{2}$  m., and the main street runs for somewhat more than  $\frac{1}{4}$  m. in a N. direction. Excepting in its centre, the houses are mostly arranged in regular terraces, though many are isolated and interspersed with fields and gardens. The ranges of building fronting the sea are generally faced with creamy coloured brick made from a peculiar clay found in the vicinity, and the town is well paved, lighted, and has an ample supply of water. The chapel-of-ease, erected in 1812, at a cost of 12,000*l.*, is a very neat edifice, with a Doric portico. The living, a curacy worth 150*l.* a year, is in the gift of the rector of Broadwater. Here, also, are chapels for Independents and Wesleyans, to which Sunday schools are attached; with well attended national schools for both sexes, supported by subscription; a savings' bank, and a small, but elegant theatre, opened in 1807. The market-place consists of ranges of covered stalls built around a square area. The Esplanade, a raised causeway, extends along the shore for the whole length of the town; near its W. extremity are the Royal Baths, comprising two complete suites of apartments. The New Pavilion Baths, recently built, adjoin the Sea House Hotel. It is almost superfluous to add, that it has numerous hotels, with assembly-rooms; libraries, reading and news-rooms, convenient bathing-machines; and the other accommodations incident to a well-attended watering-place. Fine sands extend along the coast for 7 m. to the W. and 3 m. to the E. of the town. These, with the gradually increasing depth of the water, which gives the opportunity of bathing at any time of the tide, added to the mildness of the climate, in consequence of the shelter afforded on the N. and E. by the South Downs, render Worthing especially suitable as a place of resort for invalids. No manufacture of any kind is carried on; but the mackerel and herring fisheries are usually very productive, and contribute largely to the supply of the London markets. An annual fair is held on the 20th of July; market-days, Saturday and every alternate Wednesday, for corn. (*Guide to Watering-places of England; Priv. Inf.*)

**WREXHAM**, a parl. bor., market-town, and par. of Wales, co. Denbigh, hund. Bromfield, on the high road between Shrewsbury and Chester, 11 m. S. by W. the latter. The par. of Wrexham includes no fewer than 12 townships, 2 only of which and a small detached portion of a third are included in the parl. bor., which has an area of about 1,145 acres, and had, in 1831, a pop. of 5,464.

Wrexham is a handsome and lively town, with spacious streets crossing each other at right angles, and neatly and substantially built houses; it is, also, well paved, lighted with gas, and plentifully supplied with water. The church, dedicated to St. Giles, is a large and venerable structure, is deservedly regarded as one of the principal ecclesiastical edifices in the principality. It was erected about 1479 on the site of a more ancient structure: it is in the Perpendicular Style, and is covered with grotesque sculpture; but in correctness of design and proportion it is surpassed by few buildings of the same date. It consists of a nave, with side aisles and a chancel, the whole length being 178 ft., and the breadth 72 ft.; the aisles are separated from the nave by clustered columns supporting pointed arches; and the ceiling is of oak, in imitation of groined stone. The tower, which was not completed till about 1506, is 135 ft. in height; it consists of several successive stages pannelled throughout, and decorated with numerous statues of saints placed in niches of the buttresses; which latter are surmounted by 4 light open-work turrets rising 24 ft. above the battlements. It has a trade that surrounds the summit of the tower. It has a fine altar-piece, and some interesting monuments; among which are two to members of the Middleton family, admirably sculptured by Roubilliac. The living, a valuable rectory, worth 746*l.* a year, is in the gift of the bishop of St. Asaph. It has, also, a Rom. Cath. chapel, and four

places of worship for Protestant dissenters; a house of correction for the co., with 7 wards; a free endowed grammar-school; 2 parochial national schools; a public library; reading news, and lecture-rooms; agricultural and horticultural societies; a neat theatre; and a property, yielding 230*l.* a year, for distribution among the poor and other charitable purposes. The town-hall, at the head of High Street, has a large room used for public meetings. Annual races take place in October. The town is under the jurisdiction of the co. magistrates, who here hold monthly petty sessions for the hundreds of Bromfield and Gale. The Reform Act conferred on Wrexham the privilege of voting in the return of a mem. to the H. of C., along with the bors. of Denbigh, Holt, and Ruthin. Registered electors for Wrexham, in 1839-40, 259; do. for the entire bors. 941. It is one of the polling-places for the co. No particular branch of trade or manufacture is now carried on here; though Leland describes it, some centuries since, as containing "sum merchautes and good broker (buckler) makers." It owes its present degree of activity principally to its situation on the main road from North Wales through Chester to Liverpool. Coal, iron, and lead mines are extensively wrought in the parish, which has also some large iron works. Exclusive of several of minor importance, a large fair, which continues for 14 days from the 23d of March, and is attended by traders from a great way round, is held here annually, for the sale of horses, cattle, Manchester, Birmingham, and Sheffield goods, Irish linens, Welsh flannels, Yorkshire and other woollen cloths, &c. Five large areas in the town are fitted up with booths and temporary shops, for the accommodation of the dealers in the fair. Market-days, Monday and Thursday. (*Nicholson's Cambrian Guide; Panorama of N. Wales; Bound. Rep., &c.*)

**WURZBURG**, a city of Bavaria, c. Lower Franconia, of which it is the cap., on the Mayn, by which it is divided into 2 parts, 62 m. S.E. by E. Frankfurt, lat. 49° 47' 48" N. long. 7° 35' 0" E. Pop., exclusive of students and troops, about 22,500. Würzburg is finely situated, in a hollow surrounded by vine-covered hills, and traversed by the Mayn, here a large and fine stream, covered with boats and barges. The greater part of the city is on the right or N. bank of the river, the communication with the citadel, and a suburb on the opposite bank, being kept up by means of a handsome bridge. Würzburg is inclosed by walls, and, being one of the oldest towns of Germany, is irregularly laid out, its streets being generally narrow and angular; it has, however, some venerable edifices. The cathedral was originally founded in the 8th century, but the earliest portions of the present building appear to date from the 11th or 12th. The interior has been modernized with little taste; but it has some monuments worth notice, including those of a long series of the prince-bishops of Würzburg, the sovereigns of the city and adjacent territory, for upwards of 1,000 years. There are 82 other churches, the finest of which is the Marienkirche, in the pointed Gothic style. The royal, formerly the episcopal, residence, in a small square, was erected early in the last century. It is of an oblong form, on the plan of the palace at Versailles, and is of great extent, including, besides a magnificent staircase, upwards of 280 apartments, mostly fitted up in the style of Louis XIV. The gardens attached to it form a favourite promenade. The great hospital is an extensive and well conducted establishment, partly subsidiary to the school of medicine, for which the university of Würzburg is famous. This university was founded in 1403, and revived in 1582; at different periods it has been in a very flourishing state. It has some good scientific collections, and a library of 120,000 volumes. In 1832, it had 521 students, of whom 244 attended the medical classes, 189 the law, 118 the divinity, and the philosophical, &c. (*Journal of Education*); but the number of students has since declined, and probably does not at present (1842) amount to 400. It has, also, a gymnasium, a teachers' seminary, musical and polytechnic institutions, a society of arts and sciences, and an infirmary for the cure of deformities. Only 3 or 4 of the numerous monastic institutions formerly established in the city now exist. Würzburg is the seat of the court of appeal for the circle, and a bishop's see. Its manufactures consist principally of woollen stuffs, hats, leather, sealing-wax, and surgical instruments. It is the principal depot for Franconian wines, which are mostly sent down the Mayn to Frankfurt; and its trade will most probably be materially increased by the opening of the canal from Bamberg on the Mayn to Dietfurt on the Altmühl, an affluent of the Danube. Würzburg was secularized and given to the Archduke Ferdinand of Austria in 1803, and was ceded to Bavaria in 1815. (*Berghaus; Dict. Géog., &c.*)

**WYCOMBE (CHIPPING, or HIGH)**, a parl. and mun. bor., market-town, and par. of England, co. Buckingham, hund. Deaborough, on the Wick, a small tributary of the Thames, and on the high road from London

to Oxford, 27 m. W.N.W. the former. The old parl. and mun. bor., which were co-extensive, did not include the whole of the town; but the modern mun. bor. is rather more than three times the size of the former, and the modern parl. bor. is identical with the par. The latter has an area of 6,380 acres; with, in 1831, a population of 6,299. Wycombe extends for 1½ m. along the valley in which it is situated; and, though it has increased but little of late years, its general appearance is that of a well-built, prosperous, market-town. The principal roads communicating with the country to the N.W. and S.E. diverge from the market-place in the centre of the High Street. The church, a large and venerable structure in the perpendicular and early-decorated styles, has a tower at its W. end, 108 ft. in height, erected in 1522; but the rest of the church dates chiefly from the latter part of the 13th century. The interior has a fine altar-piece, and several monuments, among which is one by Scheemakers, to the Earl of Shelburne, father of the first Marquis of Lansdowne, who died in 1761, and another by Carlini to a Countess of Shelburne. The living, a vicarage worth 140*l.* a year, is in the gift of the Marquis of Lansdowne. The Independents, Baptists, and Friends, have places of worship here. The town-hall, erected in 1775, is a large and respectable brick building, supported on Queen pillars. The free grammar-school, founded by Anne Elizabeth, has attached to it some almshouses, and an income of about 300*l.* a year. Though established for an unlimited number of scholars, only 27 were receiving instruction at the date of the late inquiry. Here, also, is a girls' Lancasterian school, with numerous bequests for the general relief of the poor. The manufacture of chairs is the only one of any importance carried on in the town. Some years since a considerable quantity of pillow lace was produced here; but this branch of industry has been nearly superseded by the machine-made lace of Nottingham and other places. There are several considerable paper-mills near the town, on the Wick, and others in different parts of the parish. But the prosperity of High Wycombe is mainly owing to its being a place of considerable thoroughfare, though, since the opening of the Great Western Railway, that has materially diminished; and to its being the market-town for a district of 10 m. round. It has an extensive corn-market.

The earliest extant charter dates from 1586. Under the Mun. Reform Act it is governed by 4 aldermen, and 12 councillors.

The bor. has returned 2 mems. to the H. of C. since the 28th of Edward I. Previously to the Reform Act the right of election was vested in the mayor, aldermen, bailiffs, and burgesses, of whom there were usually about 180. As already seen, the limits of the modern parl. bor. have been considerably enlarged. Registered electors, in 1839-40, 339. Waller, the poet, was mem. for this bor. in 1625. A little S.W. from the town is Wycombe Abbey, the seat of Lord Carrington, by whose ancestors it was purchased from the Lansdowne family. *Monday, Friday, fair, Monday before Michaelmas. (Mun. Corp. and Bound. Rep., &c.)*

**WYMONDHAM, or WYNDHAM**, a market-town and par. of England, co. Norfolk, hund. Forehoe, on a hill, 9 m. S.W. by W. Norwich. Area of par. 11,240 acres. Pop. of ditto, in 1831, 5,445. The town, on the high road from London to Norwich, has a market-place with an ancient cross. The church, a venerable structure, in a mixed style, consists of a nave with aisles, a large W. tower, and another at the intersection of the nave with the transepts. Originally it formed a part of a monastery founded in the time of Henry I., to which the town appears to have owed its earliest importance. Within are many curious monuments, including that of the founder, William de Albini; a large carved font, &c. The living, a vicarage worth 515*l.* a year, is in the gift of the Bishop of Ely. Here, also, are chapels for Independents, Wesleyans, Baptists, Friends, &c. The grammar school, founded by Edward VI., has a total income of about 180*l.* a year. It is governed by 12 trustees and 15 governors, and is free to all boys of the par.; but, in consequence of a pending chancery suit, it had no pupils at the date of last inquiry. It has 2 exhibitions at Cambridge, and a share of an exhibition for scholarships. A fuel allotment charity has an income of 86*l.* 1*sh.* a year; and an endowment of 65*l.* yearly is expended in payment to the vicar, to old unmarried women of the parish, and in the partial support of 5 schools. (*Digest of Charity Reps.*)

A national school affords instruction to about 100 boys and 70 girls: 200 children attend a Sunday school attached to the church, and about the same number frequent one attached to a dissenting chapel. It was estimated, in 1839, that about 1-6th part of the pop. was supported by weaving, principally bombazines, crapes, and other Norwich goods. There were about 300 looms at work in the town; about 1-3d for a resident manufacturer, 1-3d for Norwich manufacturers, and the rest for various employers. The average wages of weavers at that

period amounted to only about 7s. a week per loom, many of the weavers having only half-work; and few members of the weavers' families were brought up to assist, but sought rather for agricultural or other employment. (*Hamed-loom Weavers' Reports*, ii. 328, 329.) A court leet is held annually, and a manorial court occasionally. A little to the N. of this town is Kimberley Hall, the seat of Lord Wodehouse, in an extensive and finely-wooded park. The Wyndham family, one of the most illustrious in the co. of Norfolk, which derived its name from this town, has produced, among other eminent individuals, the distinguished parliamentary leaders, Sir William Wyndham of the reigns of George I. and II., and Mr. Wyndham, of that of George III. Markets at Wyndham, on Fridays; fairs for cattle, &c., Feb. 12th, May 16th, and Sept. 29th.. (*Parl. Repts.*, &c.)

## X.

**XALAPA, or JALAPA**, a town of Mexico, state Vera Cruz, on the high road from Vera Cruz to Mexico, 55 m. N.W. the former. Pop. estimated at 13,000. It stands on a platform, about 4,300 ft. above the level of the sea, surrounded by fine mountain scenery, and sometimes subject to heavy fogs. Its climate is generally mild and salubrious, though it is said to be neither so clean nor so well built as Vera Cruz; but it has numerous houses of 2 stories, built after the old Spanish manner, in a square, enclosing a court planted with trees and flowers, with a fountain in the centre. The cathedral and other churches, though in an indifferent style of architecture, are very gorgeous. This was formerly a great entrepôt for the European trade with Mexico, and large fairs were held here; but its trade has greatly diminished, and its shops and warehouses do not now make much show; at present, indeed, Xalapa is chiefly celebrated for its washing; and many of the inhabs. of Vera Cruz send their clothes hither to have them cleaned. (*Bullock*.) The more wealthy inhabs. of Vera Cruz, and, indeed, of all the adjacent coast district, or *tierras calientes*, resort to Xalapa in the summer to avoid the heat, insects, and fevers of the low country, from which it is free. The well known medicinal herb *jalap*, grows abundantly in the vicinity of this town, to which it is indebted for its name. (*Ward's Mexico*, ii. 19, 20.; *Poinsett's Mexico*, 35-37.)

**XERES DE BADAJOS, or DE LOS CABALLEROS**, a town of Spain, in Extremadura, prov. Badajoz, near the Ardilla, a tributary of the Guadiana, 40 m. S. Badajoz. Pop. estimated at about 9,000. It is walled, and, like most Spanish towns, had numerous monastic institutions; but from its being out of any great route, it is rarely visited by travellers. It has manufactures of linen fabrics, leather, hats, soap, &c., and a large trade in cattle, which are extensively reared in its neighbourhood.

**XERES DE LA FRONTERA**, a city of Spain, in Andalusia, prov. Cadiz, on the road from Cadiz to Seville, near the Gualdate, 17 m. N.N.E. Cadiz. Pop. according to Miñano, 31,000, which, though perhaps somewhat underrated, is, we suspect, much nearer the mark than Captain Scott's estimate of 90,000. "Xeres is situated in the lap of two rounded hills, which shelter it to the E. and W.; and it covers a considerable extent of ground. The city, properly so called, is embraced by an old crenated Moorish wall, enclosing a labyrinth of narrow, ill-built and worse drained streets; but this wall is of no great circuit, and is so intermixed with the houses of the suburbs as to be visible only here and there. The limits of the ancient town are, however, well defined by the numerous gateways still standing. Some of the old buildings and narrow streets are striking in appearance, and the number of gables and chimneys cannot fail to strike one who has been long accustomed to the flat-roofed cities of Andalusia." (*Scott's Honda*, &c. ii. 79.) It has eight par. churches, among which is one that is collegiate, with a library and a collection of coins; a town-hall, numerous convents; a foundling, an orphan, and other hospitals; several schools, a college, a public granary, infantry barracks, and an old fortress, are the principal public edifices. The streets, even in the best parts of the city, are disgustingly filthy; and the want of cleanliness is no doubt the main source of the destructive epidemics with which the town is frequently visited.

Xeres derives its principal or rather its sole importance from its being the great emporium of the well-known wine, called sherry, grown in its vicinity. The principal wine merchants reside mostly in the suburbs, where are, also, the largest warehouses. These are all above ground, and are immense buildings, with lofty roofs supported on arches springing from rows of slender columns, having their walls pierced with numerous windows to admit of the thorough circulation of air. (*Scott*, ii. 79, 80.)

The vineyards, mostly situated on slopes, are scattered at considerable distances; in 1818 they were estimated to comprise an area of about 8,000 acres; and at present, perhaps, they may extend over 12,000 acres. It is not easy to form any very accurate estimate of the produce of the sherry vineyards, partly because there is no accurate account of the exports and of the stocks on hand, and partly because a considerable quantity of the light wine, called *moguer*, grown on the right bank of the Guadalquivir, is mixed up with the inferior sherries. Probably, however, the average annual export of sherries may amount to about 20,000 butts (the butt contains about 105 wine gallons), worth from 12s. to 65s. a butt! It is a mistake to suppose that good sherry is a cheap wine. "It may," says Inglis, "be laid down as a fact, that genuine sherry, one year old, cannot be imported under 30s. a dozen; and if to this be added the profit of the merchant, and the accumulation of interest, it is obvious that genuine sherry, 8 years old, cannot be purchased in England under 45s. a dozen." (*Inglis's Spain* in 1830, ii. 82.) When, therefore, any one sees fine old sherry advertised at 30s. or 35s. a dozen, he may be pretty well satisfied that it is a hoax, and that Marsala or Cape Madeira, and not sherry, is the staple of the wine.

The finer sherries are all made from the Xeres grape, with the addition of only about 2 bottles of brandy to a butt, and sometimes of a little Paxarete, or sweet sherry, and of Amontillado. The wines are mostly all kept in very large casks, approaching in some degree to the Heidelberg tun, and when any wine is drawn off from one of these *sacars*, butts, it is replaced by an equal quantity taken from the one oldest butt, so that it is idle to talk of the sherry found in the market belonging to any particular vintage. The dark or deep brown sherries are occasionally produced by boiling a quantity of pale sherry to one fifth part its bulk, and mixing up this residuum with paler sherries, in quantities proportioned to the shade required. Amontillado, made in imitation of the wine of Montilla, near Cordova, the driest of sherries, is made from a variety of grapes plucked before they are quite ripe. It is the purest of the sherries, and will bear no admixture of either brandy or boiled wine.

England is and has long been the principal market for sherries. They used originally to be introduced and sold under the name of sack; but it is only of late years, and especially since the decline in the taste for Madeira, that they have come into all but universal use among all classes as a dinner wine. It is not easy, indeed, to account for their extraordinary popularity; for, though sherry of good quality, and kept to a proper age, be a very superior wine, the finer varieties bear no proportion to those that are inferior; and it is, besides, too powerful to be used with any degree of freedom.

To show its popularity it is sufficient to mention that, in 1841, of 6,184,990 galls. wine entered for consumption in the United Kingdom, no fewer than 2,412,821 were sherry! The entries of port during the same year amounted to 2,387,017 galls, making together 4,799,839 galls, leaving only 1,385,142 galls for all the other sorts of wine! (*Scott's Honda* and *Granada*, ii. 78, &c.; *Inglis*, ii. 78, &c.; *Henderson on Wine*, 190, &c.)

Of late years Port St. Mary, on the N. side of the Bay of Cadiz, 10 m. S.W. Xeres, has absorbed a considerable part of the trade of the latter, the wine-merchants who have settled there having the additional advantage of being able to superintend the shipping of their wines. Xeres has a few manufactures of serges, leather, soap, &c., but only for the consumption of its own inhabs. On the plain outside its walls was fought, A. D. 714, the battle which finally overturned the Visigothic monarchy of Spain, and gave a great part of that country to the Moors. On the Gualdate, near the scene of this battle, is a Carthusian monastery, founded in 1571, once the most celebrated in Spain, but now in decay.

## Y.

**YAKUTSK**, a town of E. Siberia, cap. of the immense prov. of its own name, on the Lena, about 1,50 m. N.E. Irkutsk, lat. 62° 15' 50" N., long. 147° 44' E. Pop. about 4,000. According to Wrangell, "Yakutsk has all the character of the cold and gloomy north. It is situated on a barren flat, near the river. The streets are wide, but the houses and cottages are poor in appearance, and are surrounded by tall wooden fences. Here are five churches, a convent, a stone building for commercial purposes, and an olden wooden fortress with its ruined tower, built in 1647, by the Cossack conquerors of Siberia. The town has, however, undergone great improvements in the last thirty years. The Yakut huts have been replaced by substantial houses; the windows of ice or tale, have given way to glass in the better class of houses, and the more wealthy inhabitants begin to have higher rooms, larger windows, double doors, &c."

"Yakutsk is the centre of the interior trade of E. Siberia. All the most costly furs, as well as the more common kinds, walrus teeth, and fossil remains, are brought here for sale or barter, during the ten weeks of summer, from Anabur and Behring's Straits, the coasts of the Polar Sea, and even from Okhotsk and Kamtschatka. It is not easy to imagine the mountain-like piles of furs of all kinds seen here; their value often exceeds 2,500,000 roubles. Almost all the Russian settlers in Yakutsk employ their little capital in purchasing furs from the Yakuti during the winter; on which they realise a good profit at the time of the fair, when they sell them to the Irkutsk merchants.

"As soon as the Lena is clear of ice, the merchants begin to arrive from Irkutsk, bringing with them for barter, corn, meal, the pungent Circassian tobacco, tea, sugar, brandy, rum, Chinese cotton, and silk stuffs, yarn, cloth of inferior quality, hardware, glass, &c. But at the annual fair there is not the appearance of animation and bustle, which might naturally be expected. The goods are not exposed for sale, and most of the purchases are effected in the houses or enclosures of the citizens." (*H. Raugel's Siberia*, 11-13.) Dobell says, that the inhabs. are hospitable and gay. Several bails were given during his stay, and the dress, manners, and appearance of the people far surpassed what he expected in so remote a situation. (*Trav.* ii, 12.) The variations of climate are extraordinary; for, though, on the whole, cold predominates to a very great extent, the thermometer in winter often falling to -40° R., or 56° below the zero of Fah. The heat in summer is sometimes not inferior to that of the torrid zone!

The vast province of Yakutsk comprises, at least, three fifths of E. Siberia, and is watered by the great rivers Lena, Yana, Indigirka, and Kolyma, which supply vast quantities of fish. Iron, salt, and excellent talc are the chief mineral products: game, of many kinds, abounds. Large herds of cattle, &c., are reared near Yakutsk, and notwithstanding the severity of the winters, rye, barley, and even wheat, are said to succeed well throughout the province, except in those parts which are so far N. as to render the summer too short for ripening grain. (*See Dobell's Travels in Siberia*, ii, 21, &c.; *H. Raugel's Siberia and the Polar Sea*, &c.)

YANINA, improperly JOANNINA, (probably the an. Euxine), a city of European Turkey, prov. Albania, of which it is the cap.; on the W. bank of the lake of its own name, 80 m. W. by N. Larissa. Lat. 39° 47' N., long. 21° 17' E. Pop. said to be at present about 12,000. It occupies a small peninsula, extending into the lake, and a part of the adjacent shore, its site being tolerably level. Twenty-five years ago Yanina was a town of 30,000 inhabs., with numerous mosques, many large and well-built houses, and several palaces. It had then a considerable trade with the rest of Epirus, Roumelia, Wallachia, &c.; and a large annual fair, to which a good deal of Italian produce, with French and German manufactures, &c., were brought. It was, however, set on fire by order of its barbarian and bloodthirsty tyrant, Ali Pacha, in 1820, and was almost wholly ruined. The streets are narrow and crooked, and the houses are now mostly of mud. Numerous vacant spaces, especially about the citadel, are covered with ruins, and all its animation is confined to the bazaar. (*Burgess's Greece*, i, 61-63.)

The lake of Yanina is about 6 m. in length, and nearly 3 in its greatest breadth: it is narrowest at the N., and gradually expands towards the S. Mr. Burgess says that the scenery around it would be fine if its banks were wooded; but as it is, the lake is far inferior in respect of beauty to those of Italy or Switzerland, and is excelled by some of the Scottish lakes. An island opposite the peninsula has a church and monastery. The description given by modern travellers of the site of Yanina and its lake, answers perfectly to that of the city and lake of Euxine by Procopius. Justinian built a fortress at Euxine, apparently on the identical site now occupied by the citadel of Yanina. (*Cramer's Ancient Greece*, i, 141, 142; *Burgess's Greece*, &c.; *Hobhouse*; *Hughes*; *Cramer's Greece*, &c.)

YALKUND, the chief city of Chinese Turkestan, in a fertile plain, on the river of its own name, lat. 39° 19' N. long. 76° 17' 45" E. Its pop. has been variously estimated, but may probably amount to 50,000, exclusive of the Chinese garrison. (*Burnes's Bokhara*, &c., iii, 193.) It is enclosed by an earth rampart, pierced with five gateways, outside which are extensive suburbs; there are two citadels, one in the suburbs, and the other in the town. The houses, built of stone and clay, are mostly only one story in height; the streets are intersected by numerous canals and aqueducts which bring water from the river for the use of the inhabs. Yarkund has two large bazaars, numerous mosques, and 10 or 12 Mohammedan colleges, most of the native inhabs. begin Musulmen, though much more lax in their religious prejudices than their neighbours to the W. About 200 Chinese merchants reside in the place, and some Cash-

merians and Persians, but only a few Hindoos, and neither Jews nor Nogai Tartars. When Marco Polo visited this city, he found some Nestorian Christians among the inhabs. (*Ritter. Erdkunde von Asien*, p. 390. -400.)

"The productions of China," says Sir A. Burnes, "are transmitted to this prov., and sold to the natives of Bokhara and Tibet, who are permitted to frequent certain fixed markets. No Chinese crosses the frontiers; the trade to Bokhara being carried on by Mohammedans, who visit Yarkund for that purpose. The same vigilance to prevent the ingress of foreigners is here exhibited as upon the sea coast." Horses are a great article of trade; and it is chiefly to open a traffic in these animals, that Moorcroft desired to reach Yarkund, in which attempt, however, he was frustrated by the jealousy of the Chinese authorities. "Yarkund, with the adjacent prov. of Cashgar, formed the principality of a Mohammedan Khojir. Dissensions arose in the reigning family about eighty years since (in the time of Kien-long), and they called on the Chinese government as a mediator, which, as frequently happens, acted the part of a conqueror. The period which has elapsed since the capture of Yarkund has in no way diminished the precautions of the Chinese government. Yarkund is still considered as an outpost, and the communication between it and Peking is maintained in a most characteristic manner." (*See Burnes*, iii, 193-196.) The Mohammedan natives, indeed, fill the subordinate offices of state, but under the strict superintendence of the Chinese authorities. The garrisons, consisting of from 5,000 to 7,000 soldiers, are recruited from boys of 14 and 15 years old, who are sent back, after about as long a period of service. (*Burnes*.) According to some Chinese documents, the annual tribute of the Yarkund people to the Chinese comprises 30 oz. of gold, 35,000 do. of silver, 30,000 sacks of corn, 80 lbs. oil, 57,000 pieces of linen, 15,000 lbs. cotton, 3,000 lbs. copper, &c. (*Ritter, Erdkunde*, v, 402; *Klepworth*; *Marco Polo*; *Wallen*, &c., *in Calc. Asiat. Journ.*, &c.)

YARMOUTH, a pari. and munic. bor. and sea-port of England, partly and principally in the co. Norfolk, but partly, also, in that of Suffolk, on the Yare, at its mouth, in the North Sea, 19 m. E. by S. Norwich, and 108 m. N.E. London. Lat. 52° 36' 40" N., long. 1° 44' 22" E. The old pari. bor., which included the hamlet of South town, in Suffolk, in the par. of Gorleston, on the S. side of the river, had an area of 2,110 acres, with, in 1831, a pop. of 23,332; but the modern pari. bor. includes the whole par. of Gorleston, comprising the village of that name, and has an area of 3,940 acres, with, in 1831, a pop. of 25,448, and in 1841 of about 28,000. The part of the town on the E. side of the Yare, or Yarmouth properly so called, occupies a narrow peninsula, between the sea on the one hand, and the river on the other. "It consists of four principal lines of streets running nearly parallel with the river, and of an immense number of narrow lanes, or rows, that form the lateral communications between these streets. Very few of the rows exceed from 5 to 8 ft., and only two of them at the opposite ends of the town were passable for common wheel-carriages until the widening of some others in the centre of the town, not long since formed the street called Regent Street. The principal streets are well built, and wide, opening in some places into a spacious quay, market-place, and squares; and the town presents, on the whole, a thriving appearance. The best dwelling-houses are situated along the quay; many of these are substantial and handsome, as are, also, many of those in the other principal streets. Most of the shops are situated in the market-place, King Street, Broad Row, and Market Row; and the warehouses, granaries, malt-houses, and fish-offices, together with the inferior dwelling-houses, are in the different rows. On the N. E. and S. the town is enclosed by old walls, beyond which is an intermixture of every description of buildings; but principally of extensive warehousing premises, and residences of an inferior class. This part is not paved, and only partially lighted, and principally with oil lamps; but the whole of the town within the walls is well paved, and lighted with gas. A considerable extension beyond the old walls has taken place on the E. side; and long lines of streets, besides many detached dwellings and extensive fish-offices, and other premises connected with the trade of the place, now occupy a great part of the space between the town and the sea shore, particularly towards the new jetty. New houses are in progress also on the N. side of the town, along the road leading toward Calster; and along the road toward Nelson's monument, S. of the town, the whole of which neighbourhood, and more especially the line fronting the sea, it is contemplated to cover with a new town.

"Yarmouth is connected by a bridge over the Yare with South town, or Little Yarmouth. This suburb, forming the N. part of Gorleston par., consists principally of neat and substantial private residences; with docks, timber wharfs, building yards, &c. on the river, and in which much of the business of this port is carried on.

The other distinct group of buildings in Gorleston, which forms the village or town of that name, lies considerably more to the S., nearer to the entrance of the harbour. South town is very imperfectly lighted; and Gorleston is neither paved nor lighted." (*Mun. Corp. Rep.*)

Yarmouth quay is one of the most extensive and finest in England: it is upwards of 1 m. in length, and in some places 180 yards in breadth, having in its centre a planted promenade. Here is the town-hall, a handsome edifice with a Tuscan portico; the council chamber, which is highly decorated, has a full-length portrait of George II. The Star inn, near the town-hall, was once the residence of Bradshaw, president of the High Court of Justice which condemned Charles I.; and some of its apartments still remain apparently as he left them, or even as they were at an earlier period, for the house is of the Elizabethan age. Yarmouth parish church is one of the largest ecclesiastical edifices in the kingdom. It was originally founded in the time of William I.; but the most ancient parts of the present edifice date further back than about 1,250; and according to Rickman, only a portion of the building is early English; other parts, particularly the windows, being of the Decorated and Perpendicular styles. (*Rickman's Gothic Architecture*, p. 208.) It is 230 ft. in its greatest length, by 108 ft. in breadth. At the W. end are 4 octagonal towers, the outermost of which are surmounted with plain pinnacles, as are the octagonal towers at each angle of the S. transept. The tower, at the intersection of the transepts with the nave, formerly decorated with pinnacles, is now embattled, and supports a tall tinned spire erected in 1807, a conspicuous mark from the sea. The part of the interior W. of the tower forms a spacious choir, the ceiling of which is panelled in compartments, having coats of arms of different branches of the royal family of England, and of the Fastolfs, Gournays, Bardolfs, and other proprietors of the neighbouring castle of Calster. The organ in this church is one of the finest in England; and it has many interesting monuments. The chancel, comprising about 6 acres, is entered by handsome iron gates: on its W. side was standing, till the present summer, the Leaf Gate, a curious brick archway of the time of Charles I. The living, a perpetual curacy, worth 243*l.* a year, is in the gift of the dean and chapter of Norwich. A chapel-of-ease was built in 1716; and the living, a curacy worth 100*l.* a year, is in the gift of the corporation of Yarmouth, the minister's salary being derived from a local duty on coal. The living of St. Peter's church, an edifice in the Tudor style, built under a recent act, is a perpetual curacy, worth 160*l.* a year, in the gift of the incumbent of St. Nicholas' (the par.) church. Attached to the living of Gorleston and Southtown is a curacy, with a separate church, a modern erection, called St. Mary's Chapel, worth 200*l.* a year, lately in the gift of trustees. (*Ecclesiast. Rev. Rep.*) Here also, are chapels for R. Catholics, Independents, Unitarians, Baptists, Friends, a Jews' synagogue, &c.; and some remains exist of various convents suppressed at the Reformation. A free grammar school was formerly supported by the corporation, but it ceased to exist about the end of last century. The Children's hospital, founded in the reign of Edward I., is under the government of the corporation, and has an income of 857*l.* a year: it serves as a workhouse, and, also, maintains and clothes 30 boys and 20 girls, and 100 children are taught as day scholars. All children of parents belonging to the town are eligible to be admitted as day scholars, and, as vacancies occur, to become boarders by rotation, according to seniority. The charity school, founded in 1713, clothes and educates a considerable number of children; here, also, is a Lancastrian school, which educates about 150 boys; a girls' school, founded in 1810, for educating and clothing 80 poor girls; and a proprietary grammar school, founded in Southtown in 1833. The Fishermen's hospital, established and built in 1708, was chiefly supported by an annual government grant of 160*l.* a year, deducted from the beer duties, till 1832, when it was discontinued, in consequence of the repeal of the beer duty. This hospital is, however, otherwise endowed, and, at the date of the late inquiry, had an income of 55*l.* 10*s.* a year. Warren's charity, established in 1694 for the general relief of the poor, sick, orphans, widows, &c., has an income of about 375*l.* a year; and there are several other endowments for scholars and other charitable purposes. (*Charities' Rep. XXVI.*; and *Digest*, &c.)

There is in the town a very extensive silk factory for the winding and throwing of silk, and the weaving of crapes and other silk goods. The Municipal Corporation Report of 1836 states that "Ship-building, and the various trades with it, are also carried on to some extent in Yarmouth; nevertheless, it cannot be considered as a manufacturing town, but derives its importance and prosperity from the trade and commerce which it owes to its situation and port. The rivers Yare, Waveney, and Bure, which unite in Braydon water, adjoining the town, are navigable; the

first to Norwich, the second to Bungay, and the Bure to Aylsham; and they secure to Yarmouth an extensive trade in the exportation of the agricultural produce of the districts traversed by these rivers, and in supplying them with coals and other heavy goods. The export of grain and malt from this port is considerable, but farley greater than from any other part in England; but the principal business of Yarmouth is the herring and mackerel fisheries, and the curing and exportation of the herrings to foreign countries, particularly the states bordering on the Mediterranean. An extensive timber trade with the Baltic is also carried on; and a considerable number of square-rigged vessels belong to the port. Yarmouth roads have long been the principal rendezvous of the vessels in the collier trade; and the town derives some advantages from the supply of fresh provisions to them.

"The harbour of Yarmouth is formed by the river Yare: it has an awkward entrance obstructed by a bar. Great attention, however, appears to be bestowed on remedying this defect, and on the improvement of the port generally. Vessels drawing about 12 ft. water, or of about 200 tons' burden, can cross the bar and proceed up to the town at spring tides." The chief improvements of the harbour were effected by a Dutchman named Johnson, employed for the purpose, who first erected piers at the mouth of the river.

Yarmouth Roads, between the town and a line of outer sand banks, though so much frequented, are by no means free from danger. They are marked by buoys and floating lights. There belonged to the port, in 1842, 321 boats of under 50 tons each, and 312 vessels of above 50 tons each, the aggregate burden of the latter being 34,320 tons.

Yarmouth is the principal seat of the English herring-fishery. The herrings usually make their appearance in the roads about the middle of September, when the fishery begins, and continues till towards the end of November. They are partly cured, and partly sent fresh to the metropolis. The fishery of cod, mackerel, skate, pollock, red-mullet, whiting, &c., is also extensively carried on. In 1840 the gross customs duties received at Yarmouth, amounted to 46,732*l.*

Yarmouth has been, for a long time, more or less, frequented as a bathing place, for which, indeed, it is well fitted by its salubrity and its firm, shelving sea-beach. It has, also, a pier, projecting 450 feet into the sea, with public baths, assembly rooms, a neat theatre, a public library, public gardens, and all the establishments usual at a watering place. To the N. and S. of the town, facing the sea, are open and level places of ground covered with verdure, called the Dunes; and on the most southerly of these is a beautiful fluted column designed by Wilkins, erected in 1817 in honour of Nelson: it is 144 ft. in height, and is surmounted by a statue of Britannia. On other parts of the Dunes, are various batteries, the barracks, a fine edifice, formerly a naval hospital, built in 1803, at an expense of 120,000*l.*; a new workhouse, erected in 1830, at an expense of 8,000*l.*; numerous windmills, a racetrack, &c. On the other side, the environs of Yarmouth have no particular beauty; but the country is well cultivated, and the markets of the town are well supplied. Within a few miles, on the Suffolk shore, are extensive remains of the Roman station *Gariannonum*, so called from its situation at the mouth of the *Garifinus* or Yare; and within a similar distance, on the Norfolk shore, are the ruins of Calster castle, formerly a sumptuous mansion erected by Sir J. Fastolf soon after the battle of Agincourt.

The first charter of incorporation possessed by Yarmouth appears to have been granted by John in 1208; but the governing charter previously to the late acts was that granted by Queen Anne, in 1702. Under the Municipal Reform Act the borough is divided into 6 wards, and is governed by a mayor, 11 other aldermen, and 36 councillors. Corporation revenue, about 6,000*l.* a year.

Yarmouth has sent 2 mems. to the H. of C. with little intermission, since the time of Edward I., the right of voting, down to the Reform Act, having been in the sons of freemen, and in apprentices serving a seven years' apprenticeship to freemen within the bor. Reg. electors, in 1830-40, 1,904. It has two banks. The bor. has a commission of the peace, and a gaol, an admiralty court held weekly by the mayor, a 40*s.* court of requests, courts leet, piepoudre, &c. The maritime jurisdiction of the corporation extends for 10 m. up the rivers Bure, Yare, and Waveney. Two markets are held weekly; that on Saturday is extensive, that on Wednesday, of minor importance. A fair is held on Friday and Saturday in Easter week; a regatta annually, &c.

Yarmouth communicates with Norwich daily by 2 coaches and 2 steam boats, London, Colchester, Ipswich, Bury, &c. by daily coaches, and with London and Hull by steam packets; the Leith, Dundee, Aberdeen, and other steamers, usually call here in the winter. (*Bussard, Mun. Corp.*, and other *Parl. Reps.*, and *Local Inform.*)

YARMOUTH, a market town and par. of England, on the N.W. shore of the Isle of Wight, at the mouth of the little river Yar, immediately opposite Lymington, and 9 m. W. Newport. Area of par. 60 acres. Pop. of ditto, in 1831, 586. This town, which has long been in a stationary state, would have been wholly unworthy of notice in a work of this kind but for the circumstance of its having enjoyed the important privilege of sending 2 mems. to the H. of C., from the era of Edward I. down to the passing of the Reform Act, by which it was most properly disfranchised. It was, in fact, one of the most perfect specimens of a proprietary bor. (*Parl. Rep.*, &c.)

YECLÁ, a town of Spain, prov. Murcia, at the foot and on the declivity of a hill, 43 m. N. by E. Murcia. Pop., according to Miñano, 11,600. It was formerly walled and had a fortress, but of these there are now no remains. Its principal buildings comprise 2 par. churches, some convents, an hospital, an ecclesiastical tribunal, and a prison. Its neighbourhood is very fertile; and its inhabs. are mostly occupied in the production of corn, flour, wine, brandy, and leather. Near Yecla are the traces of a more ancient town, where various Roman antiquities have been discovered. (*Miñano; Dict. Géog.*)

YEDDO, or JEDDO, the chief city of Japan, and the residence of the *shōgun*, military emperor; on the S.E. shore of the island of Niphon, prov. Monaka, at the bottom of the Bay of Yeddo; lat. 36° 30' N., long. 140° E. Its pop. has been variously estimated at from 760,000 to 1,500,000; but the probability is, that the first of these numbers is beyond the mark. Yeddo is said to be surrounded by a ditch, and intersected by numerous canals and branches of the river Tonaki, which are navigable for vessels of moderate burden. It has 2 large suburbs. Its internal plan would appear to be less regular than that of most other Japanese cities; but its streets and squares are clean, and some of the former are of prodigious length. Each street is appropriated to persons of one trade only, lined with covered arcades, and closed at night by gates at each extremity. The houses are mostly 2 stories in height; but being built and almost wholly of wood, destructive fires are very frequent. Yeddo has many temples, Buddhist convents, and other large public buildings; the emperor's palace occupies a large extent of ground. This city has a considerable trade; but there are no materials for forming any estimate of its amount. For farther information as to Yeddo, we must refer the reader to the works of Kämpfer, Thunberg, Siebold, &c.

YEMEN, a district of Arabia, which see.

YENISEI, a great river of N. Asia, in Siberia, through the central part of which it flows, its basin lying between those of the Lena to the E., and the Obi to the W., is supposed to comprise an area of near 1,000,000 sq. m., being about the same size as the prov. of Yeniseisk. The Yenisei rises within the Chinese Empire, not far from lat. 51° N., long. 98° E., and proceeds at first W. for about 50° of long., to near the point where it leaves the Chinese frontier. It then turns northward, and pursues generally a northerly course to the Arctic Ocean, which it enters by a wide estuary called the bay of the 72 islands, the mouth of which is in about lat. 72½° N., long. 85° E., about 200 m. E. of the gulph of Obi. The entire course of the Yenisei has been estimated at 2,600 m. Its chief affluents join it from the E., its tributaries from the W. being of much less importance. Various towns in the upper, with Krasnojarsk, Yeniseisk, &c. in the middle and lower part of its course, are on its banks; Irkutsk is on its great tributary the Verkhne-Tunguska, which flows out of Lake Balkal. As far as Krasnojarsk it runs through a mountainous country, and thenceforward to Yeniseisk, where its width, when highest, is about 1 m.; its banks are elevated and precipitous. A survey of the river was completed in the last century by the Russian government, up to this town; and from this it appears that its channel varies from 2 to 8 fathoms in depth. This noble stream, however, like the other large rivers of Siberia, is but of little use, inasmuch as it flows, for the most part, through desolate wastes; its embouchure being also in a frozen sea, and the river itself being frozen over for the greater part of the year. The Russian surveyors were stopped in their progress upwards, by the ice at Turnehansk on the 1st of October, and by the 10th the river was completely frozen over; and it was not till the succeeding 4th of June that they were enabled to proceed with their survey. (See *Wrangell's Siberia*, &c. *Introd.*; *Dict. Géog.*)

YEVIL, a market-town and par. of England, co. Somerset, hund. Stone, on the border of Dorset, on the Yeo or Ivel, a tributary of the Parrot, here crossed by a stone bridge, 18 m. S. Wells. Area of par. 3,890 acres. Pop. of do., in 1831, 8,921, of whom about 5,000 inhabited the town. Yevill has 17 parishes about twenty streets and lanes, some of which are wide and open thoroughfares, the houses being generally good and built of freestone. The par. church, a light Gothic structure, with a large

plain tower at the W. end, is supposed to date from the time of Henry VI. An ancient crypt, an adjoining chapel, and the handsome altar in the church, are worthy of notice. The living, a vicarage, with the curacy of Preston, of the clear annual value of 2911., is in the gift of — Phillips, Esq. Here, also, are places of worship for Unitarians, Baptists, Wesleyans, Independents, &c. The free-school, endowed in 1707 and subsequently, had recently an income of 1144. a year, and at the date of the last inquiry, 30 boys were taught reading, writing, and arithmetic, 14 of whom were clothed and apprenticed, and 1 taught Latin. An almshouse for a master, 2 wardens, and 12 poor men and women, had an income of 2911. a year; and, exclusive of these, there is an almshouse for 4 poor women, and several minor charities. (*Digest of Charity Reports.*)

Yevvil was at one period celebrated for its woollen manufactures. But these appear to have been early superseded by the glove trade, the latter having attained to considerable importance in the town so far back as the middle of the 16th century. "At present the manufacturers are employed in making men and women's fine gloves; which pass in the retail shops as kid gloves, but are, in reality, made from lamb-skins imported from Italy, Spain, and Germany. These skins are mostly dressed into leather in Yevvil, in which place the manufacturers are leather dressers and large dealers in wool, as well as gloves. The quantity of gloves made in Yevvil, of all sorts, may be estimated at 300,000 dozens annually; and the number of men, women, and children employed in the place and the adjoining districts (spreading over 20 m.) amounts, perhaps, to 20,000." (*Hull's History of the Glove Trade*, 70, 71.)

The use of cotton and woollen gloves, and the importation of French and other foreign leather gloves, has of late years seriously depressed the trade of Yevvil; though, according to the statement in the appendix to the Municipal Corporation Report, about 70,000l. a year are said to have been paid as wages (in 1836) to persons engaged in the glove trade of the town and its vicinity, and that the town was increasing. Yevvil claims to be a bor. by prescription, its government having been till lately vested in a portreeve and 11 burgesses; but their authority was very circumscribed, and all the courts formerly held by the corporation have fallen into disuse. Market day Friday, when a good deal of butter, cheese, corn, &c., is sent into the town; and large quantities of the butter made in the surrounding district are purchased, and sent to London, to be sold as Dorset butter. Fairs, June 28. and Nov. 17., chiefly for farm stock. (*Parl. Reports; Hull's History of the Glove Trade*, &c.)

YEZD, a considerable city of Persia, in the E. part of which it is situated, about 250 m. E. by S. Ispahan. Its pop. has been variously estimated; but if the statement of Kinneir, who assigns to it 24,000 houses, be near the mark, it must certainly be one of the most populous cities in the empire. It is situated in a sandy desert, near a range of high mountains, and has a fort, but no other defensive works. Being at the point of union of the principal roads connecting Ispahan, Kirman, Meshed, and Herat, it is consequently a considerable emporium. Its bazaar is said to be well supplied with provisions; though, from the sterility of the adjacent country, its supplies of corn have, for the most part, to be brought from Ispahan, and cattle are both scarce and dear.

The manufacture of silk stuffs in this city was, some years ago, superior to any other in Persia, and the village of Tuft, about 8 m. S.W., was equally famous for its *numuds*. Here, also, are some fabrics of arms and sugar refineries. Formerly a good many Hindoos were settled in the town, but these were driven away by the exactions of a late Persian governor: it has still, however, numerous families of Parsees (Guebres, or fire-worshippers) among the pop., this being almost the only town in the Persian dominions where they are now met with. Though an oppressed, they are an exceedingly industrious people. (*Kinneir's Pers. Emp.*, 113, 114; *Dict. Géog.*, &c.)

YONNE, a dep. of France, reg. centre, formerly comprised, for the most part, in Champagne and Burgundy, principally between lat. 47° 30' and 48° 30' N., and the 3d and 4th degrees of E. long., having N.W. the dep. Seine-et-Marne, N.E. Aube, E. Cote d'Or, S. Nièvre, and W. Loiret. Area, 728,747 hectares. Pop., in 1836, 352,487. Surface, undulating; the hills scarcely any where rising to more than 690 ft. in height: the most elevated are in the S.W., separating the basin of the Seine from that of the Loire. The Yonne, whence the dep. takes its name, rises in Nièvre, near Châteauneuf-Chinon, and runs generally northward to the Seine, which it enters at Montereau; in the dep. Seine-et-Marne, after a course of about 177 m.; for 70 of which, or as high as Auxerre, it is navigable. It traverses the dep. of Yonne nearly in its centre, receiving within its limits the Cure, Serain, and Armançon from the E.; its tributaries from the opposite side, being inconsiderable.

It communicates with the Loire by the canal of Nivernais; and with the Saône by that of Burgundy. A great part of the soil is calcareous, or gravelly, but about 300,000 hectares are said, in the *Official Tables*, to consist of rich land; and more corn is grown than is required for home consumption. In 1841, the arable lands were estimated to comprise 453,100 hectares; meadows, 31,265 do.; vineyards, 37,543 do.; and woods, 146,570 do. Hugo estimates the annual produce of corn, mostly wheat and oats, at 2,060,000 hectolitres, and that of wine at 1,110,000 do. The growths of this dep. are known as those of Lower Burgundy; the red wines of Tonnerre and Auxerre are especially esteemed; and the secondary growths of Epineuil, Irancy, &c., are also in high estimation. Chablis, the best of the white wines, is served up by the French epicures with oysters. Wines of this class *sont spiritueux sans être trop fumeux, ont du corps, de la finesse, et un parfum très agréable*. The consumption of the dep. does not exceed 250,000 hectolitres, the rest being mostly sent to Paris, the N. of France, and foreign countries, little brandy being made. The orchards, which comprise nearly 6,000 hectares, are of importance; and Yonne, along with Loiret, supplies Paris with all the *raisins* consumed by its inhabs. Fewer cattle and sheep are reared in this than in any other part of the central depts. The forests abound with game, and produce great quantities of charcoal, the trade in which is extensive. Iron, marble, lithographic and many other kinds of stone, gun flints at Cerrilly, lime, and clay, are the principal minerals. Bricks and tiles are made in large quantities, and glass, earthenware, &c., in various places. The manufactured products include, woollen stuffs and yarn, blankets, serges, &c.; beetroot sugar, paper, glue, &c.; hydraulic clocks made at Sens, barrels at Avallon, &c. The chief trade of the dep. consists in the export of its wines, corn, timber, and other agricultural produce. In 1835, of 190,786 properties subject to the *contrib. foncière*, 108,342 were assessed at less than 5 fr., and 28,578 at from 5 to 10 fr.; the number of those assessed at 1,000 fr. and upwards, amounted to only 161. Yonne is divided into 5 arrondis.; ch. towns, Auxerre the cap., Avallon, Joigny, Sens, and Tonnerre. It sends 5 mems. to the Ch. of Dep. Number of electors, in 1838-39, 1,839. Total pop. rev. in 1831, 11,344,924 fr. (*Hugo, art. Yonne; Dict. Géog.; French Offic. Tables.*)

YORK, a marit. co. of England, being by far the largest and most important in that part of the U. Kingdom, is bounded on the N. by the co. Durham, E. by the North Sea, S. by the co. of Lincoln (from which it is separated by the Humber), Nottingham, and Derby, and W. by Lancaster and Westmoreland, and a small part of Cheshire. Area, 3,669,510 acres, of which about 2,500,000 are supposed to be arable, meadow, and pasture. It is divided into the districts of the North, East, and West Ridings, being respectively as large as co., and each of them having its particular lord lieutenant; there is besides a separate smaller district called the city of York and Ainsty; but the latter, except in so far as the city is concerned, has been united to the W. Riding. The extent, population, &c., of these different divisions are as follows:—

	Area, Acres.	Inhab. Houses, in 1811.	Population in 1841.
North Riding	1,275,820	42,409	301,662
East Riding	711,360	38,290	195,676
West Riding	1,682,890	226,473	1,154,221
City and Ainsty	58,440	7,710	38,322
<b>Totals</b>	<b>3,669,510</b>	<b>315,882</b>	<b>1,591,584</b>

Owing to its extent and various capacities, Yorkshire presents an epitome of the whole kingdom with respect to surface, soil, products, and industry. Some of the mountains on its W. border, are among the highest in the great central ridge extending from Scotland S. to the middle of Derbyshire; and both there and in its N. division are very extensive tracts of high, sterile, moor ground. In the E. Riding a large tract of wolds extends from Flamborough Head to Fyling Head, on the coast, to Pocklington and Market Wighton; but, notwithstanding these deductions, Yorkshire contains a great extent of the most excellent land. The vale of York, the district of Cleveland in the N. and that of Holderness in the S.E., besides various other extensive tracts in different parts of the co., are exceedingly fertile, possessing soils suitable for every purpose, either of arable or stock husbandry. The climate is as various as the soil and elevation; but, except on the high grounds, it is mild and early, and is everywhere salubrious, except on the low, marshy grounds along the Humber. Agriculture in a medium state of improvement; not so far advanced as in Northumberland or Lincoln, but not so backward as in several other cos. There is in this respect, however, a great difference in the different ridings, agriculture being in a much more advanced state in the W. riding than in either of the others. The usual rotation is there—1st, turnips or fallow; 2d, barley; 3d, seeds; 4th, wheat. Bone manure is much

used, but not to so great an extent as rape-dust; the latter, however, is principally used for wheat, the bone manure being decidedly superior for turnips. Drainage is too much neglected in the N. and E. ridings. In the latter no system is acted upon, except in the Wolds, where the rotation is—1st, turnips; 2d, barley; 3d, seeds; 4th, wheat. In other parts of this riding, and in the N. riding, two corn crops not unfrequently follow in succession, and but few operations are performed as they ought to be. (*Kennedy and Grainger, i. 367.*) York is more of a grazing than of an agricultural co. Vast numbers of horses are bred in most parts. Those in the highest estimation are called Cleveland bays, partly from the district in which they were originally found in the greatest perfection, and partly from their colour; but they are now very widely diffused. They are in extensive demand as carriage-horses. Cattle very various; they consist mostly of the long-horned breed; but there are considerable numbers of short horns, with various varieties produced by crosses between these and other breeds. At present, the Teeswater and Holderness breeds are the greatest favourites with the graziers; but the long horns, or a cross between them and the short horns, are preferred by the dairy farmers. Yorkshire supplies most of the cows used in the London dairies. Their average yield of milk may be estimated at from 22 to 24 quarts a day, but it does not yield a proportional quantity of butter. Sheep of all varieties, and stock very large, supposed to amount to about 1,200,000 head, producing annually about 28,000 packs of wool. Mapp hogs are kept, and Yorkshire hams are celebrated in all parts of the country. Property in the W. and N. ridings very much subdivided; but in the E. riding it is less subdivided than in most parts of England, and many families in this riding have held their estates for centuries. Farms of all sizes; but the majority seem to be unusually small. Most part of these farms are held from year to year, or by tenants at will; and, notwithstanding the statements that have been made to the contrary, we have no doubt that this species of tenure, by diminishing the security of the farmer, has operated in no ordinary degree to retard the progress of improvement. Farm-houses and buildings for the most part rather indifferent. Average rent of land, in 1810, 16s. 7½d. an acre.

The W. riding of this co. stands in the very first rank as a manufacturing district. Leeds, Bradford, Huddersfield, Halifax, and Wakefield are the great seats of the woollen manufacture; flax-spinning is extensively carried on at Leeds; and the hardware manufactures of Sheffield, &c., and in some departments, as that of cutlery, far surpass those of Birmingham. There are extensive iron-works at Rotherham; and, recently the iron-works at Yorkshire have made considerable progress. Their total produce in 1839 was estimated by Mr. Scrivenor at about 90,000 tons, though we incline to think that this is beyond the mark. Cotton manufactures have been established at Easingwold, and in some other parts of the W. Riding. The manufactures in the other ridings are but of trivial importance. The valuable beds of coal found in the vicinity of Leeds, Sheffield, Bradford, Wakefield, &c. have, no doubt, been the principal source of their prosperity. Besides coal and iron, Yorkshire has mines of lead, and veins of copper; alum works were established near Whitby in the reign of Elizabeth, and are still worked (*see WHITBY*); and there are in various places excellent limestones and freestone quarries. Principal rivers Ouse, Swale, Ure, Wharfe, Aire, Calder, Don, Derwent, Hull, and Esk; the waters of all these, except the last, being poured into the great estuary of the Humber. The canals, particularly in the W. Riding, are numerous, and some of them are of great importance; and the principal towns are now so connected with railways. The co. is divided into wapentakes and liberties, and contains 613 parishes. It sends 3 mems. to the H. of C., viz. 6 for the co., being 2 for each riding; 2 each for the city of York, and the bors. of Leeds, Sheffield, Hull, Beverley, Bradford, Halifax, Doncaster, Pontefract, Ripon, Knaresborough, Malton, Richmond, and Scarborough; and 1 each for the bors. of Huddersfield, Whitby, Wakefield, Northallerton, and Thirsk. Registered electors for the N. Riding, in 1839-40, 11,911; for the E. Riding, 7,496; and for the W. Riding, 30,122. Sum expended for the relief of the poor, in 1839, N. Riding, 53,642l., E. Riding, 67,539l., W. Riding, 290,204l. Total value of real property assessed to the poor, in 1840-41, N. Riding, 1,011,985l., E. Riding, 1,111,807l., and W. Riding, 3,324,802l. Total amount of money *paid* for poor-rates for the co. during the year ended Lady-day, 1844, 468,947l.

YORK (an. *Eboracum*), an ancient and celebrated city of England, being, under the Romans, the cap. of Britain, and at present the second city of the kingdom in respect of rank, though not of importance. It is a county of itself, and a parl. and mun. bor., locally situated near the centre of the co. York, of which it is the cap., at the junction of the N., E., and W. Ridings; on the Ouse, at the confluence of the Foss,

22 m. N.E. Leeds, 33 m. N.W. Hull, 170 m. N.N.W. London, and 160 m. S.S.E. Edinburgh. Lat.  $53^{\circ} 57' 45''$  N., long.  $1^{\circ} 4' 34''$  W. The area of the old par. bor. and city comprised 2,720 acres, and had in 1831 a pop. of 25,260. But by the late act, some additions were made of parts of the townships of Clifton and Heworth on the N., and of Fulford on the S.E., to the par. bor., which is nearly co-extensive with the mun. bor., comprising, in part or wholly, 35 parishes, with some extra-parochial districts.

The city is inclosed by its ancient walls, supposed to have been erected by Edw. I., about 1280: they are flanked with numerous towers, and having been repaired and renovated in 1831, form a most delightful promenade, extending round the greater part of the city. They are pierced by 5 principal gates, termed bars, and by 5 smaller gates, or posterns; some of the former being remarkable structures. The Ouse and the Foss traverse the interior of the city, uniting at its S. extremity. The Foss is crossed by 4 bridges, and the Ouse by a single bridge, a handsome structure of 3 arches, constructed between 1810 and 1820, at a cost of 80,000*l*. The span of the central arch is 76 ft., that of the other arches 65 ft. each; the total width of the bridge within the parapet is 40 ft. Handsome flights of steps at each end conduct to spacious quays on both sides the river, called the King's and Queen's staiths, to which vessels of 90 tons may be moored.

York consists of several parallel lines of thoroughfare, running N. and S., crossed by others, which are generally shorter and more irregular, in an opposite direction. The principal of the former, nearly 2 m. in length, consists of Bootham, Petergate, Colliergate, Walmgate, &c., with their continuations. The line crossing it, and composed of Micklegate, Ousegate, Pavement, St. Saviour's-gate, &c., is almost as long. In the centre of the city is a fine broad open space called Parliament Street, terminating at one end in Sampson Square; and at the other end in the Pavement, the site of the corn, poultry, and other markets; and wool and leather fairs are held in Fosseholme Green, an open space in the E. part of the city. There are a few other open spaces in the heart of the city, as St. Helen's Square, &c., but none of them deserves any particular notice. York has been much improved and modernized of late years, but it still preserves an air of antiquity in its narrow streets and old-fashioned houses. Many of the latter formerly overhung the streets, the upper stories projecting beyond the lower; but a good many of these have been taken down, and buildings in a modern style have been erected in their stead. Some of the streets also have been widened, and the city generally is well paved, and lighted with gas. In consequence of the rise of Liverpool, Manchester, &c., the increasing importance of many of the large towns of Yorkshire, and the greater facilities of communication between the different parts of the kingdom, York no longer enjoys that pre-eminence in the N. she possessed in the earlier part of last century. Still, however, she is not declining in any respect; but, on the contrary, increases in size. In the outskirts many substantial and even superior buildings have been recently erected; and the city is extending itself nearly in an equal degree in almost all directions. To the N.E. of the town was formerly an open space known by the name of Heworth Moor. In 1817 this was enclosed; and in this neighbourhood a great number of substantial and excellent houses have been built since the period of the enclosure. Here also many market gardens are cultivated; and altogether the district is thriving and populous, and presents undoubted testimony of progressive and prosperous industry. (*Bound. Report*.) On the W. of the Ouse along the road from Leeds to the "Micklegate" are several good houses, many of which have been recently built, and are occupied chiefly by persons who have either retired from business, or are engaged in business in the older part of the town; the number of these houses is constantly increasing. The parishes beyond the Foss, through which the road to Hull passes, contain for the most part a pop. of a poor description." (*Mun. Corp. Rep.*)

York minster, or cathedral, is the finest edifice of its kind in the kingdom. It stands in the N. part of the city, and, except on its N. side, where a considerable space of ground has been cleared, is closely hemmed in by mean-looking buildings. The present edifice, said to have been raised on the site of a church originally founded by Edwin king of Northumberland, in the 7th century, was principally erected during the 13th and 14th centuries. It is without cloisters, and built in the form of a cross; consisting internally of a nave with two aisles; a transept, with aisles and a lantern in the centre; a choir, with aisles, and vestries or chapels on the S. side; and a chapter-house, with a vestibule, on the N. side. Its principal measurements are as follow:—length, internally, 624*½* ft. (being greater than that of any other cathedral in England, except Winchester); internal length of transept, 222 ft.; length of nave, 264 ft.; do. of choir, 131 ft.; height of both, 99 ft.; breadth of nave, 109 ft.; height of

great tower, 234 ft.; height of W. towers, each 106 ft. (*Stranger's Guide to York*, p. 103.)

This magnificent structure has a portion of all the styles of English architecture; but the Norman only appears in a fine crypt, under a part of the choir, which reduces the general appearance to the three later styles; of these, the transepts are early English; the nave and arches supporting the great tower are decorated; and the choir and upper part of the great tower are perpendicular. (*Rickman's Gothic Architecture*.) The W. front has been compared to that of the cathedral of Rheims for richness, sublimity, and beauty of architectural design. It is divided into 3 compartments, by 2 massive graduated buttresses enriched on every face with tabernaculic work, and the elevated battlemented gable is covered with ornamental tracery of the most florid kind. There are 3 entrances in this front; over the central of which is the unrivalled W. window, divided into 8 portions by upright mullions, which in the upper part beautifully diverge into the leafy tracery peculiar to the 14th century. The magnificent towers which flank this side exactly correspond; they are supported by buttresses, and have at their summits 8 crocketed pinnacles connected by a battlement. Almost the whole of the W. front is filled with niches, but these, with few exceptions, are empty. The S. side, though finished less elaborately than the W. front, is very imposing. The porch in the S. transept is the most usual entrance to the church, and is deeply recessed by numerous mouldings; over it is a beautiful maynord window, and the gable is surmounted by an enriched pinnacle. The N. side is in a similar style to the S., though finished in a plainer manner; and in its transept is the remarkable stained glass window termed the "five sisters." The E., like the W. front, is in three grand divisions, separated by buttresses, the central of which is wholly occupied by a magnificent window. Like the W. front also, it is covered with niches, though only a very few of the statues formerly occupying them now exist. On this front the influence of time is very perceptible. The central tower, 234 ft. in height, is probably unfinished. It has two large windows, with two tiers of mullions, in each of its four sides. But it wants a spire; and when contrasted with the W. towers, has a heavy appearance.

The interior of the minster corresponds in beauty and grandeur with the exterior. A careful restoration of the cathedral in most of its parts had been completed, when, on 2d February, 1829, it was set on fire by a lunatic; the conflagration thence ensuing destroyed the fine organ, and all the woodwork and roof of the choir. Another destructive fire broke out on the 20th of May, 1840, in the S.W. tower, by which its fine ring of 10 bells and the clock, with part of the roof of the nave, were burnt. These injuries are now (1842) in the course of being completely repaired: the choir was renovated after the fire of 1829, under the superintendence of Sir R. Smirke. The new roof is wholly constructed of teak, presented by government; and is covered with lead procured from the mines of the Greenwich hospital estates. The remarkable stone screen, which separates the choir from the nave, stands in its original position, and is of a most gorgeous and florid style, ornamented with 15 statues of the kings of England, from William I. to Henry VI., all of which, except the last, are of ancient sculpture. The new organ placed above this screen, and presented by the late Earl of Scarborough, is of the most superb description, and has some pipes 32 ft. in length. A great deal of fine stained glass, many sculptured coats of arms, and the tombs of many of the archbishops of York, attract the visitor's notice in the interior; though, on the whole, this cathedral is less rich in monuments than many others in the kingdom. From the N. transept, a vestibule leads to the chapter-house; this is an octagonal building, 63 ft. in diameter, and 67 ft. 10 in. in height, supported on the outside by eight massive buttresses. "The more minutely," says Rickman, "this magnificent edifice is examined, the more will its great value appear. The simplicity and boldness, and at the same time the great richness of the nave, and the very great chastity of design and harmony of composition of the choir and great tower, render the building none completely one whole than any of our mixed cathedrals; while the exquisite beauty of the early character of the chapter-house, and its approach, forms a valuable link to unite the early English transepts and the decorated nave. This chapter-house is by far the finest polygonal room without a central pier in the kingdom, and the delicacy and variety of its details are nearly unequalled. Too much praise cannot be given to the dean and chapter for their careful restoration of every decayed portion. By this restoration the whole of the W. front may be considered in as good a state as when first erected; a considerable portion of the S. side is also restored." (*Gothic Architect*, p. 265.) The vestries on the S. side of the church contain, among many other antiquities, a chair in which several of the Saxon kings were crowned.

and which is said to be older than the cathedral itself; and the drinking horn of Ulphus, a Saxon prince of Deira, presented to the cathedral in 1036, with a large extent of country to the E. of York, still in the possession of the see. The library is at a short distance from the cathedral on the N. side. (*Winkie's Cathedrals; Guild to York; &c.*)

The gross annual income of the see of York amounted, at an average of the three years ending with 1831, to about 13,900*l.*, and the net income to 12,623*l.* The chapter consists of a dean and four canons residentiary, sharing an income of 1,362*l.* a year, and 36 prebendaries having separate revenues. (*Eccle. Rev. Report.*) The archb. of York has the title of primate of England, with the privilege of crowning the queen-consort, and ecclesiastical authority over the province of York, comprising the sees of York, Durham, Carlisle, Chester, Ripon, and Sodor and Man.

Previously to the dissolution of the religious houses by Henry VIII., besides 17 chapels, 16 hospitals, and 9 religious houses, there were in this city 41 par. churches, but of these last only 23 now remain. Many of these would be worthy of notice elsewhere; but they sink into insignificance after the cathedral. St. Michael-le-Belfrey, in the minster-yard, is the largest and most elegant, and with St. Martin's in Coney St. is in the late perpendicular style. All Saints, North Street, and St. Mary's, Castle-gate, have towers and lofty spires, and are mostly perpendicular with some earlier portions; St. Denis, St. Lawrence, and St. Margaret, have good Norman doors, with portions of later date; and St. Mary Bishop-hill, the Elder, has portions of good early English and decorated work, amidst various alterations and insertions. In many of the churches are considerable quantities of old stained glass. (*Rickman, p. 295.*) All Saints in the Pavement is of very ancient foundation; and Drake says that its N. side is almost wholly built out of the ruins of *Eboracum*, though other parts of the edifice are quite modern. A large lamp still preserved here used to be hung at the summit of this building, as a beacon for travellers at night through the forest of Galtres, which extended from Bootham-bar a considerable distance N. of the city. Most of the livings of these churches are rectories or vicarages in the gift of the crown or the dean and chapter of York; the most valuable are those of St. Cuthbert, worth 233*l.* a year nett, and St. Mary Bishophill, the Elder, worth 226*l.* a year, both in the gift of the crown; St. Martin's, Micklegate, worth 243*l.* a year, is in the gift of a private family. (*Eccle. Rev. Rep., &c.*)

The remains of St. Mary's Abbey, originally founded by William Rufus in 1083, and refounded in 1270 for black monks of the Benedictine order, are very interesting. The abbot was mitred, and had a seat in parliament; and at the time of the dissolution the revenues of the abbey amounted to 2,085*l.* 1*s.* 3*d.* a year. The buildings were for the most part destroyed, between 1701 and 1717, and their materials used for rebuilding the castle of York and St. Olave's church, and repairing Beverley minster. Almost the only parts remaining are a gateway, and the N. wall of the abbey church, 371 ft. in length, having fine light Gothic window-arches, with highly finished carved capitals. Mr. Rickman says that the remaining part of the church furnishes the richest and most beautiful specimens of transitions from early English to decorated that remain for examination; but being entirely exposed, it is fast decaying. The abbey had an extensive and strongly fortified precinct without the ancient walls of the city; and some of its walls and towers, forming an extraneous portion of the old city defences, may still be seen between Bootham-bar and the Ouse. The remains of St. William's College, founded by Henry VI., exist in a street near the cathedral. St. William's chapel stood on the old bridge over the Ouse, and was consequently taken down with that structure. The cloisters of St. Leonard's and St. Peter's hospitals, curious remains of the architecture of the time of Will. I. & II., are now used as wine vaults.

The dissenters, who form a numerous and respectable body in York, have at least a dozen places of worship; the oldest of which is the Presbyterian (Unitarian) chapel, in St. Saviour-gate. The Wesleyans have an elegant new chapel in the same street, with a massive Ionic portico, &c., besides three other chapels. The Independents have 2 chapels, one of which (Salem Chapel), erected at the end of St. Saviour Gate, is a large and handsome edifice. There are also meeting houses for Primitive and other Methodists, and Friends; a fine R. Cath. chapel, a nunnery, and chapel outside Micklegate-bar, &c.

York Castle, towards the S. extremity of the city, between the Ouse and Foss, near their confluence, occupies a space of nearly 3 acres. It was originally built by William the Conqueror, who also erected another fortress, at York, on the other side of the Ouse. But only a small portion of the original structure of the castle remains, except Clifford's Tower, a keep added

by the Conqueror to the rest of the edifice, and erected upon an artificial mound, which had probably served for the site of a Roman fortress. York Castle, which was long garrisoned for the king in the civil wars, is not now a defensive military post, but has been converted into the co. prison and hall. The basilica, or co. hall, on the W. side of the great area, is entered by a portico, supported by Ionic columns, and internally divided into civil and criminal courts, with handsome rooms for the use of the grand and petit juries, counsel, &c. The building, on the E. side of the area, which is uniform in design with the court-house, is chiefly appropriated to female prisoners. Between 1821 and 1836, a new prison was built here, at an expense of 203,530*l.*, on the panopticon principle, with 8 airing courts, the whole being surrounded by a lofty stone wall, 35 ft. high. This building is said to be most excellent of its kind. In 1838-39, the commitments to York Castle amounted to 632. (*Gen. Returns, 1840.*) The city gaol and house of correction is on the W. side of the Ouse; its outer wall encloses an area of nearly three fourths of a mile in circuit: it is appropriated partly to prisoners before trial. Near it is the *vetus ballium*, or old baile, a mound corresponding with that on which Clifford's Tower is built, having probably had the same origin and purpose.

Most of the other edifices, of public interest, are in the N. part of the city. The mansion-house, a large and handsome edifice, erected in 1725, has in front a rustic basement supporting an Ionic colonnade, with a pediment on which are the arms of the city. The state-room, 43*ft.* in length by 27*ft.* in breadth, has paintings of Will. III., Geo. II. and IV., and of several noblemen and gentlemen. The guildhall, behind this edifice, built in 1446, comprises one of the finest Gothic halls in the kingdom, 96 ft. in length, 43 ft. in width, and 29*ft.* in height, the roof being supported by 10 octagon pillars on stone bases. In the windows are some fine specimens of stained glass, and over the entrance is a full-length statue of Geo. II. In this hall, the Lords-president of the North formerly held their court; and here also the Scotch received the 200,000*l.* paid them by Parliament for the assistance they afforded against Charles I. At the end of the hall is the city assize and sessions court; and adjoining, are the council chambers of the corporation. The assembly-rooms were erected, by subscription, in 1730, and are entered under a portico, resting upon light stone columns, supporting a ballustrade. The walls are supported by 44 light and elegant Corinthian columns, with a beautiful cornice, the upper part of the building being of the Composite order, and richly adorned. The rooms are lighted by 44 windows. The grand assembly-room is constructed from a design by Palladio, and measures 112 ft. by 40 ft., and 40 ft. in height. It was used for concerts till about 1825, when, being found too small, a magnificent concert-hall adjoining was built, 95 ft. in length, 60 ft. in breadth, and 45 ft. in height, capable of containing 1,700 persons, 400 being accommodated in a gallery supported by cast-iron pillars. It is lighted with gas, and fitted up in a style of much elegance: its cost, including the purchase of the ground, amounted to 9,400*l.* The theatre, built by Tate Wilkinson, in 1765, and recently altered externally in the Elizabethan style, is extremely commodious. The Yorkshire Philosophical Society, founded in 1822, obtained, in 1826, a grant of 3 acres of land, part of the site of St. Mary's Abbey, from government, for a public building, botanic garden, &c. The Museum, built between 1827 and 1830, is an elegant edifice, with a front towards the Ouse, 200 ft. in length, and has a spacious hall, a library, a theatre for lectures, with large collections in geology, mineralogy, zoology, comparative anatomy, a chemical laboratory, &c. The affairs of the society are conducted by a council of 12 members, and officers elected once a year. Annual subscription of members 2*l.* (ladies, 1*l.*), with 5*l.* entrance. The York Subscription Library, with 17,000 vols., occupies a spacious suite of rooms in St. Leonard's Place: it is supported by about 400 members, who pay 10 guineas each on entrance, and 2*s.* a year afterwards. There are other subscription, and several good private circulating libraries, with 3 news-rooms, at which the London, Edinburgh, and many provincial newspapers are taken in. Four weekly newspapers are published in York.

Outside Monk-bar is the county hospital, founded in 1749 by Lady Hastings, with (in 1842) an income of about 1,400*l.* a year. The building has a front of 75 ft., by a depth of 90 ft., and encloses a court measuring 26 ft. by 35 ft. It is remarkably well kept, and capable of accommodating 100 patients. Without Bootham-bar is a lunatic asylum, built by subscription in 1777, 3 stories in height, having a front 132 ft. in length, with extensive grounds, &c., and about 1 m. from the city is the Retreat, an establishment of a similar nature under the careful management of the society of Quakers. Here, also, is a dispensary, founded in 1788; an eye infirmary, established in 1831, and various medical and other charities for the benefit of the poor. The educational establish-

ments are on a very extensive scale, at least in so far as elementary and the more ordinary branches of instruction are concerned. A *masters' school*, in connection with the York Diocesan Society, occupies the extensive premises in Monkgate, formerly used as the Unitarian college. This last, the chief seminary of the Unitarians in England, was removed from Manchester to York in 1803, but has lately been again removed to Manchester. Here also are national schools, established in 1812, in which above 700 children of both sexes are educated; British schools for about 200 boys and 300 girls; the blue coat boys and grey coat girls' schools, established in 1708, having an income of about 1,500*l.* a year; Haughton's charity school, for the education of 20 poor children of the par. of St. Crux; the spinning school, established by two ladies in 1782, where about 60 girls are instructed in reading, knitting, and sewing, and principally clothed; with Sunday schools, &c.

The cavalry barracks on the Fulford road, the manor-house at different times a royal palace and mint, and Bishopthorpe palace, the seat of the archbishop, about 3 m. S.E. from the city, are the principal edifices which remain to be noticed. The grounds of the last are frequently resorted to in summer by the inhabs., whose principal public promenade in the city is the New Walk, a gravelled terrace planted with elms, &c., extending from the neighbourhood of the castle for nearly 1 m. along the Ouse. Near the New Walk is a cold-bath; and hot, cold, and vapour-baths are established in Lendal for the accommodation of the public at large. Swimming baths have also been recently erected.

The city of York claims to be a corporation by prescription. Its earliest extant charter is one of Henry II., without date; but its governing charters before the Municipal Reform Act were of the 16th Charles II. and the 10th Geo. IV. By the latter, the corporation officers were the mayor, 12 aldermen, the 2 acting and the former sheriffs, the recorder, city counsel, town clerk, coroners, 72 common councilmen, &c., who sat, as in London, in two separate courts. All the corporate officers were freemen, the freedom of the city being acquired by birth or apprenticeship to a freeman within the city liberty, and by gift or purchase from the upper house, the price of purchase varying from 2*5*l.** to 150*l.* Under the Municipal Reform Act, the bor. is divided into six wards, and is governed by a mayor, recorder, 12 aldermen, and 36 councillors, 6 from each ward. The chief magistrate has the title of Lord Mayor conferred by Richard II., in 1389, which title he consequently enjoyed before the chief magistracy of the metropolis. York sent 2 members to the H. of Com. in the 49th of Hen. III., and has continued to do so regularly from the time of Edw. I., the right of election having been formerly vested in the corporation and freemen. The greatest number of voters within the 30 years previously to the Parl. Reform Act, was 3,715, polled in 1830. Reg. electors in 1839-40, 3,326. The election for the N. riding of the co. of York is held here. Courts of assize for the co. and the city are also held here twice a year besides quarter sessions, a court of pleas, and petty sessions twice a week; and there were formerly several other courts, now obsolete. (*Mun. Rep., Appendix, iii.*) Corp. revenue, in 1840, about 3,000*l.* The corp. of York had exclusive jurisdiction over the Ainsty, a large district comprising about 35 towns and villages, from the time of Hen. VI. till a late act annexed the Ainsty to the W. riding of the co.

Under the Romans York was, no doubt, the commercial emporium of the N. part of the island, and it appears to have been a city of some commercial importance in the time of Edw. III., who established a woollen manufacture in the city, which continued to flourish for a lengthened period. At present its trade is comparatively small for its size; and the largest amount of capital now employed in any one branch by the citizens is supposed to be in the drug trade. Considerable business has, however, been done lately in the iron trade, and there are several large foundries: printing, brewing, and comb making are also extensively carried on. The glass manufacture was established at York at a somewhat early period; and phials and flint glass wares are still made here. Linen cloth, sack, twine, leather, gloves, jewellery, paper-hangings, fringe, musical instruments, brass wares, tobacco pipes, &c. are among the other goods made at York. Many guilds or trading companies formerly existed, but all of them except three appear to be dissolved. The Company of Merchant Adventurers of York is an ancient corporation by prescription, now consisting of about 120 members, under a governor, deputy governor, &c., having property yielding 200*l.* a year, with a chapel and hall, and a hospital, in Fosgate. The Merchant-Tailors' Company, incorporated by charter 14 Chas. II., consists of from 30 to 35 members, with exclusive privileges in the city, and an income of 136*l.* a year. The other company is the Goldsmiths', authorised by act of parliament. The Ouse trustees have lately spent large

sums on the improvement of the river navigation; and steamers now ply to and from Hull at all times of the tide. Coals are brought to the town by water and by railway. A decided increase of trade has been experienced since the completion of the Railways, by which York communicates with Newcastle, Durham, Carlisle, &c. northward, and with Leeds, Hull, the Liverpool lines, and other parts to the S. The York station of these railways is an elegant building, immediately within the walls near Micklegate. Large sales of cattle and horses take place at fairs held here once a fortnight, besides which there are monthly fairs for leather; many others in the year for flax, wool, &c. Markets, Tuesd. and Sat., the latter chiefly for corn. A new cattle-market was opened in 1828 outside Fishergate. Races, which are extremely well attended, are held three times a year on Knavesmire, a large plain about 1 m. S. from the city, where is a spacious grand stand. Four joint-stock banking companies and two private banks are established in the city.

The society of York is superior to that of most provincial towns. From its being the capital of the most extensive co. in the kingdom, it is the residence of a great number of gentlemen connected with the law and the administration of public affairs. It is necessarily, also, the residence of a number of gentlemen connected with its cathedral and different ecclesiastical establishments. And in addition to its fixed inhabs., it is the winter residence of many of the provincial gentry attracted hither by its superior society, amusements, facilities for education, &c.

*Antiquities and History.*—York, though successively the residence of Hadrian, Severus, Geta and Caracalla, Constantius Chlorus, Constantine the Great, &c., has few striking Roman antiquities. Such as do exist comprise a remarkable multangular tower, a long wall, with altars, *puteæ*, tombs, monuments, and the foundations of ancient buildings. The *palatium* of the Roman emperors is supposed by Drake to have occupied several acres near the cathedral, extending from Christ Church through all the space between Goodragrade and St. Andrewgate to Aldward. Not far from this, in St. Cuthbert's cemetery, many Roman sepulchral remains have been found. Outside Micklegate-bar, a Roman vault, with a perfect skeleton, was opened in 1807; and a tessellated pavement was discovered within the same bar in 1814. Severus died at York A.D. 212; and his funeral obsequies would appear to have been performed on some heights a little W. of the city, still called Severus's hills. Constantius, who died in 307, is traditionally said to have been buried in the par. church of St. Helen's. Under the Saxons, York was successively the cap. of the kingdoms of Northumberland and Deira. It was taken, and its neighbourhood devastated by William the Conqueror in 1069. Several parliaments have been held in York, the first being that summoned by Henry II. in 1160. In 1540, Henry VIII. established in this city an officer called the Lord President of the North, and a council with very extensive powers, which existed till the civil wars, when York was frequently a principal station and residence of Charles I.; it, however, surrendered to the parliament in 1644. (*Bound., Music, and other Parl. Reps.; Butler's Guide to York; Rickman's Archit. in England; Private Information, &c.*)

York, a town of the U. States, Pennsylvania, cap. co. York, on a creek flowing into Chesapeake Bay, and on the railroad between Harrisburgh and Baltimore, 40 m. N. by W. the latter. Pop. in 1840, 4,779. It is an agreeable and flourishing town, in a rich agricultural district. It is constructed mostly of brick, and has some good buildings, including numerous churches, an episcopal academy, court, market, and almshouses, &c. Its trade is chiefly in agricultural produce.

YOUGHALL, a parl. bor. and sea-port town of Ireland, prov. Munster, co. Cork, on the W. side of the estuary of the Blackwater, immediately within its mouth, 27 m. E. by N. Cork. Area of modern parl. bor., 212 acres. Pop. in 1831, 9,600. It is built close to the water's edge, along the foot of a pretty steep hill, and consists principally of a main street, extending for about 1 m. parallel to the strand, and of various other smaller streets and lanes. It was formerly surrounded by walls; and these in part remain, and form, on the summit of the hill to the W., the boundary of the town. Of 1,200 houses comprised within the parl. bor. in 1831, 1,000 were slated, and 200 thatched; the greater proportion of the latter are in the suburbs, which are "large and bad," extending in every direction up the hill. The principal public building is the parish church, a large Gothic edifice: in its immediate vicinity are the ruins of an old abbey, one of the windows of which "is extremely beautiful, and quite entire. The churchyard, too, is one of the largest and finest, in point of situation, I have ever seen. It is interspersed with lime and other trees; and, like every thing else about Youghall, has many remnants of antiquity, old tombs, old lived moss-grown stones,

and luxuriant woods." (*Inglish*, i. 178.) It has, also, a chapel of ease, several Roman Catholic chapels, and meeting-houses for various classes of dissenters, an infirmary, a dispensary, a barrack for infantry, numerous public schools, a convent, the college, now in a neglected state, the property of the Duke of Devonshire, a court-house, custom-house, fever and lying-in hospitals, &c. The house occupied by Sir Walter Raleigh is still preserved in good repair, and with but little change.

Youghall sent 2 mems. to the Irish H. of C.; and it has sent 1 mem. to the Imperial H. of C. from the era of the Union downwards. Registered electors for 1833-40, 670. Under the Irish Municipal Reform Act, 3 and 4 Victoria, cap. 108., the corporate body is styled the mayor, bailiffs, burgesses, and commonalty of Youghall.

The manufactures of the town are inconsiderable, consisting only of 2 small potteries and brick-works. It is too near Cork to have much foreign trade; but owing to its situation on a fine navigable river, it is the emporium of a considerable tract of country. The great articles of export consist of grain and meal, provisions, cattle, and pigs, their aggregate value having amounted, in 1836, to 25,317*l*. The principal articles of import are timber and coal. The bar at the river's mouth has only 4 feet water at ebb tide, and it is inaccessible for vessels drawing more than 12 or 13 feet water, except at high springs. Youghall is included in the port of Cork, but its shipping is inconsiderable. Postage, in 1830, 1,144*l*; ditto, in 1835, 1,294*l*. Branches of the Bank of Ireland and the Provincial bank are established in the town. The beach is fine, and the town is well fitted for sea-bathing; though, in this respect, but little advantage has been taken of its capabilities.

It is believed, apparently on good grounds, that the introduction of the potato cultivation into Ireland dates from 1610, when Sir Walter Raleigh sent a few to be planted on his estate in the vicinity of this town! But such has been the progress of this exotic, that it now furnishes, and has for a lengthened period furnished more than three fourths of the food of the people of Ireland; and its astonishing increase has been at once a cause and a consequence of the equally astonishing increase of population in the island. (See *Boundary Report*; *Railway Report*; *Commercial Dict.*, art. *Potatoes*, &c.)

YPRES (Flem. *Ypern*), a fortified town of Belgium, prov. W. Flanders, cap. arrond. and two cauits., on the Yperlee, 29 m. S.W. Bruges, and 16 m. N.N.E. Lille; lat. 50° 51' 10" N., long. 2° 53' 44" E. In the 14th century it is said to have been nearly equal in pop. and importance to Bruges; whereas in 1836 it had only 15,064 inhabs. (*Heuschling*). It is well built, and, like most towns in Flanders, it has extensive water communications, being enjoincted by canals with Nieuport, Bruges, &c.

The court-house and cloth-hall occupy a vast Gothic building of the 14th century, surmounted by a fine tower. The cathedral, a Gothic edifice, has a painting attributed to Van Eyck; the tomb of Jansen, bishop of Ypres, and founder of the sect of Jansenists in the 17th century, &c. There are several other churches and chapels, 4 hospitals, an exchange, a royal college, &c. Ypres was formerly famous for its manufactures of woollen and linen cloths, and the fabric called *diaper* (originally *d'Ypres*) derives its name from having been originally made in this town. Linen yarn and lace are now the principal articles manufactured; but there are still some woollen and linen cloth factories at Ypres, with tanneries, bleaching and dyeing-houses, one or more salt-works, &c. Ypres experienced many reverses in the wars of the 17th and 18th centuries. Under the French it was the *cap. dep. l'ys*. (*Vandermaelen*, *Dict. de Fland. Occident.*; *De Cloet*, &c.)

YRIEX (ST.), a town of France, dép. Haute-Vienne, cap. arrond., on the Loue, a tributary of the Isle, 21 m. S.S.W. Limoges. Pop., in 1836, incl. comm., 6,900. It owes its origin to a monastery founded here in the 6th century; and is old and ill built. It has a collegiate church, a curious Gothic edifice of the 12th century, 4 other par. churches, an hospital, a court of primary jurisdiction, a society of agriculture, &c., with manufactures of woollen stuffs, linen yarn, and porcelain, and 12 annual fairs. Here are some iron works, and works for the preparation of antimony: all the porcelain clay used in the china-manufactory of Sèvres comes from St. Yrieux. (*Hugo*; *Guide du Voyageur*, &c.)

YSENBACH, a town of France, dép. Haute-Loire, cap. arrond., on a rocky and elevated site, 14 m. N.E. Le Puy. Pop., incl. comm., 7,621. Though irregularly built, and *assez triste*, it has a good modern church, and is improving. It has no manufactures worthy of notice, its inhabs. being principally engaged in agriculture and cattle-dealing. (*Hugo*, &c.)

YUCATAN, the most E. state of the Mexican Con-

federation, consisting of a peninsula, projecting northwards, between the Caribbean Sea on the E., and the Gulf of Mexico on the W., and between the 18th and 21st degs. of N. lat., and the 87th and 91st of W. long., having S. the states of Tabasco, Chiapa, Vera Paz, and the British territ. of Honduras; length, N. and S., about 250 m.; average breadth, 200 m. Area about 50,000 sq. m. The pop. has been estimated at about 500,000. The most striking accounts of the productiveness of this region have been frequently put forth in geographical works. But, according to Mr. Ward, "Yucatan is one of the poorest states in the Federation. On parts of it, maize, cotton, rice, tobacco, pepper, and the sugar-cane, are produced; with dye-woods, hides, soap, &c. But the scarcity of water in the central parts of the peninsula, where not a stream of any kind is known to exist, and the uncertainty of the rainy season, render the crops very variable; and years frequently occur in which the poorer classes are driven to seek a subsistence by collecting roots in the woods, when a great mortality ensues, in consequence of their exposure to a very deleterious climate. Yucatan has no mines. An active intercourse was formerly carried on with the Havannah, which Yucatan supplied with Campeachy wood, salt, hides, deer skins, salted meat, and the *jucquen*, a plant from which a sort of coarse thread was made, and wrought up into sackings, cordage, and hammocks. This trade was cut short by the war; and as few foreigners have been induced to settle in Yucatan, the inhabs. have derived but little advantage from the late change of institutions. The receipts of the state in 1826 amounted to 213,127 dollars, the expenditure was 207,199 do.; so that a small surplus revenue remained." (*Ward's Mexico*, ii. 390, 391.)

This state is divided into 15 dep., its chief towns are Merida, the cap., Valladolid, Bacalar, Campeachy, and Vittoria; but none is of much importance. In 1829, it separated itself for a time from Mexico; and we incline to think that at present (1842) it is but little, if in any degree, dependent on the central government.

YVERDON (Germ. *Ifferten*, an. *Ebrodunum*); a town of Switzerland, cant. Vaud, cap. distr., on the Thiele, at its mouth in the S. extremity of the lake of Neuchâtel, 17 m. N. by W. Lausanne. Pop. between 3,000 and 4,000. It is well-built, consisting of three principal streets, with a handsome square; a new church, and town-hall, several bridges across the Thiele, &c. Its principal edifice is a castle, built in the 12th century, and which, from 1805 to 1823, served for Pestalozzi's central school, conducted by himself. Yverdon has a college, a public library, with a museum of antiquities, and a tolerable harbour on the Thiele. Its trade is brisk, it being the great depot for the wine of the cant. exported northwards. (*Ebel*; *Dict. Geog.*, &c.)

YVETOT, a town of France, dep. Seine-Inférieure, cap. arrond., on the road between Havre and Rouen, 20 m. N.W. the latter. Pop., in 1836, ex. comm., 7,923. It is situated on a bare and arid hill, destitute of any running water, the inhabs. being supplied from wells. It consists chiefly of one long street; but is very meanly built, and houses, and the rest of the town, is very meanly built. It has, however, a planted promenade; and the surrounding country is fertile and populous. Yvetot is the seat of courts of primary jurisdiction and commerce, a chamber of manufactures, &c., and has manufactures of linen and cotton cloths, cotton velvet, handkerchiefs, hosiery, cutlery, and hardware. It has also a considerable trade in corn and sheep. Towards the end of the 13th century, the Spanish, Italian, and other merchants used to proceed from Harfleur to Yvetot, where they conducted their chief mercantile transactions with the French; and, perhaps in the view of encouraging commerce, the *Reef* of Yvetot was declared, in 1370, free of all feudal service to the French crown. Its lords soon afterwards coined their own money, and assumed the title of *king*. The exploits of one of these petty monarchs form the subject of one of Beranger's national songs. (*Hugo*, art. *Seine Inférieure*; *Dict. Geog.*, &c.)

YUTHIA, the an. cap. of the kingdom of Slam, on the Menam, 40 m. N. Bangkok: it appears to have been formerly a place of much magnificence, but it has now fallen into decay.

## Z.

ZAANDAM, improperly SAARDAM, a town of N. Holland, on the Zaan, a tributary of the Y, by which it is divided into E. and W. Zaandam, 44 m. N.W. Amsterdam. Pop. about 10,000. Mr. McGregor says, "We have only visited one place (Broek), so trim, quiet, and minutely clean. The streets are paved with clinkers, and daily washed; the houses are built of wood and painted white and green, and their principal door, that of ceremony, is only opened at baptisms, marriages, and funerals."

The dockyard, in which 300 vessels were built and repaired annually, have disappeared; its herring and whale fisheries have also vanished; but its vast number of windmills employed in sawing timber, &c., appear, with their dependent operations, to give full occupation to the inhabitants." (*Note Book*, i. 197, 198.)

At one period, Zaandam ranked among the greatest naval arsenals in Europe; but the principal celebrity of the arsenal, and, indeed, of the town, is derived from the circumstance of Peter the Great having wrought in it as an ordinary ship carpenter during his visit to Holland in 1697. The house which he occupied is still kept up, and has been visited by numerous distinguished personages, including Napoleon, Alexander, Emperor of Russia, &c. (*De Voet*; *Voltaire*, *Hist. de Russie*, partie i. cap. 9.)

**ZACATECAS**, a city of Mexico, cap. of the state of its own name; in a narrow valley, 230 m. N.W. Mexico. Ward estimates its pop. at 22,000, and that of its suburb, Yeta Grande, at 6,000. (*Mexico*, ii. 342.) As a distance, its numerous churches and convents give it a fine appearance, and it has many excellent houses; but its streets are narrow and filthy. Its markets appear to be abundantly supplied with fish, fruits, vegetables, &c. Gunpowder and some cotton fabrics are manufactured here; and Zacatecas is next to Guanajuato, the principal mining city, and one of the chief mints in Mexico. In the latter establishment, some years ago, 300 people were constantly employed. The machinery, of brass, and made in the town, was ponderous, and a great deal of labour was wasted; still, however, the coinage from Jan. 1821 to June 1826 amounted to upwards of 17,570,000 dollars.

The state of Zacatecas, with an area of about 20,000 sq. m., and a pop. of 280,000, is one of the richest mining provinces in America. "As a mining district, it differs materially from Guanajuato, in that it has no great mother vein, it has 3 lodes nearly equal in importance, with many inferior lodes; upon all which nearly 3,000 pits or shafts have been opened." (*Ward's Mexico*, ii. 333.) N. and E. of Zacatecas, the country is divided into vast breeding estates, and is very thinly peopled. The state has no manufactures, except those of the cap. and a few in Aguas Calientes; the pop. living by mining and rural industry. After the cap., the principal towns are Somburelli, Fresnillo, Jerez, Pinos, &c., which, according to Mr. Ward, have a pop. of from 14,000 to 18,000 each.

**ZAFRA** (an. *Sageda*), a town of Spain, in Estremadura, prov. Badajoz, 40 m. S.E. Badajoz, on the road between it and Seville. Pop. 7,500. (*Milano*.) It is regularly built, and has 2 squares surrounded with arcades, and many houses of a superior class. Among the latter is the magnificent residence of the Duke of Medina Celi. (See *Milano*, x. 58.) The collegiate church is also a fine edifice, and several other churches are richly adorned. This town had formerly manufactures of gloves and jewellery; but these have decayed, and earthenware and leather are now the principal articles made at Zafra. It was taken from the Moors by Ferdinand III. in 1240. (*Dict. Geog.*, &c.)

**ZAMORA**, a city of Spain, in Leon, cap. prov. of its own name, near the confines of Portugal on the Douro, here crossed, according to Twiss, by an ancient and clumsy stone bridge, with 16 unequal arches; 34 m. N.W. Salamanca. Pop., about 10,000. (*Milano*.) Its fortifications are of considerable extent, and some years ago enclosed upwards of 20 churches, 16 convents, 3 hospitals, infantry and cavalry barracks, a court-house, public granary, bishop's palace, &c. The cathedral was much admired by Townsend (ii. 71.), for its variety of marbles and the beauty of its hangings. Without the walls are the remains of an ancient castle. The inhabitants manufacture hats, serges, leather, liqueurs, and gunpowder, and have several dyeing-houses. The city, which is supposed to have been the ancient *Scutia*, derives its modern name from the turquoises found in its vicinity, for which *Zamora* is the Moorish term. Alphonso, the Catholic, took it from the Moors in 748, but it was retaken by the latter in 985. Ferdinand the Great finally annexed it to Castile in 1093, and it was the seat of the Cortes in 1267 and 1302. (*Milano*; *Townsend*; *Twiss*; *Dict. Geog.*, &c.)

**ZANESVILLE**, a town of the U. States, in Ohio, cap. co. Muskingum, on the Muskingum river, 48 m. E. Columbus. Pop. in 1840, 4,766. The falls in the river here have made Zanesville the seat of many flour, paper, and saw-mills, some iron-foundries, cotton-factories, &c. It has an Athenaeum, and several other schools. Two bridges connect the town with the village of Putnam opposite; and it has water communication with both New York and New Orleans; from either of which steam-boats ascend to Zanesville. (*Encyc. of Geog.*, Amer. edit., &c.)

**ZANTE** (an. *Zacynthus*), one of the Ionian Islands, (which see), of which it is the third in point of magnitude and importance, about 10 m. off the W. coast of the Morea, its cap. being in lat. 37° 47' 17" N.,

long. 20° 54' 32" E. It is of a somewhat oblong shape; greatest length N.W. to S.E. about 20 m.; greatest breadth 10 m. Area estimated at 156 sq. m. Pop., in 1836, 35,348. It is mostly mountainous, particularly its W. portion, where several summits rise to the height of 1,300 ft.; but on the E. side, behind the town of Zante, is an extensive and fertile vale, so covered with currant bushes (*Vitis Corinthiaca*), olive trees, cypresses, &c., as to entitle the island now, as of old, to the epithet of "woody."

Jam medio apparet fluctu nemorosa Zacynthus.  
*Zench.*, iii. 270.

"About 9,000,000 lb. currants are annually produced in this fertile vale. They are accounted better than those of Cephalonia, but inferior to those of the Morea. They are gathered in Aug., and spread out to dry for three weeks; and for this purpose a plot of ground is levelled and kept dry before every house in the valley. Much depends upon the process of drying: a shower of rain will sometimes diminish the value of the article by one third, and a second entirely ruin the crop." (*Burgess's Greece*, &c., i. 120.) The learned traveller, Dr. Chandler, has given the following details with respect to the treatment of currants, which, perhaps, may be worth quoting:—"When dried by the sun and air, they are transported to the city on horses and mules, guarded by armed peasants; and poured down a hole into magazines, where they cake together. When about to be shipped, the fruit is dug up with iron crows, and stamped into casks by men with bare legs and feet. In the ships it sweats, and, as we experienced, often fills the vessel with a stench scarcely tolerable. The islanders believe it is purchased to be used in dyeing, and in general are ignorant of the many dishes of which currants are an ingredient." (*Plants in Greece*, cap. 79.) The honey, oil, and wine of the island are much esteemed; of the latter no fewer than 40 different sorts are said to be made. Oranges, lemons, and citrons are also exported, and about 40,000 barrels of salt are annually produced from the salt works of the island. The pitch wells, visited and described by Herodotus (iv. 195.), are situated towards the S. extremity of the island, in a small plain, open on one side to the sea, but elsewhere circumscribed by hill ranges. It is, partly at least, of volcanic formation, and occasionally suffers from earthquakes, one of which, in 1840 (Oct. 30.), committed the most extensive ravages. In the wells, a dark substance is continually forcing itself from the bottom through the water, boiling up in large globules, which burst when they come to the surface. The pitch is collected with large spoon-like implements: the average annual produce is about 100 barrels, used for smearing ships' bottoms, &c.

The town of Zante, on the E. shore of the island, is the largest in the Ionian Islands, having about 20,000 inhab. (*Burgess*.) It stands partly on the level shore, and partly on some acclivities, one of which is crowned by its citadel, anciently called *Peophs*, founded by the Arcadian Zacynthus. The town, which is well kept and clean, is supplied with water by an aqueduct constructed by the British. The reflection of the sun renders it extremely hot in summer, though the heat be a good deal moderated by the action of the sea-breeze, which blows during the day. The harbour is capacious, and protected from N.E. winds by a mole, at the extremity of which a lighthouse is erected. Ships anchor opposite the town, at from 500 to 1,000 yards distance, in from 12 to 15 fathoms water. Zante is the see of a Greek protopapas, and of a Rom. Cath. bishop, and has numerous churches, two synagogues, a lazaretto, a lyceum, &c.; with some manufactures of linen, cotton, and woollen stuffs, liqueurs, soap, jewellery, &c. This town suffered severely from the earthquake already alluded to.

At the time of the Peloponnesian war, Zacynthus belonged to Athens: it was at an after period alternately a possession of the Macedonians and the Romans. Several curious antiquities have been discovered in the island, and it has been supposed that the remains of Cicero were deposited in a tomb discovered here in 1544. (See *Hughes' Travels*, i. 155, 156, &c.; *Burgess's Chandler's Greece*; *Cramer's Ancient Greece*; *Commaire*, *Dict.* &c.)

**ZARA** (an. *Jadera*), the cap. of Dalmatia, circ. of same name on the Adriatic, opposite the island Ugljan, 150 m. S.E. Venice. Lat. 44° 2' 25" N., lon. 15° 9' 30" E. Pop. about 6,500; principally of Italian descent. It stands on a small peninsula, and is fortified with bastioned walls and several outworks. It has many good private dwellings, but its streets are narrow and ill-drained, and it suffers from a deficiency of water. It has a cathedral and several other churches; 16 convents, a naval and military arsenal, and a theatre; with a lyceum, gymnasium, episcopal seminary, many inferior schools, a museum of antiquities, &c. Its harbour is spacious, but exposed to N. winds, which sometimes blow with ere-

wonderous violence. The coasting trade and fisheries employ most part of the inhab., and a great number of vessels are owned in the port. The manufacture of *rosoglio* is almost the only other branch of industry carried on, and that at present to a very limited extent. (*Ocearr. Nat. Voyag.*) Zara is an archbishop's see, the residence of a general commandant, and the seat of all the superior provincial courts of Dalmatia. Without its walls are the remains of an ancient aqueduct; but, with this exception, few other Roman antiquities exist in Zara, in consequence of their having been mostly employed in the building of the fortifications. (*Fortis's Dalmatia*, 115.; *Bergbata*, &c.)

ZEALAND, the largest and most important of the Danish islands, being that on which Copenhagen is situated. It lies mostly between the 55th and 56th degs. of N. lat., and long. 11° and 12° 40' E., at the entrance of the Baltic, being separated from Sweden by the Sound, and from Funen and Langeland by the Great Belt. Its area may be estimated at 2,830 sq. m.; pop., in 1834, including that of the small and thinly peopled islands of Moen and Samsoe, 439,962. Like the rest of the Danish islands, it is flat, or at most gently undulating, and is in parts intersected by canals. The climate is mild, and similar to that of the S. of Scotland. It is well cultivated, and is exceedingly fertile, producing grain of all sorts, especially rye, barley, oats, and wheat. The pastures are excellent, and the island is celebrated for its breed of horses. It is, also, well stocked with cattle and sheep. Wood is plentiful, except in the middle of the island, where turf is used for fuel. It is studded with cottages, farms, and country-houses; bearing a greater resemblance to England than is exhibited by most continental districts. It is also the principal seat of the manufactures and trade of Denmark. It is subdivided into 5 balliwicks, and is governed by a grand-bailiff: it forms, of itself, a separate ecclesiastical superintendency. (See DENMARK, in this work; *Ingitts*; *Brenner*, &c.)

ZEALAND (NEW), a group of 2 large and numerous small islands in the S. Pacific Ocean, belonging to the Australian continent, and now forming a dependency of the British crown. The group extends between 35° and 42° of S. lat., and 168° and 179° of E. long., about 19° E. of S. Australia and Van Diemen's Land, being the land nearest to the antipodes of Great Britain. The 2 large islands, now called New Ulster and New Munster, stretch lengthwise from N. to S., being separated by the narrow channel called Cook's Strait: a strait of about the same width separates the most southerly of the above islands from New Leinster, formerly called Stewart's or the S. island. The length of curved line extending through these 3 islands from the N. to the S. Cape would be about 900 m. The middle island, or New Munster, is the largest; but New Ulster, which alone has been colonised by the British, is the widest, being about 300 m. in its greatest breadth. Altogether, the area of New Zealand is estimated by Mr. Terry at about 86,000 sq. m., or 55,000,000 acres; and the total pop. may perhaps be 200,000, of whom nearly 10,000 are Europeans. (*Terry's New Zealand*, &c.)

The mountains of New Zealand stretch along the centre of the middle island in its whole length and along the better half of the N. island, and sloping gradually down towards the sea level, leave an immense extent of forest, plain, and pasture, on both sides of the mountain range, between it and the sea. Here and there along the line of this cordillera, several huge mountains, overtopping the rest, rise into the region of perpetual snow. Some are more than 14,000 feet high; an elevation nearly equal to that of Mont Blanc. There are likewise several subordinate ranges of hills, and a few detached outliers of vast dimensions. A few of the smaller mountains are barren, or clothed with fern; but by far the greater number are covered, up to the range of perpetual snow, by magnificent timber of enormous size and great variety. (*Present State of N. Zealand*, 178.) The country is well watered; an abundance of streams descend from the central chain on both sides. Few of the larger rivers have been surveyed to any great distance, but the Waitakato, with its affluent the Wai-pa, the Wai-hou, or Thames, and others, are of considerable size and length. The shores are in parts iron-bound and dangerous; but the N. island especially is indented with many excellent bays and harbours.

Our knowledge of the geology and mineralogy of New Zealand is very imperfect. It has, however, several active volcanoes; in the N. island, also, are various cavities, which appear to be extinct craters. In the vicinity of which numerous hot springs are met with; some of these, as they rise to the boiling-point, the natives use for cooking. (*N. Zealand*, 80.) Pumice-stone is abundant, and used by the natives for polishing their spears; coal is supposed to exist in the middle island, whence also comes the green talc of which the natives make some of their weapons. Ironstone is plentiful; some pigments used by the natives appear to consist of manganese; sulphur, white stone, slate, granite, marble, &c. are found; and in

every part hitherto explored, there is clay fitted for brick-burning.

The climate is temperate, being analogous to that of France and the S. part of England. The mean annual temperature at Auckland is about 59° Fahr., that of the summer months 67°, and of the winter months 52° (*Terry*, 667.) The country is free from the oppressive heats that prevail in the middle of the day at Sydney, and what is of still greater importance, it is not subject to the long-continued droughts that prevail in the Australian continent. Strong winds, principally from the N.E. or S.W., always occur at the changes of the moon, frequently bringing rain, particularly in the winter months: the rains, however, do not last for days together, and the W. and more prevalent winds very seldom blow so hard as to interfere with navigation. In the interior the weather is colder, but more equable. The climate appears to be generally salubrious and favourable to longevity; the prevalent diseases are mostly those which have been introduced by Europeans, though in some situations the natives suffer from scrofulous and glandular affections. (*Parl. Rep. on New Zealand*.)

The country presents the aspect of perpetual vegetation, most of its indigenous vegetable products being evergreens; and the soil, which, in most parts yet explored, is a rich loam or vegetable mould of much fertility, is apparently well adapted to the culture of nearly all the useful vegetables of Europe. However, as Mr. Terry says, "the exaggerated statements circulated in England of the colony and its products, soil, and climate, have led generally to the very erroneous impression and opinion, that the necessities of life, especially food, would be abundant and cheap. But New Zealand has neither a tropical climate, nor is it a country in which edible vegetables and fruits, indigenous to such regions, grow and flourish spontaneously and abundantly, nor is it a land inhabited by native animals adapted for the food of man, and easily obtained by the toils of the chase. The islands are, at present, uncultivated wastes, consisting either of mountains covered with dense forests, of plains and low lands covered with impenetrable high fern and shrubs, or of low marshes covered with rushes and flax, with some small spots of grass land for pasture, or of very few hills for sheep. In these vast tracts, there has been a living animal, wild or domestic; and all is produced from the soil for the food of the people, not from arable land, or of stock from pasture, and the work of time, of great labour, and of the small are and will be the resources of the colony. The produce of the islands, either of the soil, or of the animals, the substance of any great number of the natives themselves bring the land into a state of cultivation, and import cattle and sheep for the use of the colony, and for the supply of the natives."

Timber and flax are the most valuable native products. But the flax, owing to the extravagantly high rate of wages and the difficulty of the country, and the want of roads, is very high priced, even in the ports of the colony; while the freight to England, which is from 5s. to 6s. per load, amounts of itself to a prohibition of its exportation into this country. No doubt, however, its price in the colony will be progressively reduced; and being admirably adapted for ship-building, this will probably become, at no very distant date, a profitable business. Timber will, also, there can be no question, become an important article of export to Sydney, Hobart Town, and other ports in Australia. The forest trees are principally of the pine species. The kauri is of enormous size; one was cut and shipped in 1841, 150 feet in length and 25 feet in circumference at the base; and another now standing on the E. coast measures 75 feet round at its base, its height being unknown owing to the thickness of the surrounding forest.

Flax it has been supposed, will continue, for a lengthened period, to be the staple of the country. It is obtained, from the leaves, and not from the stem, of the *Phormium tenax*, an indigenous plant. It is said to be distinguished by the length, strength, and flexibility of its fibres, and to be preferable to the flax of the N. of Europe. But, in point of fact, there is a great diversity of opinion as to its real merits, and it fetches at present but a low price. It is alleged that this is a consequence of its imperfect preparation, which is left solely to the native women: they separate the fibre from the external epidermis in a green state by means of a mussel-shell, and then expose it to the air for a few days, which bleaches the flax and dries the thin inner epidermis. In heckling and properly freeing the flax afterwards from this substance, there is a loss in quantity of 25 per cent., besides the trouble and expense. But, without presuming to say whether the defects with which it is charged are inherent in the flax itself, or depend on its preparation, it is abundantly obvious that, unless it be furnished of a superior quality, it will never become a considerable article of export.

The principal food of the natives, when other kinds of

native gifts, and, in some years, they manifest fewer of the vices of savages than almost any other savage people. Their manufactures, as may be supposed, are few, and mostly confined to the furniture of their huts, articles of dress, weapons, and other necessities. But they prepare mats and other articles in flax of great beauty; they possess much ingenuity in carving and building canoes; and, with cultivation, would, perhaps, attain to a considerable degree of civilisation. They have an abundance of poetry of a lyrical kind, in a metre which appears to be regulated by a regard to quantity, and are passionately fond of music. They have also a kind of astrology; and, according to Baron Hügel, there is not a single tree, even a weed, a fish or a bird, in the N. Island, which the natives have not a name universally known. Unlike many other savages, they have evinced the greatest aptitude for sharing in the usages of civilised life; and this, probably, is a main cause of their ready adoption of the doctrines inculcated by the missionaries, and of their acquiescence in the rule of Great Britain. A considerable proportion of the natives are slaves to others, who are themselves dependent, to some extent, on certain *arcees* or head chiefs; but the holders of slaves appear, notwithstanding, to have independent control over their own lands, and are able to dispose of them at will, without the consent of the *arcees*. (See *Parl. Rep.*) Polygamy is practised by such of the New Zealanders as continue attached to their ancient superstition; but the missionaries, who have establishments in various parts of the N. Island, have, according to their own account, been eminently successful in the conversion of many of the natives to Christianity; and these have given up the practice of polygamy, cannibalism, &c.

\* If New Zealand, by the power and means of abundant and judicious emigration, becomes extensively cultivated and plentifully stocked with cattle, so as to render the necessities of life cheap, and consequently diminish, proportionally, the rate of wages, it will most probably become, in the end, the seat of extensive manufactures. In addition to moderate wages and cheap food, there would be the further important auxiliaries of coal, timber, and clay, with endless excellent localities, having water com-

munication. New Zealand would then bring into profitable production her timber, for ship-building; flax, for canvass, ropes, &c.; copper, for sheathing her ships, and all other purposes; sulphur, for brimstone, &c.; alum and dye woods, in manufacturing the wool of Australia or the cotton of India; tan, for leather from the hides of her own cattle, or from Australia and S. America; tobacco, which could be manufactured; breweries and distilleries, for barley and hops of native growth, &c. But it is far more rational to conceive that, instead of attempting fruitlessly to compete in the exports of raw produce, the colonists in the first instance will endeavour to render themselves independent of any other colony for the supply of food; and when food and labour are cheap, they will direct their capital and energies to bring into play the other natural products, in manufactures for their own wants, as well as to supply Australia, India, China, and Spanish America, all of which are not far distant." (*Terry*, pp. 259-261, &c.; *Parl. Rep. on New Zealand*; *Present State of New Zealand*; *Nicholas*; *Polack*, &c.)

**ZEITZ**, a town of Prussian Saxony, reg. Merseburg, cap. circ., on the White Elster, here crossed by a stone bridge, 22 m. W.S.W. Leipzig. Pop. 10,000. (*Berghaus*.) It is walled, is divided into an upper and lower town, and has a cathedral, and several other churches, various hospitals, two castles, one of which was formerly the residence of its princes, but now serves for a house of correction, a gymnasium, with a public library of 14,000 vols., and manufactures of cotton goods, earthenware, leather, shoes, &c.; with cotton-printing establishments, breweries, and distilleries. It is the seat of the ordinary circle courts, of an ecclesiastical board, and of a Calvinist college. The gardens and grounds in its vicinity are celebrated for their neatness, and the attention bestowed on them. (*Berghaus*; *Dict. Geog.*, &c.)

**ZELL**, or **CELLE**, a town of the Hanoverian dom., distr. Lüneburg, on the Aller, where it receives the Fuse, and on the road between Hanover and Lüneburg, 22 m. N.E. of the former. Pop. 11,200. It is well built and paved, and has Lutheran, Calvinist, and R. Catholic churches, an old castle once the residence of the Dukes of Lüneburg, a large penitentiary, a medical college, Latin school, society of agriculture, and a famous royal breeding stud. Its inhabs. manufacture linen cloths, hosiery, flannel, hats, tobacco, &c., and have a brisk transit trade both by the Aller and by land. Celle is the seat of the high court of appeal for the kingdom of Hanover, the decisions of which were final, till recently they were interfered with by the government. (*See* *HANOVER*, i. 963.)

It was the residence, during the latter years of her life, of the unfortunate Matilda, Queen of Denmark, and sister of George I. of England; and a monument to her memory stands in the palace garden. Zell has also been for a lengthened period the favourite abode of such of the nobility of Lüneburg as do not live in Hanover. (*Hodgskin*, *Travels in the N.E. of Germany*, i. 155-163.)

**ZERBST**, a town of N. Germany, territory of Anhalt-Dessau, on a small tributary of the Elbe, 17½ m. S.E. Magdeburg. Pop. 9,200. It is walled, and entered by 6 gates; has an old castle, several churches, one of which is among the finest structures of its class in Germany, two well-endowed charitable institutions, an orphan asylum, a house of correction, and a large school termed the *Franciscum*. It is the seat of the high court of appeal for the Anhalt and Schwartzburg principalities; and till near the end of last century it was the residence of the ducal family of Anhalt. It has manufactures of jewellery and earthenware. The empress Catherine II. of Russia was a princess of Zerbst; but she was not born here, as stated in the *Dict. Géographique*, but at Stettin (in 1729), of which her father was governor. (*Berghaus*; *Dict. Geog.*, &c.)

**ZITTAU**, a town of the kingdom of Saxony, circ. Bautzen, on the Mandau, a tributary of the Neisse, 50 m. E.S.E. Dresden. Pop., in 1838, 8,674. It is tolerably well built, and has numerous churches, a gymnasium, public library of 13,000 vols., house of correction, and various charitable institutions. It is the centre of the linen manufactures of Lusatia; and most of its inhabs. are occupied in the weaving of damasks, ticks, and other linen fabrics, or of cotton and woollen cloths; and in bleaching, printing, carding, and other auxiliary occupations. Zittau has also porcelain factories, paper-mills, and breweries, and a large trade in flax. It was the birthplace of the great orientalist, B. Michaelis. (*B. Ritter*; *Berghaus*, &c.)

**ZOMBOR**, a royal free town of Hungary, co. Baec, of which it is the cap., in an extensive plain near the Francis Canal, uniting the Danube and the Theiss, 118 m. E. by E. Pesth. Pop. about 21,000, mostly of the Greek church. It has several fine buildings, including a co. hall, town-house, several churches, barracks, and the government offices. Here, also, is a Greek ecclesiastical seminary, and a Rom. Cath. high school, with some silk

## ZÜRICH (CANTON OF).

manufactures, and a considerable trade in corn, wine, and cattle. (*Oesterl.*, *Nat. Encycl.*)

**ZUG** or **ZONG**, a canton, lake, and town of Switzerland, in the central part of the Confederation. The canton, which is the smallest in Switzerland, is enclosed between the territory of Zurich on the N., Schwytz on the E. and S., and a small part of Lucerne and Aargau on the W.; from which last it is separated by the Reuss. Area, about 85 sq. m.; a considerable part of which is occupied by the Lakes of Zug and Egeri. Pop., in 1837, 15,322. Except a small plain to the N. of Zug, the surface is wholly mountainous, but the mountains do not rise to any great elevation; the highest, the Rossberg, on the S. border, being little more than 5,000 ft. above the sea. Principal rivers, Reuss, Sihl, which forms the N.E. boundary, and Lortz, which brings the waters of the Egeri lake into that of Zug, and forms also the outlet of the latter towards the Reuss. The Lake of Zug, principally comprised in this canton, but partly in that of Schwytz, and intermediate in situation, as in character, between the Lakes of Zurich and Lucerne, is about 8½ m. in length, N. to S., by 3 m. in its greatest breadth. Its area has been estimated at about 10 sq. m., and the height of its surface above the level of the sea, at 1,385 Eng. ft. Its waters are of a very dark blue colour, and though near the town of Zug, its depth appears to be only about 200 ft.; at its S. extremity it is said to exceed 1,200 ft. (*Ebel*; *Pictet*, &c.)

The banks of the Lake of Zug are cultivated, richly wooded, and in general gradually sloping, except towards S. and S.W. sides, where the Righi and Rossberg rise abruptly from the water's edge. The lake abounds with fish, the taking of which forms an important occupation of the inhabs. of its vicinity. Some indifferent wine, with cider, kirschwasser, &c., are made, and considerable quantities of apples and other fruits are grown for export, but the principal employment of the pop. is in raising silk and cotton fabrics are woven, and the towns of Zug, Cham, and Baar are

The government of the canton is exercised by all the citizens, who are divided into 10 electoral districts, each electing 6 members to the cantonal council, which meets annually in the town of Zug. The council is composed of 60 members, who are elected for 6 years, and are paid by the town. The council is divided into 10 committees, each of which exercises a particular function. The chief criminal tribunal consists of 6 assessors and a president; the ordinary civil tribunal of 6 assessors and a president; the latter becomes a final court of appeal by the addition of 6 mems. chosen annually by the cantonal council. Civil causes below the amount of 12 francs, misdemeanours, and other matters of minor importance, are decided by the communal assemblies and tribunals. There is no tax of any kind in the canton. The whole state expenses, amounting to about 1604, a year, are defrayed from the general Swiss fund, drawn from the entry of foreign merchandise, and from a monopoly of salt, which is farmed by the government, and brings in about 801, a year. Zug furnishes a contingent of 250 men to the army, and 2497 francs a year to the treasury of the Swiss Confed.

**ZUG**, the cap., on the N.E. side of the lake of the same name, 15 m. S. Zurich, with about 2,500 inhabs., is the only town worth notice. It is pleasantly situated, and has several good churches, to one of which is attached a curious *golgotha*, containing many hundreds of skulls, each labelled with the name of its original possessor. Provisions are cheap at Zug; and though without the pretension to rank with Zurich in importance, a residence here would seem to be the more agreeable of the two from the greater cordiality and gaiety of the people.

The people of this canton are of a German stock, and for the most part similar to those of Schwytz, though less ignorant and superstitious. They are all R. Catholics; and, small as is the extent of the canton, Ebel says—*La pays de Zug fournit des prêtres d'une grande partie de la Suisse Catholique*. (*Pictet*, *Statistique de la Suisse*; *Ebel's Manuel*, &c.; *Ingli's Switzerland*; *Dict. Géog.*, &c.)

**ZÜRICH (CANTON OF)**, a canton of Switzerland, ranking first in the Confederation, and being superior

\* Zuinglius, or rather Zuingle, was born Jan. 1, 1484, at Badhausen, a small village in the Tockenburg. "He was a reformer," says Cox, "the mildest of the sixteenth century. He had no Zuinglian dogmas, and Zuingle seems to merit peculiar esteem. He was of a great degree that spirit of meekness, moderation, and peace, which are the characteristics of true christianity; and, amid all the dissensions between the Lutherans and the Reformed churches, was the advocate for peace and reconciliation. He was perfectly free from narrow bigotry, which makes no distinction between persons and sects, and is the cause of the most cruel persecutions and the most inconsiderate and objects of the greatest importance."
